TREATMENT: Nifurtimox, available from the Centers for Disease Control and Prevention, or benzinazole is given.

trypanosomicide Trypanocide.

trypanosomid (trī-păn′ō-sō-mĭd) A skin eruption in any disease caused by a trypanosome.

tryparsamide (trĭp-ărs′ă-mĭd, -mīd) An arsenic compound containing about 25% arsenic; used chiefly in treating sleeping sickness.

trypsin (trĭp′sĭn) [Gr. *tripsis,* friction] **1.** A proteolytic enzyme formed in the intestine from trypsinogen. It catalyzes the hydrolysis of peptide bonds in partly digested proteins and some native proteins, the final products being amino acids and various polypeptides. SEE: *chymotrypsin; digestion; enzyme; pancreas*.

crystallized t. A standardized preparation of the proteolytic enzyme trypsin. It is extracted from the pancreas of the ox, *Bos taurus.*

trypsinogen (trĭp-sĭn′ō-jĕn) [″ + *gennan,* to produce] The proenzyme or inactive form of trypsin that is released by the pancreas and converted to trypsin in the intestine.

tryptase (trĭp′tās) An enzyme released by mast cells that mediates many allergic phenomena, including anaphylaxis, asthma, conjunctivitis, and rhinitis.

tryptic (trĭp′tĭk) Rel. to trypsin.

tryptolysis (trĭp-tŏl′ĭ-sĭs) [″ + *lysis,* dissolution] The hydrolysis of proteins or their derivatives by trypsin.

tryptone (trĭp′tōn) A peptide produced by the action of trypsin on a protein.

tryptophan (trĭp′tō-făn) $C_{11}H_{12}N_2O_2$; An essential amino acid present in high concentrations in animal and fish protein. It is necessary for normal growth and development. Tryptophan is a precursor of serotonin, a neurotransmitter in the central nervous system. In high doses, it may cause nausea, vomiting, and sedation.

tryptophanase (trĭp′tō-făn-ās) An enzyme that catalyzes the splitting of tryptophan into indole, pyruvic acid, and ammonia.

tryptophanuria (trĭp″tō-fă-nū′rē-ă) [*tryptophan* + Gr. *ouron,* urine] The presence of excessive levels of tryptophan in the urine.

T.S. *test solution; triple strength.*

T/S *thyroid:serum* (thyroid to serum iodine ratio).

T score A measure of bone density in which the mass of a patient's bones are compared with the bone mass of premenopausal women. A T score that is more than 1 standard deviation (SD) from the norm identifies bone that is osteopenic. A T score that is more than 2.5 SDs identifies osteoporosis.

TSD *target skin distance.*

tsetse fly (tsĕt′sē) [S. African] One of several species of blood-sucking flies belonging to the genus *Glossina,* order Diptera, confined to Africa south of the Sahara Desert. It is an important transmitter of trypanosomes, the causative agents of African sleeping sicknesses in humans, and nagana and other diseases of cattle and game animals. SEE: *Trypanosoma; trypanosomiasis*.

TSH *thyroid-stimulating hormone.* SEE: under *hormone*.

TSH-RF *thyroid-stimulating hormone releasing factor.*

tsp *teaspoon.*

TSTA *tumor-specific transplantation antigen.*

tsutsugamushi disease (soot″soo-gă-moo′shĭ) [Japanese, dangerous bug] Scrub typhus.

TT *transit time* of blood through heart and lungs.

TTE (tē′tē′ē′) *transthoracic echocardiography*.

T-tube A device inserted into the common bile duct, most often following cholecystectomy and bile duct exploration. It has two main purposes: to allow drainage of bile, and to introduce media, when needed for post-operative biliary imaging (T-tube cholangiogram). On occasion (e.g., in distal duct obstruction due to cancer or when cholangioenterostomy is performed), the tube may be left in for a sustained period.

T.U. *toxic unit; toxin unit.*

tub (tŭb) [ME. *tubbe*] **1.** A receptacle for bathing. **2.** The use of a cold bath. **3.** To treat by using a cold bath.

tuba (too′bă) [L. *tubus,* tube] Tube.

tubal (tū′băl) [L. *tubus,* tube] Pert. to a tube, esp. the fallopian tube.

tubal nephritis An obsolete term for inflammation of kidney tubules.

tubatorsion (tū″bă-tor′shŭn) [″ + *torsio,* a twisting] The twisting of an oviduct.

tubba, tubboe (tŭb′ă, -ō) Yaws that attacks the palms and soles.

tube (tūb) [L. *tubus,* a tube] A long, hollow, cylindrical structure.

Particular tubes are listed under the first word. SEE: e.g., *endotracheal tube; fallopian tube; test tube*.

tubectomy (too-bĕk′tō-mē) Surgical removal of all or part of a tube, esp. the fallopian tube.

tube feeding Enteral tube feeding.

tuber (tū′bĕr) *pl.* **tubera** [L., a swelling] A swelling or enlargement.

t. cinereum A part of the base of the hypothalamus bordered by the mammillary bodies, the optic chiasma, and on either side by the optic tract. It is connected by the infundibulum with the posterior lobe of the pituitary.

tubercle (tū′bĕr-kl) [L. *tuberculum,* a little swelling] **1.** A small rounded elevation or eminence on a bone. **2.** A small nodule, esp. a circumscribed solid elevation of the skin or mucous membrane. **3.** The characteristic lesion resulting from infection by tubercle bacilli. It consists typically of three parts: a central giant cell, a midzone of epithelioid cells, and a peripheral zone of nonspecific structure. SEE: *tuberculosis*.

adductor t. The tubercle of the femur to which is attached the tendon of the adductor magnus.

amygdaloid t. A projection from the middle cornu of the lateral ventricle, marking the area of the amygdaloid nucleus.

articular t. The tubercle at the base of the zygomatic arch to which is attached the temporomandibular ligament; it is lateral to the articular eminence of the glenoid fossa, with which it is often confused. SYN: *zygomatic tubercle*.

condyloid t. An eminence on the mandibular condyle for the attachment of the lateral ligament of the temporomandibular joint.

deltoid t. The tubercle on the clavicle or humerus for attachment of the deltoid muscle.

dental t. A small elevation of variable size on the crown of a tooth representing a thickened area of enamel or an accessory cusp.

fibrous t. A fibrous tissue that has replaced a previously inflamed area.

genial t. The tubercle on either side of the lower jawbone.

genital t. The embryonic structure that becomes the clitoris or the penis.

Gerdy's t. SEE: *Gerdy's tubercle*.

lacrimal t. A small tubercle between the lacrimal crest and the frontal process of the maxilla.

laminated t. The cerebellar nodule.

Lisfranc's t. SEE: *Lisfranc's tubercle*.

mental t. A small tubercle on either side of the midline of the chin.

miliary t. A small tubercle resembling a millet seed, caused by tuberculosis. SEE: *tuberculosis, miliary*.

pharyngeal t. The point of attachment of the superior pharyngeal constrictor and its fibrous raphe on the inferior surface of the basilar part of the occipital bone.

pubic t. A small projection at the lateral end of the crest of the pubic bone. The inguinal ligament attaches to it.

supraglenoid t. A rough, elevated area just above the glenoid cavity of the scapula. The long head of the biceps muscle of the arm attaches to this tubercle.

t. of the upper lip The prominence of the upper part of the vermilion border that represents the distal termination of the philtrum of the upper lip.

zygomatic t. Articular t.

tubercula (tū-bĕr′kū-lă) Pl. of tuberculum.

tubercular (tū-bĕr′kū-lăr) [L. *tuberculum,* a little swelling] Relating to or marked by nodules. SYN: *tuberculate*.

tuberculate, tuberculated (tū-bĕr′kū-lāt, -lāt″ĕd) [L. *tuberculum,* a small swelling] Tubercular.

tuberculation (tū-bĕr″kū-lā′shŭn) The formation of tubercles.

tuberculid, tuberculide (tū-bĕr′kū-lĭd, -līd) [L. *tuberculum,* a little swelling] A tuberculous cutaneous eruption caused by toxins of tuberculosis. SYN: *tuberculoderma*.

follicular t. A cutaneous eruption characterized by the presence of groups of follicular lesions, esp. on the trunk.

papulonecrotic t. A form of tuberculid characterized by symmetrically distributed bluish papules, esp. on the extremities. These undergo central necrosis and, on healing, leave deep scars.

tuberculin (tū-bĕr′kū-lĭn) [L. *tuberculum,* a little swelling] A solution of purified protein derivative of tuberculosis that is injected intradermally to determine the presence of a tuberculosis infection. SEE: *tuberculin skin test*.

tuberculin skin test A test to determine the presence of infection with tuberculosis (TB). A solution containing purified protein derivative of TB is injected intradermally into the arm, and the response is read 48 to 72 hr later. A 5-mm induration is considered a positive reaction if the patient has been in close contact with persons infected with TB, is infected with human immunodeficiency virus (HIV), has risk factors for HIV, or has a chest x-ray examination that suggests a history of pulmonary TB. A 10-mm induration is considered positive in people born in nations where TB is endemic, in nursing home patients, in patients with other serious illnesses, and in people of low socioeconomic status. In all other people, a 15-mm induration is considered a positive result. A positive response indicates infection but does not distinguish between active infection and that which has been controlled by the immune system or drugs.

tuberculin tine test A tuberculin test performed by using a special disposable instrument that contains multiple sharp points or prongs for piercing the skin. These tines penetrate the skin and introduce the tuberculin that has been applied to them. The test is read in 48 to 72 hr. SYN: *tine test*.

tuberculitis (tū″bĕr-kū-lī′tĭs) Inflammation of a tubercle.

tuberculocele (tū-bĕr′kū-lō-sēl″) [″ + *kele,* tumor] Tuberculosis of the testis.

tuberculocidal (tū-bĕr″kū-lō-sī′dăl) Anything that destroys *Mycobacterium tuberculosis.*

tuberculoderma (tū-bĕr″kū-lō-dĕr′mă) [″ + Gr. *derma,* skin] Tuberculid.

tuberculofibroid (tū-bĕr″kū-lō-fī′broyd) [″ + *fibra,* fiber, + Gr. *eidos,* form, shape] Denoting fibroid degeneration of tubercles.

tuberculofibrosis (tū-bĕr″kū-lō-fī-brō′sĭs) [″ + ″ + Gr. *osis,* condition] **1.** Chronic pulmonary inflammation with formation of fibrous tissue. **2.** Interstitial pneumonia.

tuberculoid (tū-bĕr′kū-loyd) [L. *tuberculum,* a little swelling, + Gr. *eidos,* form, shape] Resembling tuberculosis or a tubercle.

tuberculoma (tū-bĕr″kū-lō′mă) [″ + Gr. *oma,* tumor] **1.** A tuberculous abscess. **2.** Any tuberculous neoplasm.

tuberculoprotein (tū-bĕr″kū-lō-prō′tē-ĭn) A protein derived from *Myobacterium tuberculosis*.

tuberculosilicosis (tū-bĕr″kū-lō-sĭl″ĭ-kō′sĭs) Silicosis and pulmonary tuberculosis at the same time.

tuberculosis (tū-bĕr″kū-lō′sĭs) [″ + Gr. *osis,* condition] ABBR: TB. An infectious disease caused by the tubercle bacillus, *Mycobacterium tuberculosis,* and characterized pathologically by inflammatory infiltration, formation of tubercles, caseation, necrosis, abscesses, fibrosis, and calcification. It most commonly affects the respiratory system, but other parts of the body such as the gastrointestinal and genitourinary tracts, bones, joints, nervous system, lymph nodes, and skin may also become infected. Fish, amphibians, birds, and mammals (esp. cattle) are subject to the disease. Three types of the tubercle bacillus exist: human, bovine, and avian. Humans may become infected by any of the three types, but in the U.S. the human type predominates. Infection usually is acquired from contact with an infected person or an infected cow or through drinking contaminated milk. In the U.S., about 10 to 15 million persons have been infected with tuberculosis. Worldwide, about 1.7 billion people harbor the infection. About 3% of cases of TB are drug resistant.

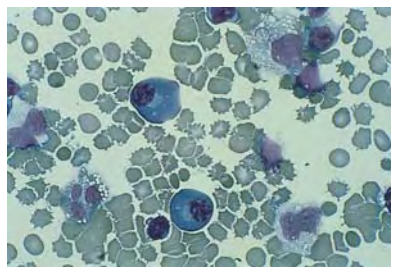
Tuberculosis usually affects the lungs, but the disease may spread to other organs including the gastrointestinal and genitourinary tracts, bones, joints, nervous system, lymph nodes, and skin. Macrophages surround the bacilli in an attempt to engulf them but cannot, producing granulomas with a soft, cheesy (caseous) core. From this state, lesions may heal by fibrosis and calcification and the disease may exist in an arrested or inactive stage. Reactivation or exacerbation of the disease or reinfection gives rise to the chronic progressive form.

The incidence of TB declined steadily from the 1950s to about 1990, when the acquired immunodeficiency syndrome epidemic, an increase in the homeless population, an increase in immigrants from endemic areas, and a decrease in public surveillance caused a resurgence of the disease. Populations at greatest risk for TB include patients with human immunodeficiency virus (HIV), Asian and other refugees, the urban homeless, alcoholics and other substance abusers, persons incarcerated in prisons and psychiatric facilities, nursing home residents, patients taking immunosuppressive drugs, and people with chronic respiratory disorders, diabetes mellitus, renal failure, or malnutrition. People from these risk groups should be assessed for TB if they develop pneumonia; all health care workers should be tested annually. SEE: illus.; *immunological therapy; tuberculin skin test; Nursing Diagnoses Appendix.*

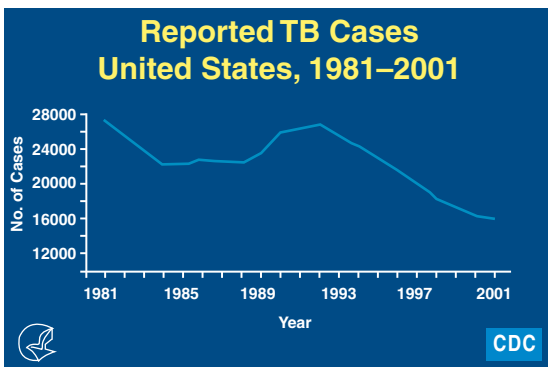
INCUBATION PERIOD: Approx. 4 to 12 weeks will elapse between the time of infection and the time a demonstrable primary lesion or positive tuberculin skin test occurs.

SYMPTOMS: Pulmonary TB produces chronic cough, sputum production, fevers, sweats, and weight loss. TB may also cause neurological disease (meningitis), bone infections, urinary bleeding, and other symptoms if it spreads to other organs.

DIAGNOSIS: A positive tuberculin skin test indicates the patient has had a tuberculous infection; however, unless repeated tests indicate a recent change from negative, it is impossible to tell how recently the infection occurred. A presumptive diagnosis of active disease is made by finding acid-fast bacilli in stained smears from sputum or other body fluids. The diagnosis is confirmed by isolating *Mycobacterium tuberculosis* on culture or rapid nucleic acid test probes.



TUBERCULOSIS
Pleural fluid with plasma cells (×1000)



TUBERCULOSIS
Reported tuberculosis cases in the United States, 1981–2001

TREATMENT: Regimens for TB have been developed for patients depending on their HIV status, the prevalence of multidrug-resistant disease in the community, drug allergies, and drug interactions. Uncomplicated TB in the non-HIV infected patient is typically treated with a four-drug regimen for 2 months (isoniazid, rifampin, ethambutol, and pyrazinamide), followed by isoniazid and rifampin for an additional 4 months. Some experts recommend a longer course of therapy in patients co-infected with HIV. To ensure compliance and prevent the evolution of drug-resistant strains of *Mycobacteria,* directly observed therapy should be used. Multidrug-resistant TB is more difficult to treat successfully. It has a mortality rate as high as 80% and may require treatment for as long as 2 years. SEE: *multidrug resistant t.*

CAUTION: All patients with HIV should be tested for TB, and all patients with TB should be tested for HIV, because about one fourth of all patients with one disease may be infected with the other.

avian t. Tuberculosis of birds caused by *Mycobacterium avium.*

bovine t. Tuberculosis of cattle caused by *Mycobacterium bovis*.

endogenous t. Tuberculosis that reactivates after a previous infection.

exogenous t. Tuberculosis originating from a source outside the body.

hematogenous t. The spread of tuberculosis from a primary site to another site via the bloodstream.

latent t. Infection with tuberculosis without active lung disease. It is detected by tuberculin skin testing.

miliary t. Tuberculosis that spreads throughout the body via the bloodstream. It may be fatal.

multidrug resistant t. ABBR: MDR-TB. *Mycobacterium tuberculosis* bacilli that are resistant to therapy with at least two standard antitubercular drugs (esp. isoniazid and rifampin, the two drugs that have formed the cornerstone of therapy for tuberculosis). MDR-TB must be treated with at least three antitubercular drugs to which the organism is presumed or proven to be sensitive. About 3% of cases of TB are drug-resistant.

open t. Tuberculosis in which the tubercle bacilli are present in bodily secretions that leave the body.

tuberculostatic (tū-bĕr″kū-lō-stăt′ĭk) Arresting the growth of the tubercle bacillus.

tuberculotic (tū-bĕr″kū-lŏt′ĭk) Concerning tuberculosis.

tuberculous (tū-bĕr′kū-lŭs) [L. *tuberculum,* a little swelling] Relating to or affected with tuberculosis, or conditions marked by infiltration of a specific tubercle, as opposed to the term *tubercular,* referring to a nonspecific tubercle.

tuberculum (tū-bĕr′kū-lŭm) *pl.* **tubercula** [L. *tuberculum,* a little swelling] A small knot or nodule; a tubercle.

t. acusticum The dorsal nucleus of the cochlear nerve.

t. impar A small median eminence on the floor of the embryonic oral cavity, the precursor of the tongue, though it is not a distinct part of the tongue after birth.

t. majus humeri The larger tuberosity of the humerus at the upper end of its lateral surface, giving attachment to the infraspinatus, supraspinatus, and teres minor muscles.

t. minus humeri The projection at the proximal end of the anterior humerus, providing attachment to the subscapularis muscle.

tuberosis (tū″bĕr-ō′sĭs) A condition in which nodules develop; a nonspecific term that indicates no specific disease process.

tuberositas (tū-bĕr-ŏs′ĭt-ăs) *pl.* **tuberositates** [L.] A projection, nodule, or prominence.

tuberosity (tū-bĕr-ŏs′ĭ-tē) [L. *tuberositas,* tuberosity] **1.** An elevated round process of a bone. **2.** A tubercle or nodule.

ischial t. A palpable prominence on the inferior margin of the ischium that supports a person's weight when sitting.

maxillary t. A rounded eminence on the posteroinferior surface of the maxilla that enlarges with the development and eruption of the third molar. It articulates medially with the palatine bone and laterally with the lateral pterygoid process of the sphenoid. It forms the anterior surface of the pterygopalatine fossa, including a groove for the passage of the maxillary nerve, which is anesthetized in this region for a maxillary or second-division block.

tuberous (tū′bĕr-ŭs) Pert. to tubers.

tubo- Combining form meaning *tube.*

tuboabdominal (tū″bō-ăb-dŏm′ĭn-ăl) [L. *tubus,* tube, + *abdominalis,* pert. to the abdomen] Pert. to the fallopian tubes and the abdomen.

tubocurarine chloride (tū″bō-kū-ră′rĭn klō′rīd) A drug used to produce skeletal muscle relaxation during anesthesia and convulsive states and to treat poisoning caused by black widow spider bites. Tubocurarine was originally obtained from the Indian arrow poison, curare.

CAUTION: Tubocurarine should be administered only by those who have the proper equipment and are fully capable of providing artificial ventilation, tracheal intubation, appropriate antidotes, and additional therapy in case of overdose.

tuboligamentous (tū″bō-lĭg-ă-mĕn′tŭs) [″ + *ligamentum,* a band] Pert. to the fallopian tube and broad ligament of the uterus.

tubo-ovarian (tū″bō-ō-vā′rē-ăn) [″ + LL. *ovarium,* ovary] Pert. to the fallopian tube and the ovary.

tubo-ovariotomy (tū″bō-ō-vā-rē-ŏt′ō-mē) [″ + LL. *ovarium,* ovary, + Gr. *tome,* incision] Excision of ovaries and oviducts.

tubo-ovaritis (tū″bō-ō″vă-rī′tĭs) [″ + ″ + Gr. *itis,* inflammation] Inflammation of the ovary and fallopian tube.

tuboperitoneal (tū″bō-pĕr-ĭ-tō-nē′ăl) [″ + Gr. *peritonaion,* peritoneum] Rel. to the fallopian tube and peritoneum.

tuboplasty (tū′bō-plăs″tē) **1.** Plastic repair of any tube. **2.** Plastic repair of a fallopian tube or tubes in an attempt to restore patency so that fertilization of the ovum may occur. SYN: *salpingoplasty*.

tuboplasty, transcervical balloon Catheterization and dilation of the fallopian tubes, a method of treating infertility in women whose fallopian tubes are occluded proximally. A balloon catheter is inserted through the cervical os of the uterus and into the fallopian tube to the point of occlusion in the tube. The balloon is then expanded by filling it with sterile saline. This dilation of the tube may restore tubal patency. SEE: *catheter, balloon; infertility*.

tuborrhea (tū-bor-rē′ă) [″ + Gr. *rhoia,* flow] Discharge from the eustachian tube.

tubotorsion (tū″bō-tor′shŭn) The act of twisting a tube.

tubotympanal (tū″bō-tĭm′pă-năl) [″ + Gr. *tympanon,* a drum] Rel. to the tympanum of the ear and the eustachian tube.

tubouterine (tū″bō-ū′tĕr-ĭn) [″ + *uterinus,* pert. to the uterus] Rel. to the fallopian tube and the uterus.

tubovaginal (tū″bō-văj′ĭ-năl) Concerning the fallopian tube and vagina.

tubular (tū′bū-lăr) [L. *tubularis,* like a tube] Rel. to or having the form of a tube or tubule.

tubule (tū′būl) [L. *tubulus,* a tubule] A small tube or canal.

Bellini's t. SEE: *Bellini's tubule*.

collecting t. One of the small ducts that receive urine from several renal tubules, which join together to provide a passage for the urine to larger straight collecting tubules (papillary ducts of Bellini) that open into the pelvis of the kidney. SEE: *kidney* for illus.

convoluted t. of the kidney The proximal and distal convoluted tubules of the nephron that, with the loop of Henle and collecting tubule, form the renal tubule through which the glomerular filtrate passes before entering the renal pelvis. SEE: *kidney* for illus.; *nephron*.

convoluted seminiferous t. One of the tubules present in each lobe of the testes.

dentinal t. One of the very small canals in the dentin. These extend from the pulp cavity of the tooth to the enamel and are occupied by odontoblastic processes and occasional nerve filaments.

excretory t. Renal tubule.

galactophorous t. Lactiferous tubule.

Henle's t. Henle's loop.

junctional t. The short segment of a renal tubule that connects the distal convoluted tubule with the collecting tubule.

lactiferous t. One of the lactiferous ducts of the breast. It provides a channel for the milk formed in the lobes of the breast to pass to the nipple. SYN: *galactophorous tubule*.

mesonephric t. One of the embryonic tubules that in the female gives rise

only to vestigial structures but in the male gives rise to the efferent ducts of the testes. SYN: *wolffian tubule*.

renal t. The part of a nephron through which renal filtrate from the renal corpuscle flows and is changed to urine by reabsorption and secretion. The parts, in order, are the proximal convoluted tubule, the loop of Henle, the distal convoluted tubule, and collecting tubule. SYN: *excretory tubule*. SEE: *kidney* for illus; *nephron*.

seminiferous t. One of the very small channels of the testes in which spermatozoa develop and through which they leave the testes.

transverse t. ABBR: T-tubule. An invagination of the cell membrane of a muscle fiber that carries the action potential to the interior of the cell and the innermost sarcomeres.

uriniferous t. SEE: *renal t.*

tubulin (tū′bū-lĭn) A protein present in the microtubules of cells.

tubulization (too″bū-lī-zā′shŭn) A method of repairing severed nerves in which the nerve ends are placed in a tube of absorbable material.

tubuloalveolar (too″bū-lō-ăl-vē′ō-lăr) Consisting of tubes and alveoli, as in a tubuloalveolar salivary gland.

tubulocyst (too′bū-lō-sĭst) The cystic dilatation of a functionless duct or canal.

tubulodermoid (tū″bū-lō-dĕr′moyd) [″ + Gr. *derma,* skin, + *eidos,* form, shape] A dermoid tumor caused by the persistent embryonic tubular structure.

tubuloracemose (too″bū-lō-răs′ĕ-mōs) Pert. to a gland that has tubular and racemose characteristics.

tubulorrhexis (too″bū-lō-rĕk′sĭs) [″ + *rhexis,* a breaking] Focal ruptures of renal tubules.

tubulus (tū′bū-lŭs) *pl.* **tubuli** [L.] A tubule.

tubus (too′bŭs) [L.] Tube.

t. digestorius The alimentary canal.

tuft (tŭft) A small clump, cluster, or coiled mass.

enamel t. An abnormal structure formed in the development of enamel, consisting of poorly calcified twisted rods.

malpighian t. An outdated term for the renal glomerulus.

tugging A dragging or pulling.

tracheal t. SEE: *tracheal tugging*.

tularemia (tū-lăr-ē′mē-ă) [*Tulare,* part of California where disease was first discovered] An acute plaguelike infectious disease caused by *Francisella tularensis*. It is transmitted to humans by the bite of an infected tick or other bloodsucking insect, by direct contact with infected animals, by eating inadequately cooked meat, or by drinking water that contains the organism. Streptomycin or gentamicin is effective in treating the disease. SYN: *deer fly fever; rabbit fever*.

SYMPTOMS: The incubation period is 2 to 10 days; symptoms include headache, fever, chills, vomiting, and body aches.

tumbu fly A species of fly belonging to the genus *Cordylobia* in Africa and the genus *Dermatobia* in tropical America. Their larvae develop in the skin of wild domesticated animals, and humans are frequently attacked.

tumefacient (tū-mĕ-fā′shĕnt) [L. *tumefaciens,* producing swelling] Producing or tending to produce swelling; swollen.

tumefaction (tū″mĕ-făk′shŭn) [L. *tumefactio,* a swelling] Intumescence.

tumentia (tū-mĕn′shē-ă) [L.] Swelling.

vasomotor t. Irregular swellings in the lower extremities associated with vasomotor disturbances.

tumescence (tū-mĕs′ĕns) **1.** A condition of being swollen or tumid. **2.** A swelling.

tumor (tū′mor) [L. *tumor,* a swelling] **1.** A swelling or enlargement; one of the four classic signs of inflammation. **2.** An abnormal mass. Growth or proliferation that is independent of neighboring tissues is a hallmark of all tumors, benign and malignant. SYN: *neoplasm*. SEE: *cancer*.

brain t. An inexact term to describe any intracranial mass—neoplastic, cystic, inflammatory (abscess), or syphilitic. SEE: illus.; *Nursing Diagnoses Appendix.*

BRAIN TUMOR

PATIENT CARE: The patient is evaluated for neurological deficits, such as weakness, sensory losses, or disturbances of vision, speech, gait, or balance. The patient is monitored for seizure activity and for increased intracranial pressure (ICP).

If the patient is aphasic or develops dysphagia, a speech pathologist is consulted. Emotional support is provided to

the patient and family as they struggle to cope with treatments, disabilities, changes in lifestyle, and end-of-life issues. The patient and family are referred to resource and support services (e.g., social service, home health care agencies, the American Cancer Society, and other such voluntary agencies).

Brenner's t. SEE: *Brenner's tumor*.

brown t. A benign fibrotic mass found within the bone of patients with unchecked hyperparathyroidism. The tumor appears brown on gross examination because it contains blood and byproducts of the metabolism of hemoglobin, such as hemosiderin.

Buschke-Loewenstein t. A giant condyloma acuminata, typically found on the genitals or anus, caused by infection with papilloma virus. In men, it is almost always found under the foreskin (it is rarely reported in circumcised men). It may transform into a verrucous carcinoma and cause deep local tissue invasion.

calcifying epithelial odontogenic t. Pindborg tumor.

carotid body t. A benign tumor of the carotid body.

collision t. **1.** A malignant growth made up of two or more different cell types occurring simultaneously in the same location. **2.** A cancerous growth made up of two or more malignancies that have metastasized toward each other.

connective tissue t. Any tumor of connective tissue such as fibroma, lipoma, chondroma, or sarcoma.

desmoid t. A tumor of fibrous connective tissue. SYN: *desmoma*.

erectile t. A tumor composed of erectile tissue.

false t. An enlargement due to hemorrhage into tissue or extravasation of fluid into a space, rather than cancer.

fibroid t. Uterine fibroma.

follicular t. A sebaceous cyst.

functioning t. A tumor that is able to synthesize the same product as the normal tissues from which it arises, esp. an endocrine or nonendocrine tumor that produces hormones.

giant cell t. **1.** A malignant or benign bone tumor that probably arises from connective tissue of the bone marrow. Histologically, it contains a vascular reticulum of stromal cells and multinucleated giant cells. **2.** A yellow giant cell tumor of a tendon sheath. **3.** Epulis. **4.** Chondroblastoma.

giant cell t. of bone A benign or malignant tumor of bone in which the cells are multinucleated and surrounded by cellular spindle cell stroma.

giant cell t. of tendon sheath A localized nodular tenosynovitis.

granulosa cell t. An estrin-secreting neoplasm of the granulosa cells of the ovary.

granulosa-theca cell t. An estrogen-secreting tumor of the ovary made up of either granulosa or theca cells.

Gubler's t. SEE: *Gubler's tumor*.

heterologous t. A tumor in which the tissue differs from that in which it is growing.

homologous t. A tumor in which the tissue resembles that in which it is growing.

Hürthle cell t. SEE: *Hürthle cell tumor*.

islet cell t. A tumor of the islets of Langerhans of the pancreas.

Klatskin t. SEE: under *Klatskin*.

Krukenberg's t. SEE: *Krukenberg's tumor*.

lipoid cell t. of the ovary A masculinizing tumor of the ovary. It may be malignant.

mast cell t. A benign nodular accumulation of mast cells.

melanotic neuroectodermal t. A benign tumor of the jaw, occurring mostly during the first year of life.

mesenchymal mixed t. A tumor composed of tissue that resembles mesenchymal cells.

milk t. A colloquial term for a galactocele. SYN: *galactocele* (1). SEE: *caked breast*.

Pancoast's t. SEE: *Pancoast's tumor*.

papillary t. Neoplasm composed of or resembling enlarged papillae. SEE: *papilloma*.

phantom t. **1.** An apparent tumor due to muscular contractions or flatus that resolves on re-examination of the patient. **2.** A mass that resembles a tumor in only one view of a chest x-ray film. On other views it either disappears or appears to be an encapsulated fluid collection.

t. of pregnancy The abdominal swelling produced by the growing conceptus of pregnancy.

primary t. In a patient with metastatic cancer, the lesion assumed to be the source of the metastases.

Recklinghausen t. SEE: under *Recklinghausen, Friedrich D. von*.

sand t. Psammoma.

teratoid t. Tumor of embryonic remains from all germinal layers. SEE: *teratoma*.

turban t. Multiple cutaneous cylindromata that cover the scalp like a turban.

vascular t. Hemangioma.

Warthin's t. SEE: *Warthin's tumor*.

Wilms' t. SEE: *Wilms' tumor*.

tumoraffin (tū′mor-ăf-ĭn) [L. *tumor,* a swelling, + *affinis,* related] Having an affinity for tumor cells.

tumor angiogenesis factor ABBR: TAF. A protein present in animal and human cancer tissue that in experimental stud-

ies appears to be essential to growth of the cancer. The substance is thought to act by stimulating the growth of new blood capillaries for supplying the tumor with nutrients and removing waste products.

tumor burden The sum of cancer cells present in the body.

tumoricidal (too″mor-ĭ-sī′dăl) Lethal to neoplastic cells.

tumorigenesis (too″mor-ĭ-jĕn′ĕ-sĭs) The production of tumors.

tumorigenic (tū″mor-ĭ-jĕn′ĭk) [″ + Gr. *genesis,* generation, birth] Forming and developing tumors.

tumorlet A small growth (e.g., in the lungs or uterus), usually made of smooth muscle or neuroendocrine cells.

tumor marker A substance whose presence in blood serum serves as a biochemical indicator for the possible presence of a malignancy. Examples of markers and the malignancies they may indicate are carcinoembryonic antigen for cancers of the colon, lung, breast, and ovary; beta subunit of chorionic gonadotropin for trophoblastic and testicular tumors; alpha-fetoprotein for testicular teratocarcinoma and primary hepatocellular carcinoma; and prostate-specific antigen for prostate cancer.

tumor necrosis factor ABBR: TNF. A protein mediator or cytokine released primarily by macrophages and T lymphocytes that helps regulate the immune response and some hematopoietic functions. There are two factors: alpha (TNFα), also called cachectin, produced by macrophages, and beta (TNFβ), called lymphotoxin, which is produced by activated CD4+ T cells. The functions of TNF are very similar to those of interleukin-1. A monoclonal antibody against TNFα, infliximab, is used in the treatment of rheumatoid arthritis and other diseases in which TNFα causes inflammatory damage. SEE: *cytokine; interleukin-1*.

tumor necrosis factor receptor-associated periodic syndrome ABBR: TRAPS. A rare, dominantly inherited autoinflammatory disorder marked by bouts of abdominal pain, fever, myalgia and arthralgia, pleurisy, and conjunctivitis. It is caused by a mutation in a cell receptor for tumor necrosis factor. SEE: *tumor necrosis factor*.

tumorous (too′mor-ŭs) Tumor-like.

tumultus (tū-mŭl′tŭs) [L.] Excessive or agitated activity.

t. cordis Irregular heart action with palpitation.

t. sermonis Extreme stuttering due to a pathological cause.

Tunga (tŭng′ă) A genus of fleas of the family Hectopsyllidae.

T. penetrans A small flea common in tropical regions. It infests humans, cats, dogs, rats, pigs, and other animals and produces a severe local inflammation frequently liable to secondary infection.

tungiasis (tŭng-gī′ă-sĭs) Infestation of the skin with *Tunga penetrans*.

tungsten (tŭng′stĕn) SYMB: W (for wolfram). A metallic element; atomic weight, 183.85; atomic number, 74.

tunic (tū′nĭk) [L. *tunica,* a sheath] A layer of tissue.

Bichat's t. Tunica intima.

tunica (tū′nĭ-kă) *pl.* **tunicae** [L. *tunica,* a sheath] A layer, or coat, of tissue.

t. adventitia The outermost fibroelastic layer of a blood vessel or other tubular structure. SYN: *tunica externa*.

t. albuginea The white fibrous layer of the eye, testicle, ovary, or spleen.

t. conjunctiva Conjunctiva.

t. dartos The muscular, contractile tissue beneath the skin of the scrotum.

t. externa Tunica adventitia.

t. interna SEE: *t. intima*.

t. intima The lining of a blood vessel composed of an epithelial (endothelium) layer and the basement membrane, a subendothelial connective tissue layer, and usually an internal elastic lamina. SYN: *Bichat's tunic*.

t. media The middle layer in the wall of a blood vessel composed of circular or spiraling smooth muscle and some elastic fibers.

t. mucosa The mucous membrane lining of various structures.

t. muscularis The smooth muscle layer in the walls of organs such as the bronchi, intestines, and blood vessels.

t. serosa The membrane lining the walls of the closed body cavities and folded over the organs in those cavities, forming the outermost layer of the wall of these organs. The body cavities are the thoracic, abdominal, and pericardial cavities.

t. vaginalis The serous membrane surrounding the front and sides of the testicle.

t. vasculosa Any vascular layer.

tuning fork A device that vibrates at a specific frequency when it is struck, e.g., 128, 256, or 512 Hz. It is used in simple tests of hearing and vibration sense.

tunnel (tŭn′ĕl) A narrow channel or passageway.

carpal t. The canal in the wrist bounded by osteofibrous material through which the flexor tendons and the median nerve pass. SYN: *flexor tunnel*.

flexor t. Carpal t.

inner t. The triangular canal lying between the inner and outer pillars of Corti in the organ of Corti of the inner ear.

tarsal t. The osteofibrous canal in the tarsal area bounded by the flexor retinaculum and tarsal bones. The posterior tibial vessels, tibial nerve, and flexor tendons pass through this tunnel.

Tuohy needle (too′hē ne-dil) A needle with a curved point that is used in epidural anesthesia. The curve reduces the possibility that the point of the needle and the anesthetic will enter the dura mater.

TUR *transurethral resection* (of the prostate).

turbid (tŭr′bĭd) [L. *turba,* a tumult] Cloudy; not clear. SEE: *turbidity*.

turbidimeter (tŭr-bĭ-dĭm′ĕ-ter) [L. *turbidus,* disturbed, + Gr. *metron,* measure] A device for estimating the degree of turbidity of a fluid.

turbidimetry (tŭr-bĭ-dĭm′ĕ-trē) [″ + Gr. *metron,* measure] Estimation of the turbidity of a liquid.

turbidity (tŭr-bĭd′ĭ-tē) [L. *turbiditas,* turbidity] Opacity due to the suspension of flaky or granular particles in a normally clear liquid.

turbinal (tŭr′bĭ-năl) [L. *turbinalis,* fr. *turbo,* a child's top] Shaped like an inverted cone.

turbinate (tŭr′bĭ-n-āt) [L. *turbinalis,* fr. *turbo,* a child's top] **1.** Shaped like an inverted cone. **2.** A concha; a scroll-like bone on the lateral wall of the nasal cavity.

turbinated (tŭr′bĭ-nā″tĕd) [L. *turbo,* whirl] Top-shaped or cone-shaped. SEE: *concha*.

turbinectomy (tŭr-bĭn-ĕk′tō-mē) [″ + Gr. *ektome,* excision] Excision of a turbinated bone.

turbinoplasty (tŭr-bĭn′ō-plăs-tē) Reduction of the size of the nasal turbinates. The surgery is used occasionally in the management of snoring and airflow disorders.

turbinotome (tŭr-bĭn′ō-tōm) [″ + Gr. *tome,* incision] An instrument for excision of a turbinated bone.

turbinotomy (tŭr-bĭn-ŏt′ō-mē) [″ + Gr. *tome,* incision] Surgical incision of a turbinated bone.

Turcot syndrome An autosomal recessive syndrome in which multiple colonic polyps are found in conjunction with malignant brain tumors.

turgescence (tŭr-jĕs′ĕns) [L. *turgescens,* swelling] Swelling or enlargement of a part.

turgescent (tŭr-jĕs′ĕnt) [L. *turgescens,* swelling] Swollen; inflated.

turgid (tŭr′jĭd) [L. *turgidus,* swollen] Swollen; bloated.

turgometer (tŭr-gŏm′ĕ-tĕr) [L. *turgor,* swelling, + Gr. *metron,* measure] A device for measuring turgescence.

turgor (tŭr′gor) [L., a swelling] **1.** Normal tension in a cell. **2.** Distention, swelling.

skin t. The resistance of the skin to deformation, esp. to being grasped between the fingers. In a healthy person, when the skin on the back of the hand is grasped between the fingers and released, it returns to its normal appearance either immediately or relatively slowly. The state of hydration of the skin can determine which of these reactions occurs, but age is the most important factor. As a person ages, the skin returns much more slowly to its normal position after having been pinched between the fingers. The skin over the forehead or sternum may be used when assessing turgor in elderly persons.

t. vitalis Normal fullness of the capillaries and blood vessels.

turista (tū-rēs′tă) [Sp.] One of the many colloquial names applied to travelers' diarrhea, esp. that which occurs in tourists in Mexico.

Türk's irritation cell A cell resembling a plasma cell, found in cases of severe anemia or chronic infection.

Turner's syndrome [Henry Hubert Turner, U.S. physician, 1892–1970] Gonadal dysgenesis.

turning [AS. *turnian,* to turn] **1.** Rotating to change position. **2.** Version (2).

turpentine (tŭr′pĕn-tīn) [Gr. *terebinthos,* turpentine tree] Oleoresin obtained from various species of pine trees. It is a mixture of terpenes and other hydrocarbons obtained from pine trees. It was once used in liniments and counterirritants.

turunda (tū-rŭn′dă) [L.] **1.** A surgical tent, drain, or tampon. **2.** A suppository.

tussal (tŭs′ăl) [L. *tussis,* cough] Tussive.

tussicular (tŭ-sĭk′ū-lăr) [L. *tussis,* cough] Pert. to a cough.

tussiculation (tŭ-sĭk″ū-lā′shŭn) A short, dry cough.

tussis (tŭs′ĭs) [L.] Cough.

tussive (tŭs′ĭv) [L. *tussis,* cough] Relating to a cough. SYN: *tussal*.

tutamen (tū-tā′mĕn) *pl.* **tutamina** [L.] Any tissue that has a protective action.

tutamina oculi The structures around the eye that protect it: the eyebrows, eyelids, and eyelashes.

twelfth cranial nerve The hypoglossal nerve, motor to muscles of the tongue. SEE: *cranial nerve; hypoglossal nerve*.

twig The final branch of a structure such as a nerve or vessel.

twilight sleep A state of partial anesthesia and hypoconsciousness in which pain sense has been greatly reduced by the injection of morphine and scopolamine. The patient responds to pain, but afterward the memory of the pain is dulled or effaced. Although once in common use as a method of analgesia for childbirth and minor surgery, twilight sleep has been replaced by more effective contemporary approaches to pain control.

twilight state A state in which consciousness is disordered and autonomic dysfunction or dissociation may occur. This may occur in epilepsy.

twin (twĭn) [AS. *twinn*] One of two children developed within the uterus at the same time from the same pregnancy. SEE: illus.; *fetus papyraceus; Hellin's law*.

INCIDENCE: Per 1000 live births, incidence rates for American whites are 1:88; for American blacks, 1:70. Generally, the rates are higher in blacks and East Indians and lower in Northern Europeans.

RESEARCH ON TWINS: Identical and fraternal twins provide a unique resource for investigating the origin and natural history of various diseases and discovering the different rates of environmental and hereditary factors in causing physical and mental disorders. Esp. important are studies that follow the course of identical twins separated shortly after birth and who then grew up in different social, economic, educational, and environmental conditions. In other research, the second-born twin was found to be at increased risk for an unfavorable outcome (e.g., need for intubation and resuscitation, lower 5-min Apgar score), even when delivered by cesarean section.

biovular t. Dizygotic twins.

conjoined t. Twins that are united. SEE: *Siamese twins*.

dizygotic t. Twins from two separate ova fertilized at the same time. SYN: *biovular twins; fraternal twins*.

enzygotic t. Monozygotic twins.

fraternal t. Dizygotic twins.

growth discordant t. The unequal growth of twins while in utero. The smaller twin is at greater risk of having congenital anomalies than is the normal birth-weight twin. SYN: *unequal twins*.

identical t. Monozygotic twins.

impacted t. Twins so entwined in utero as to prevent normal delivery.

interlocked t. Twins in which the neck of one becomes interlocked with the head of the other, making vaginal delivery impossible.

monozygotic t. Twins that develop from a single fertilized ovum. Monozygotic twins have the same genetic makeup and, consequently, are of the same gender and strikingly resemble each other physically, physiologically, and mentally. They develop within a common chorionic sac and have a common placenta. Each usually develops its own amnion and umbilical cord. Such twins may result from development of two inner cell masses within a blastocyst, development of two embryonic axes on a single blastoderm, or the division of a single embryonic axis into two centers. SYN: *enzygotic twins; identical twins; true twins; uniovular twins*.

parasitic t. The smaller of a pair of conjoined twins, when there is a marked disparity in size.

true t. Monozygotic twins.

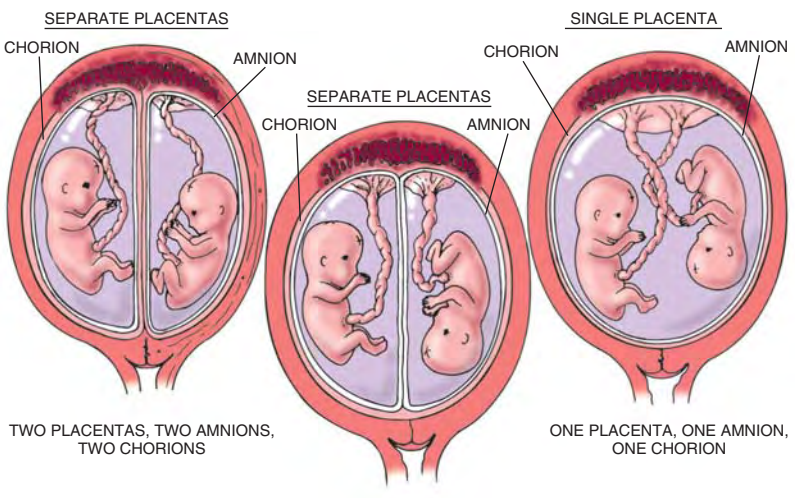
unequal t. Growth discordant twins.

uniovular t. Monozygotic twins.

vanishing t. Fetal resorption in multiple gestation. SEE: *gestation, multiple*.

twinge (twĭnj) [AS. *twengan,* to pinch] A sudden keen pain.

twinning (twĭn′ĭng) Delivery of or producing twins.



POSSIBLE RELATIONS OF FETAL MEMBRANES IN TWIN PREGNANCIES

twitch (twĭch) [ME. *twicchen*] **1.** A single contraction of one muscle fiber in response to one nerve impulse. SEE: *myokymia*. **2.** To jerk convulsively.

twitching (twĭch′ĭng) Repeated contractions of portions of muscles.

two-point discrimination test A test of cutaneous sensation involving determination of the ability of the patient to detect that the skin is being touched by two pointed objects at once. It is used to determine the degree of sensory loss following disease or trauma affecting the nervous system.

two-way interactive television ABBR: IATV. A means of telecommunication used to link two geographically distant sites via real-time audio and visual media.

TXA_2 *thromboxane A_2*.

tylectomy (tī-lĕk′tō-mē) [Gr. *tylos,* knot, + *ektome,* excision] Lumpectomy.

tylion (tĭl′ē-ŏn) [Gr. *tyleion,* knot] The point at the middle of the anterior edge of the optic groove.

tyloma (tī-lō′mă) [Gr. *tylos,* knot, + *oma,* tumor] A callosity.

tylosis (tī-lō′sĭs) [″ + *osis,* condition] Formation of a callus.

tympan- SEE: *tympano-*.

tympanal (tĭm′păn-ăl) [Gr. *tympanon,* drum] Tympanic (1).

tympanectomy (tĭm″păn-ĕk′tō-mē) [″ + *ektome,* excision] Excision of the tympanic membrane.

tympanic (tĭm-păn′ĭk) [Gr. *tympanon,* drum] **1.** Pert. to the tympanum. SYN: *tympanal*. **2.** Resonant. SYN: *tympanitic* (2).

tympanism (tĭm′păn-ĭzm) [Gr. *tympanon,* drum, + *-ismos,* condition] Tympanites.

tympanites (tĭm-păn-ī′tēz) [Gr., distention] Distention of the abdomen or intestines due to the presence of gas. SYN: *meteorism; tympanism; tympanosis*.

tympanitic (tĭm-păn-ĭt′ĭk) **1.** Pert. to or characterized by tympanites. **2.** Tympanic (2).

tympanitis (tĭm-păn-ī′tĭs) [Gr. *tympanon,* drum, + *itis,* inflammation] Otitis media.

tympano-, tympan-, myringo-, myring- [Gr. *tympanon,* drum] Combining forms meaning *tympanic membrane* or *eardrum*.

tympanocentesis (tĭm″pă-nō-sĕn-tē′sĭs) Drainage of fluid from the middle ear by using a small gauge needle to puncture the tympanic membrane. The fluid is cultured to determine the identity of any microbes that may be present.

tympanoeustachian (tĭm″pă-nō-ū-stā′kē-ăn) Concerning the tympanic cavity and eustachian tube.

tympanography (tĭm″pă-nŏg′ră-fē) Radiographic examination of the eustachian tubes and middle ear after introduction of a contrast medium.

tympanohyal (tĭm″pă-nō-hī′ăl) Concerning the tympanic cavity and hyoid arch.

tympanomalleal (tĭm″pă-nō-măl′ē-ăl) Concerning the tympanic membrane and malleus.

tympanomandibular (tĭm″pă-nō-măn-dĭb′ū-lăr) Concerning the middle ear and mandible.

tympanomastoiditis (tĭm″păn-ō-măs″toy-dī′tĭs) [″ + *mastos,* breast, + *eidos,* form, shape, + *itis,* inflammation] Inflammation of the tympanum and mastoid cells.

tympanometry (tĭm″pă-nŏm′ĕ-trē) A procedure for objective evaluation of the mobility and patency of the eardrum and for detection of middle-ear disorders and patency of the eustachian tubes. SEE: *audiometry*.

tympanoplasty (tĭm″păn-ō-plăs′tē) [″ + *plassein,* to form] Any one of several surgical procedures designed either to cure a chronic inflammatory process in the middle ear or to restore function to the sound-transmitting mechanism of the middle ear. SEE: *Nursing Diagnoses Appendix.*

tympanosclerosis (tĭm″pă-nō-sklĕ-rō′sĭs) Infiltration by hard fibrous tissue around the ossicles of the middle ear.

tympanosis (tĭm-pă-nō′sĭs) [″ + *osis,* condition] Tympanites.

tympanosquamosal (tĭm″pă-nō-skwă-mō′săl) Concerning the tympanic and squamosal portions of the temporal bone.

tympanostapedial (tĭm″pă-nō-stă-pē′dē-ăl) Concerning the tympanic cavity and stapes.

tympanostomy (tĭm″pă-nŏs′tō-mē) Myringotomy.

tympanostomy tube A tube placed through the tympanic membrane of the ear to allow ventilation of the middle ear as part of the treatment of otitis media with effusion. SYN: *grommet*. SEE: *otitis media with effusion*.

tympanotemporal (tĭm″pă-nō-tĕm′pō-răl) Concerning the tympanic cavity and area of the temporal bone.

tympanotomy (tĭm″păn-ŏt′ō-mē) [″ + *tome,* incision] Incision of the tympanic membrane. SYN: *myringotomy*.

tympanous (tĭm′păn-ŭs) [Gr. *tympanon,* a drum] Marked by abdominal distention with gas.

tympanum (tĭm′păn-ŭm) [L.; Gr. *tympanon*] The middle ear or tympanic cavity. SYN: *cavum tympani; eardrum*. SEE: *ear, middle*.

tympany (tĭm′pă-nē) **1.** Abdominal distention with gas. **2.** Tympanic resonance on percussion. It is a clear hollow note like that of a drum. It indicates a pathological condition of the lung or of a cavity.

type (tīp) [Gr. *typos,* mark] The general character of a person, disease, or substance.

asthenic t. Having a thin, flat, long-chested body build with poor muscular development.

athletic t. Having broad shoulders, a deep chest, flat abdomen, thick neck, and powerful muscular development.

blood t. Blood group.

body t. Classification of the human body according to muscle and fat distribution. SEE: *ectomorph; endomorph; mesomorph; somatotype*.

phage t. Distinguishing subgroups of bacteria by the type of bacteriophage associated with that specific bacterium.

pyknic t. Having a rounded body, large chest, thick shoulders, broad head, thick neck, and usually short stature.

typhlectasis (tĭf-lĕk′tă-sĭs) [Gr. *typhlon,* cecum, + *ektasis,* dilatation] Cecal distention.

typhlectomy (tĭf-lĕk′tō-mē) [″ + *ektome,* excision] Excision of the cecum. SYN: *cecectomy*.

typhlenteritis (tĭf″lĕn-tĕr-ī′tĭs) [″ + *enteron,* intestine, + *itis,* inflammation] Inflammation of the cecum. SYN: *typhlitis*.

typhlitis (tĭf-lī′tĭs) [″ + *itis,* inflammation] Inflammation of the cecum. It is often encountered during profound chemotherapy-induced neutropenia. SYN: *typhlenteritis*.

typhlodicliditis (tĭf″lō-dĭk-lĭ-dī′tĭs) [″ + *diklis,* door, + *itis,* inflammation] Inflammation of the ileocecal valve.

typhloenteritis (tĭf″lō-ĕn-tĕr-ī′tĭs) [″ + *enteron,* intestine, + *itis,* inflammation] Cecitis.

typhlon (tĭf′lŏn) [Gr.] Cecum.

typho- [Gr. *typhos,* fever] Combining form meaning *fever, typhoid.*

typhoid (tī′foyd) [Gr. *typhos,* fever, + *eidos,* form, shape] Resembling typhus.

typhoidal (tī-foy′dăl) Resembling typhoid.

typhoid fever A severe infectious disease marked by fever and septicemia. The Centers for Disease Control and Prevention (CDC) report 400 cases per year in the U.S., mostly among travelers. An estimated 21 million cases of typhoid fever and 200,000 deaths occur worldwide. SYN: *enteric fever*. SEE: *vaccine, typhoid*.

SYMPTOMS: The disease is marked initially by a fever up to 104° F for about 7 days, followed by a flat, rose-colored, fleeting rash, generalized lymphadenopathy, abdominal pain, anorexia, and extreme exhaustion as the bacteria spread through the bloodstream. About 14 days after the infection begins, internal bleeding usually develops as the result of gastrointestinal ulcers, and this may lead to hypovolemic shock. Damage to the liver and spleen is commonly seen. In approx. 10% of patients, typhoid fever is complicated by osteomyelitis, septic arthritis, or meningitis, which account for the majority of deaths.

ETIOLOGY: Typhoid fever is caused by *Salmonella typhi,* gram-negative bacteria that invade the walls of the ileum and colon and then gain access to the bloodstream. The disease is most commonly transmitted through water or food contaminated by human feces, but it can be spread also by vomitus and oral secretions during the acute stage. Unlike *S. enteritidis,* it lives only in humans. A small percentage of persons become carriers after recovering from infection.

DIFFERENTIAL DIAGNOSIS: Paratyphoid, pneumonia, dysentery, meningitis, smallpox, and appendicitis are among the differential diagnoses. Diagnostic points of value are the presence of rose spots, splenomegaly, leukopenia, the Widal serological test result, blood culture, and examination of feces for the presence of the causative organism. The best means of providing bacterial confirmation is through bone marrow culture. This method is successful even after patients have received antibiotics. SEE: *paratyphoid fever*.

TREATMENT: The disease is treated with ciprofloxacin for 10 days. Dexamethasone is administered a few minutes before antibiotics are given in patients with shock or decreased levels of consciousness. Travelers to developing countries should consider vaccination with typhoid vaccine, which is available in oral and parenteral forms. The vaccinations should be completed at least 1 week before the trip; boosters are required every 2 to 5 years, depending on the type of vaccine. The vaccinations should not be given to patients who are taking mefloquine for malaria prophylaxis. SEE: *Standard and Universal Precautions Appendix.*

PATIENT CARE: Enteric precautions (handwashing, patient handwashing, glove and gown for disposal of feces or fecally contaminated objects) are followed until three consecutive stool cultures at 24-hr intervals are negative. Drugs are administered as prescribed, and the patient is observed for signs and symptoms of complications, such as bacteremia, intestinal bleeding, and bowel perforation. During the acute phase, the temperature is monitored, and prescribed antipyretics are administered; tepid sponge baths are also provided to promote vasodilation without shivering. The incontinent patient is cleansed, and high fluid intake by mouth or IV is encouraged to maintain adequate hydration. Adequate nutrition is maintained. The caregiver explains the importance of follow-up care and examination to ensure that the patient is not a carrier.

SEE: *Standard and Universal Precautions Appendix.*

typholysin (tī-fōl′ĭ-sĭn) [″ + *lysis,* dissolution] A lysin destructive to typhoid bacilli.

typhomalarial (tī″fō-mă-lā′rē-ăl) [″ + It. *malaria,* bad air] Having symptoms of both typhoid and malarial fevers.

typhomania (tī-fō-mā′nē-ă) [″ + *mania,* madness] An old term for febrile delirium experienced in typhoid fever or typhus.

typhous (tī′fŭs) [Gr. *typhos,* fever] Pert. to typhus fever.

typhus (tī′fŭs) [Gr. *typhos,* fever] One of several rickettsial infections transmitted to people by lice, fleas, or mites. The causative microbe invades the lining of blood vessels and smooth muscle cells, causing widespread vasculitis. The most common causes of typhus are *Rickettsia prowazekii, R. typhi, and Orientia tsutsugamushi*. *R. prowazekii* causes the epidemic typhus found in crowded conditions with poor sanitation, such as refugee camps. SEE: *Nursing Diagnoses Appendix.*

SYMPTOMS: The disease may be mild, marked only by a flat rash that spreads out from the trunk and petechiae or by flulike symptoms. In more severe cases, patients have fever, skin necrosis, and gangrene on the tips of the fingers, toes, earlobes, and penis as a result of thrombus formation in blood vessels; focal inflammation and thrombosis in organs throughout the body, including the brain, produce organ-specific signs. Rickettsial infections are diagnosed by identifying the organism through immunofluorescent staining.

TREATMENT: Typhus is treated with doxycycline for 7 days. SEE: *Standard and Universal Precautions Appendix.*

COMPLICATIONS: Bronchopneumonia occurs more frequently than lobar pneumonia. Hypostatic congestion of the lungs, nephritis, and parotid abscess also may occur.

PROGNOSIS: The prognosis is variable. Mortality may be quite high in epidemic typhus and almost nonexistent in murine typhus. Broad-spectrum antibiotics are life-saving if given early enough.

endemic t. Murine t.

epidemic t. An infectious disease caused by *Rickettsia prowazekii* and transmitted by the human body louse *(Pediculus humanus corporis)*.

flea-borne t. Murine t.

Mexican t. A louse-borne epidemic typhus present in certain portions of Mexico.

mite-borne t. Scrub typhus.

murine t. A disease caused by *Rickettsia typhi* and occurring in nature as a mild infection of rats and transmitted from rat to rat by the rat-louse or flea. Humans may acquire it by being bitten by infected rat fleas or ingesting food contaminated by rat urine or flea feces. SYN: *endemic typhus; flea-borne typhus*.

recrudescent t. The recurrence of epidemic typhus after the initial attack.

typical (tĭp′ĭ-kăl) [Gr. *typikos,* pert. to type] Having the characteristics of, pert. to, or conforming to a type, condition, or group.

typing (tīp′ĭng) Identification of type.

bacteriophage t. Determination of the subdivision of a bacterial species using a type-specific bacteriophage.

blood t. The method used to determine the antigens present on a person's blood cells.

tissue t. Technique for determining the histocompatibility of tissues to be used in grafts and transplants with the recipient's tissues and cells. SEE: *transplantation*.

typo- Combining form meaning *type.*

typodont (tī′pō-dŏnt) A replica of the natural dentition and alveolar mucosa used in training dental professionals.

typoscope (tī′pō-skōp) [Gr. *typos,* type, + *skopein,* to examine] A reading aid device for patients with amblyopia or cataract.

typus (tī′pŭs) [L.] Type.

tyramine (tī′ră-mēn) An intermediate product in the conversion of tyrosine to epinephrine. Tyramine is found in most cheeses and in beer, broad bean pods, yeast, wine, and chicken liver.

CAUTION: When persons taking certain monoamine oxidase inhibitors eat these foods, they may experience severe hypertension, headache, palpitation, neck pain, and perhaps intracranial hemorrhage.

tyrannism (tĭr′ăn-ĭzm) [Gr. *tyrannos,* tyrant, + *-ismos,* condition] Sadism.

tyrogenous (tī-rŏj′ĕn-ŭs) [Gr. *tyros,* cheese, + *gennan,* to produce] Having origin in or produced by cheese.

Tyroglyphus (tī-rōg′lĭ-fŭs) [Gr. *tyros,* cheese, + *glyphein,* to carve] A genus of sarcoptoid mites commonly known as cheese mites. They infest cheese and dried vegetable food products and occasionally infest humans, causing pruritus. This genus includes species that cause grocer's itch, vanillism, and copra itch.

tyroid (tī′royd) [″ + *eidos,* form, shape] Caseous; cheesy.

tyromatosis (tī″rō-mă-tō′sĭs) [″ + *oma,* tumor, + *osis,* condition] Caseation (1).

tyrosinase (tī-rō′sĭn-ās) [Gr. *tyros,* cheese] An enzyme that acts on tyrosine to produce melanin. It is used as a tumor marker for malignant melanoma, since almost all melanomas express the enzyme.

tyrosine (tī′rō-sĭn) $C_9H_{11}NO_3$; an amino acid present in many proteins, esp. casein. It serves as a precursor of epinephrine, thyroxine, and melanin. Two vitamins, ascorbic acid and folic acid, are essential for its metabolism.

tyrosinemia (tī″rō-sĭ-nē′mē-ă) A disease of tyrosine metabolism caused by a deficiency of the enzyme tyrosine aminotransferase. In addition to an accumulation of tyrosine in the blood, mental retardation, keratitis, and dermatitis are present. Treatment consists of controlling phenylalanine and tyrosine intake.

tyrosinosis (tī″rō-sĭn-ō′sĭs) [″ + *osis,* condition] A condition resulting from faulty metabolism of tyrosine, whereby its oxidation products appear in the urine.

tyrosinuria (tī″rō-sĭn-ū′rē-ă) [″ + *ouron,* urine] Tyrosine in the urine.

tyrosis (tī-rō′sĭs) [″ + *osis,* condition] **1.** Curdling of milk. **2.** Vomiting of cheesy substance by infants. **3.** Caseation (1).

tyrosyluria (tī″rō-sĭl-ū′rē-ă) Increased tyrosine-derived products in the urine.

tyrotoxism (tī″rō-tŏks′ĭzm) [″ + *toxikon,* a poison, + *-ismos,* condition] Poisoning produced by a milk product or by cheese.

Tyrrell's fascia (tĭr′rĕlz) [Frederick Tyrrell, Brit. anatomist, 1797–1843] An ill-defined fibromuscular layer from the middle aponeurosis of the perineum, behind the prostate gland.

Tyson's gland (tī′sŭnz) [Edward Tyson, Brit. physician and anatomist, 1650–1708] Preputial gland.

tyvelose (tī′vĕl-ōs) A carbohydrate, 3-6-dideoxy-D-mannose, derived from certain strains of *Salmonella* and *Trichinella*.

Tzanck cell A degenerated cell from the keratin layer of the skin, disconnected from adjacent cells. It is seen in pemphigus.

Tzanck test (tsănk) [Arnault Tzanck, Russ. dermatologist in Paris, 1886–1954] The examination of cells scraped from the lower surface of a vesicle to determine the underlying disease (e.g., infection with a herpesvirus).

tzetze (sĕt′sē) Tsetse fly.

U

U **1.** *unit.* **2.** Symbol for the element uranium.

^{235}U Isotope of uranium with mass number 235.

UAO *upper airway obstruction.*

ubiquinol (ū-bĭk′wĭ-nŏl) Coenzyme QH_2, the reduced form of ubiquinone.

ubiquinone (ū-bĭk′wĭ-nōn) [*ubi*quitous + coenzyme *quinone*] Coenzyme Q, a lipid-soluble quinone present in virtually all cells. It collects reducing equivalents during intracellular respiration and is converted to its reduced form, ubiquinol, while involved in this process. This substance is widely used in Europe and Asia as a health food supplement for congestive heart failure and other disorders, although confirmation of its effectiveness is uncertain.

ubiquitin (ū-bĭk′wĭ-tĭn) An intracellular protein that helps to destroy misfolded proteins. It is also important in promoting the functions of proteins that make up ribosomes.

UDP *uridine diphosphate.*

Uhthoff's sign (oot′hŏfs) [Wilhelm Uhthoff, Ger. ophthalmologist, 1853–1927] The nystagmus that occurs in multiple sclerosis.

ulcer (ŭl′sĕr) [L. *ulcus,* ulcer] A lesion of the skin or mucous membranes marked by inflammation, necrosis, and sloughing of damaged tissues. A wide variety of insults may produce ulcers, including trauma, caustic chemicals, intense heat or cold, arterial or venous stasis, cancers, drugs (e.g., nonsteroidal anti-inflammatory drugs), and infectious agents such as *Herpes simplex* or *Helicobacter pylori*.

amputating u. An ulcer that destroys tissue to the bone by encircling the part.

aphthous u. A lesion of the skin or mucous membranes (e.g., of the oral mucosa, conjunctiva, or genitalia). It is usually less than 0.5 cm in diameter. If it persists for longer than 2 weeks, it should be biopsied in order to rule out cancer. SYN: *aphthous stomatitis; canker sore*.

ETIOLOGY: Aphthous ulcers are found in stomatitis, Behçet's syndrome, Crohn's disease, human immunodeficiency syndrome, some cancers, and other diseases.

TREATMENT: For patients with oral ulcers, application of a topical anesthetic or a protective paste provides symptomatic relief and makes it possible to eat without pain.

atonic u. A chronic ulcer with scant tendency to heal.

callous u. A chronic ulcer with indurated, elevated edges and no granulation that heals slowly.

chronic leg u. Any long-standing, slow-to-heal ulcer of a lower extremity, esp. one caused by occlusive disease of the arteries or veins or by varicose veins.

Curling's u. SEE: under *Curling's ulcer*.

Cushing's u. Stress ulcers that occur in patients with increased intracranial pressure. Cushing's ulcers may be caused by increased secretion of gastric acid as the result of vagus nerve stimulation.

denture u. An ulcer of the oral mucosa caused by irritation from wearing dentures.

duodenal u. An open sore on the mucosa of the first portion of the duodenum, most often as the result of infection with *Helicobacter pylori*. It is the most common form of peptic ulcer. SEE: *peptic ulcer*.

follicular u. A tiny ulcer originating in a lymph follicle and affecting a mucous membrane.

fungal u. **1.** An ulcer in which the granulations protrude above the edges of the wound and bleed easily. **2.** An ulcer caused by a fungus.

gastric u. An ulcer of the gastric mucosa.

ETIOLOGY: Common causes are nonsteroidal anti-inflammatory drugs, use of alcohol or tobacco, and infection with *Helicobacter pylori*. SEE: *peptic ulcer*.

Hunner's u. Interstitial cystitis.

indolent u. A nearly painless ulcer usually found on the leg, characterized by an indurated and elevated edge and a nongranulating base.

Meleney's u. SEE: under *Meleney*.

peptic u. SEE: *peptic ulcer*.

perforating u. An ulcer that erodes through an organ, such as the stomach or duodenum.

phagedenic u. Tropical ulcer.

pressure u. Pressure sore.

rodent u. A basal cell carcinoma that has caused extensive local invasion and tissue destruction, esp. on the face. The usual sites are the outer angle of the eye, near the side and on the tip of the nose, and at the hairline. SYN: *Jacob's ulcer*.

serpiginous u. A creeping ulcer that heals in one part and extends to another.

shield u. A corneal ulcer found in

some patients with vernal conjunctivitis. The ulcer is sometimes associated with corneal plaques that may permanently impair vision.

simple u. A local ulcer with no severe inflammation or pain.

specific u. An ulcer caused by a specific disease, such as syphilis or lupus.

stercoral u. **1.** An ulcer caused by pressure from impacted feces. **2.** A perforating ulcer through which feces escape.

stress u. Multiple, small, shallow ulcers that form in the mucosa of the stomach or, occasionally, in the duodenum, in response to extreme physiological stressors. Stress ulcers seen in patients with shock, extensive burns, or sepsis are called Curling's ulcers and may be caused by mucosal ischemia secondary to systemic vasoconstriction. Stress ulcers that occur in patients with increased intracranial pressure (Cushing's ulcers) may be caused by increased secretion of gastric acid as the result of vagus nerve stimulation. SEE: *peptic u.*

traumatic u. An ulcer due to injury of the oral mucosa. Causes include biting, denture irritation, toothbrush injury, and sharp edges of teeth or restorations.

trophic u. An ulcer caused by the failure to supply nutrients to a part.

tropical u. **1.** An indolent ulcer, usually of a lower extremity, that occurs in persons living in hot, humid areas. The etiology may or may not be known, and it may be caused by a combination of bacterial, environmental, and nutritional factors. SYN: *phagedenic ulcer*. **2.** The tropical sore caused by leishmaniasis.

varicose u. An ulcer, esp. of the lower extremity, associated with varicose veins.

venereal u. An ulcer caused by a sexually transmitted disease (i.e., chancre or chancroid).

venous stasis u. A poorly and slowly healing ulcer, usually located on the lower extremity above the medial malleolus. It typically is edematous, pigmented, and scarred. The skin is extremely fragile and easily injured. SEE: illus.

VENOUS STASIS ULCER
On leg

ulcera (ŭl′sĕr-ă) Pl. of ulcus.

ulcerate (ŭl′sĕr-āt) [L. *ulcerare,* to form ulcers] To produce or become affected with an ulcer.

ulcerated (ŭl′sĕr-ā″tĕd) Of the nature of an ulcer or affected with one.

ulceration (ŭl″sĕr-ā′shŭn) A suppurative or non-healing lesion on a surface such as skin, cornea, or mucous membrane.

ulcerative (ŭl′sĕr-ā-tĭv) [L. *ulcerare,* to form ulcers] Pert. to or causing ulceration.

ulcerogangrenous (ŭl″sĕr-ō-găng′grĕ-nŭs) Rel. to an ulcer that contains gangrenous tissue.

ulceromembranous (ŭl″sĕr-ō-mĕm′brăn-ŭs) [″ + *membrana,* membrane] Pert. to ulceration and formation of a fibrous pseudomembrane.

ulcerous (ŭl′sĕr-ŭs) Pert. to or affected with an ulcer.

ulcus (ŭl′kŭs) *pl.* **ulcera** [L.] Ulcer.

ulegyria (ū″lē-jī′rē-ă) [Gr. *oule,* scar, + *gyros,* ring] A condition in which gyri of the cerebral cortex are abnormal due to scar tissue from injuries, usually occurring in early development.

ulerythema (ū-lĕr-ĭ-thē′mă) [″ + *erythema,* redness] An erythematous disorder with atrophic scar formation.

u. ophryogenes Folliculitis of the eyebrows, characterized by loss of hair and scarring.

ulitis (ū-lī′tĭs) Gingivitis.

ulna (ŭl′nă) [L., elbow] The larger bone of the forearm, between the wrist and the elbow, on the side opposite that of the thumb. It articulates with the head of the radius and humerus proximally, and with the radius and carpals distally.

ulnad (ŭl′năd) [″ + *ad,* to] In the direction of the ulna.

ulnar (ŭl′năr) [L. *ulna,* elbow] Rel. to the ulna, or to the nerve or artery named from it.

ulnar drift A joint abnormality at the metacarpophalangeal joints, frequently seen in rheumatoid arthritis, resulting from chronic synovitis. In this condition, the long axis of the fingers deviates in an ulnar direction with respect to the metacarpals.

ulnaris (ŭl-nā′rĭs) **1.** Ulnar. **2.** Concerning the ulna.

ulnocarpal (ŭl″nō-kăr′păl) [″ + Gr. *karpos,* wrist] Relating to the carpus and ulna, or to the ulnar side of the wrist.

ulnoradial (ŭl″nō-rā′dē-ăl) [″ + *radius,* spoke of a wheel] Rel. to the ulna and radius, as their ligaments and articulations.

ultimate (ŭl′tĭm-ĭt) [L. *ultimus,* last] Final or last.

ultimobranchial body (ŭl″tĭ-mō-brăng′kē-ăl) One of two embryonic pharyngeal pouches usually considered as rudimentary fifth pouches. They become separated from the pharynx and incorporated into the thyroid gland, where they give rise to parafollicular cells that secrete calcitonin, a hormone that lowers the blood calcium level.

ultra- [L.] Prefix meaning *beyond, excess.*

ultrabrachycephalic (ŭl″tră-brăk″ĭ-sĕ-făl′ĭk) [L. *ultra,* beyond, + Gr. *brachys,* short, + *kephale,* head] Having a cephalic index of 90 or more.

ultracentrifugation (ŭl″tră-sĕn-trĭf″ū-gā′shŭn) Treatment or preparation of substances by use of the ultracentrifuge. *Analytical* ultracentrifugation is a means of determining molecular mass, structure, and size. *Preparative* ultracentrifugation is a means of purifying mixed solutions of proteins. It separates them based on their densities or their sedimentation coeffieients.

ultracentrifuge (ŭl-tră-sĕn′trĭ-fūj) [″ + *centrum,* center, + *fugere,* to flee] A high-speed centrifuge capable of producing centrifugal forces more than 100,000 times gravity; it is used in the study of proteins, viruses, and other substances present in body fluids.

ultradian (ŭl-trā′dē-ăn) [″ + *dies,* day] Concerning biological rhythms that occur less frequently than every 24 hr.

ultrafilter (ŭl-tră-fĭl′tĕr) A filter by which colloidal particles may be separated from their dispersion medium or from crystalloids.

ultrafiltration (ŭl″tră-fĭl-trā′shŭn) [″ + *filtrum,* a filter] Filtration of a colloidal substance in which the dispersed particles, but not the liquid, are held back.

Ultram Tramadol.

ultramicroscopy (ŭl″tră-mī-krŏs′kō-pē) The use of the ultramicroscope.

ultramicrotome (ŭl″tră-mī′krō-tōm) A microtome that makes extremely thin slices of tissue.

ultrarapid (ŭl″tră-răʹpĭd) [L. *ultra-,* beyond, + *rapidus,* seizing, rapid] Exceptionally fast; said of, e.g., centrifuges, some chemical reactions, and some forms of tissue fixation or freezing.

ultrasonic (ŭl-tră-sŏn′ĭk) [″ + *sonus,* sound] Pert. to sounds of frequencies above approx. 20,000 cycles/sec, which are inaudible to the human ear. SEE: *supersonic; ultrasonography; ultrasound*.

ultrasonic cleaning The use of ultrasonic energy to sterilize objects, including medical and surgical instruments.

ultrasonics (ŭl-tră-sŏn′ĭks) The division of acoustics that studies inaudible sounds (i.e., those with frequencies greater than 20,000 cycles/sec). Biological effects may result, depending on the intensity of the beams. Heating effects are produced by beams of low intensity, paralytic effects by those of moderate intensity, and lethal effects by those of high intensity. The lethal action of ultrasonics is primarily the result, either directly or indirectly, of cavitation of tissues. Ultrasonics is used clinically for therapeutic and diagnostic purposes. In dentistry, instruments producing 29,000 cycles/sec are used in periodontal surgery, curettage, and root planing. SEE: *ultrasound*.

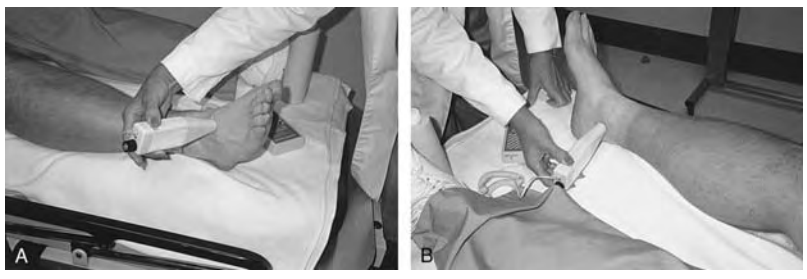
ultrasonogram (ŭl″tră-sŏn′ō-grăm) The image produced by use of ultrasonography.

ultrasonography (ŭl-tră-sŏn-ŏg′ră-fē) The use of ultrasound to produce an image or photograph of an organ or tissue. Ultrasonic echoes are recorded as they return from reflecting or refracting tissues of different densities.

arterial duplex u. A diagnostic procedure that helps to identify areas within arteries where blood flow is blocked or reduced. SEE: *LEAS*.

Doppler u. The shift in frequency produced when an ultrasound wave is echoed from something in motion. The use of the Doppler effect permits measuring the velocity of that which is being studied (e.g., blood flow in a vessel). SEE: illus.

gray-scale u. Use of a television scan technique to process the strength of ul-



DOPPLER ULTRASONOGRAPHY
Doppler probe used on (A) dorsal pedis and (B) posterior tibial arteries

trasound echoes with the strongest being registered as white and the weakest as different shades of gray.

pelvic u. Ultrasonographic visualization of the uterus, fallopian tubes, endometrium, and, in pregnant patients, the fetus. The test may be used to diagnose ectopic pregnancy, determine multiple pregnancies, identify ovarian cysts and pelvic cancers, and visualize tubo-ovarian abscesses. To obtain the needed images, the transducer (ultrasound probe) can be placed either on the abdominal wall or within the vagina.

ultrasound (ŭl′tră-sownd″) Inaudible sound in the frequency range of approx. 20,000 to 10 billion (10^9) cycles/sec. Ultrasound has different velocities that differ in density and elasticity from one kind of tissue to the next. This property permits the use of ultrasound in outlining the shape of various tissues and organs in the body. In obstetrics, for example, identifying the size and position of the fetus, placenta, and umbilical cord enables estimation of gestational age, detects some fetal anomalies and fetal death, and facilitates other diagnostic procedures, such as amniocentesis. In physical therapy, the thermal effects of ultrasound are used to treat musculoskeletal injuries by warming tissue, increasing tissue extensibility, and improving local blood flow. Ultrasound is used to facilitate movement of certain medications (e.g., pain relievers) into tissue (phonophoresis). Ultrasound is also used with electric current for muscular stimulation. The diagnostic and therapeutic uses of ultrasound require special equipment. SEE: *phonophoresis; sonographer; ultrasonography*.

A-mode u. Sonographic information presented as a single line representing the time it takes for the ultrasound wave to reach the interface of a structure and reflect back to the transducer. SYN: *A-mode*.

B-mode u. Brightness mode display: in ultrasonography, the use of dots of differing intensities to represent echoes received from tissues that more strongly or weakly reflect sound waves. SYN: *B-mode (brightness mode) display*.

continuous wave Doppler u. A Doppler ultrasound that uses two transducers: one that transmits an uninterrupted series of sound waves and another that constantly receives echoes from the tissues being examined. It is used, e.g., to study obstruction to blood flow through vessels.

duplex Doppler u. A Doppler ultrasound that uses a transducer with two functions: pulsed-wave Doppler and B-mode imaging.

endobronchial u. ABBR: EBUS. The use of ultrasonic transducers carried within a bronchoscope to evaluate tissues in or adjacent to the trachea and bronchi. EBUS can be used to identify solid masses to be biopsied. It helps distinguish solid masses, which may be malignant, from blood vessels such as the aorta or pulmonary arteries, which should not be penetrated with a biopsy needle.

endovaginal u. Pelvic ultrasound.

intravascular u. In ultrasonography, a technique for imaging intimal tissue proliferation and blood vessel blockages.

M-mode u. Motion mode display: an ultrasonic display mode in which the motion of structures is seen on the vertical axis of the display, used, e.g., to show the movement of the heart's valves and walls during diastole and systole. SYN: *time-motion mode ultrasound; M-mode ultrasound*.

pelvic u. Examination of the pelvis with an ultrasonic transducer placed inside the vagina. It is used in assessment of diseases or conditions affecting the cervix, uterus, fallopian tubes, or ovaries.

pulsed-wave Doppler u., pulsed Doppler u. SEE: *transducer, pulse-echo*.

quantitative u. ABBR: QUS. Measurement of the density of a body tissue (e.g., bone) by determining how rapidly sound travels through the tissue and how different sonic wavelengths are absorbed. QUS is used to diagnose osteopenia and osteoporosis.

real-time u. A sonographic procedure that provides rapid, multiple images of an anatomical structure in the form of motion.

time-motion mode u. M-mode ultrasound.

ultrastructure (ŭl′tră-strŭk″chŭr) The fine structure of tissues. It is visible only by use of electron microscopy.

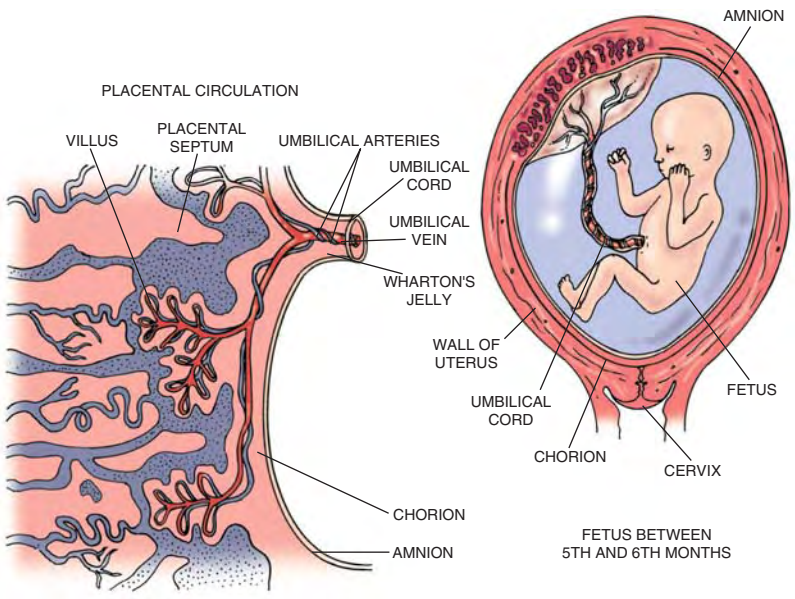
ultraviolet (ŭl″tră-vī′ō-lĕt) [″ + *viola,* violet] Beyond the visible spectrum at its violet end, said of rays between the violet rays and x-rays. SEE: *infrared ray*.

ultraviolet therapy Treatment with ultraviolet radiation. SEE: *heliotherapy; phototherapy*.

ululation (ŭl″ū-lā′shŭn) [L. *ululare,* to howl] Howling; wailing.

umbilical (ŭm-bĭl′ĭ-kăl) [L. *umbilicus,* navel] Pert. to the umbilicus.

umbilical cord The attachment connecting the fetus with the placenta. It contains two arteries and one vein surrounded by a gelatinous substance, Wharton's jelly. The umbilical arteries carry blood from the fetus to the placenta, where nutrients are obtained and carbon dioxide and oxygen are exchanged; this oxygenated blood returns



UMBILICAL CORD

to the fetus through the umbilical vein. SEE: illus.

The umbilical cord is surgically severed after the birth of the child. To give the infant a better blood supply, the cord should not be cut or tied until the umbilical vessels have ceased pulsating. However, in preterm infants, the cord should be clamped and cut before pulsation ceases to avoid maternal-newborn transfusion and reduce the risk of hypovolemia, polycythemia, and hyperbilirubinemia.

The stump of the severed cord atrophies and leaves a depression on the abdomen of the child, called a navel or umbilicus.

umbilical souffle A hissing sound said to arise from the umbilical cord.

umbilical vesicle SEE: under *vesicle*.

umbilicate (ŭm-bĭl′ĭ-kāt) [L. *umbilicatus,* dimpled] Dimpled, pitted, or shaped like a navel. Said of the appearance of certain rashes, such as molluscum contagiosum. **umbilicated,** *adj.*

umbilication (ŭm-bĭl-ĭ-kā′shŭn) [L. *umbilicatus,* dimpled] **1.** A depression resembling a navel. **2.** Formation at the apex of a pustule or vesicle of a pit or depression.

umbilicus (ŭm-bĭ-lī′kŭs, -bĭl′ĭ-kŭs) *pl.* **umbilici** [L., a pit] A depressed point in the middle of the abdomen; the scar that marks the former attachment of the umbilical cord to the fetus. SEE: *Cullen's sign; nodule, Sister Mary Joseph; Tanyoz's sign*.

umbo (ŭm′bō) [L., boss of a shield] The projecting center of a round surface.

u. of tympanic membrane The central depressed portion of the concavity on the lateral surface of the tympanic membrane. It marks the point where the malleus is attached to the inner surface.

umbra (ŭm′bră) [L., shade, shadow] The edge of the radiographic image proper.

umbrella filter SEE: under *filter*.

UMP *uridine monophosphate.*

un- [AS.] Prefix meaning *back, reversal, annulment, not.*

uncal (ŭng′kăl) Concerning the uncus of the brain.

uncal herniation Transtentorial herniation.

Uncaria tomentosa (ŭn-kă′rē-ă tō-mĕn-tō′să) A medicinal plant, known popularly as cat's claw or *uña de gato*. Its extracts include alkaloids that are used as an anti-inflammatory for arthritis and also have effects on thinking, concentration, and sedation.

unciform, unciforme (ŭn′sĭ-form) [L. *uncus,* hook, + *forma,* shape] Uncinate.

unciform fasciculus SEE: under *fasciculus*.

uncinariasis (ŭn″sĭn-ă-rī′ă-sĭs) The condition of being infested with hookworms (i.e., worms of the genus *Uncinaria*).

uncinate (ŭn′sĭn-āt) [L. *uncinatus,* hooked] Hook-shaped; hooked. SYN: *unciform*.

uncinate bundle of Russell [James S. Risien Russell, Brit. physician, 1863–1939] Fibers that arise in the fastigial

superior cerebellar peduncle and pass inferiorly to the vestibular nuclei and reticular formation by which impulses are carried to muscles, esp. those of the neck and body.

uncinate epilepsy An old term for "temporal lobe epilepsy," arising from a focus in the uncinate area of the temporal lobe of the brain.

uncinate fasciculus Unciform fasciculus.

uncinate seizure A seizure marked by olfactory and gustatory hallucinations, usually disagreeable; a sense of unreality; and sometimes convulsions and temporary loss of senses of taste and smell. This is associated with lesions of the uncinate gyrus of the temporal lobe of the brain.

uncinatum (ŭn″sĭ-nā′tŭm) [L.] Hooked.

uncipressure (ŭn′sĭ-prĕsh″ŭr) [L. *uncus,* hook, + *pressura,* pressure] Pressure applied with the use of a blunt hook to arrest bleeding.

uncombable hair syndrome A rare disorder, typically identified in childhood, in which hair grows in unruly bundles, sometimes called a "spun glass arrangement." The hair is dry, shiny or blond, and easily broken. Cross-sectioning often reveals a triangular or grooved shaft. The condition is often associated with other birth defects. SYN: *spun glass hair syndrome*. SEE: *pili trianguli et canaliculi*.

uncomplemented (ŭn-kŏm′plē-mĕnt″ĕd) Not joined or associated with complement and thus inactive.

unconscious (ŭn-kŏn′shŭs) [AS. *un,* not, + L. *conscius,* aware] **1.** Insensible; lacking in awareness of the environment. SEE: *unconsciousness*. **2.** In Freudian psychiatry, that part of our personality consisting of a complex of feelings and drives of which we are unaware and that are not available to our consciousness.

collective u. One of two divisions of the unconscious, according to the unproven hypotheses of Carl Jung, the other category being personal unconscious. The personal unconscious includes all of the material stored in the unconscious that was acquired through personal experience. The collective unconscious comprises material that the species inherits. Thus, the collective unconscious would be common to all members of a society, a people, or to humankind in general. Instinct is included in the collective unconscious. SEE: *sociobiology*.

unconsciousness (ŭn-kŏn′shŭs-nĕs) [AS. *un,* not, + L. *conscius,* aware] The state of being partly or completely unaware of external stimuli. Unconsciousness occurs normally in sleep, and pathologically, in such conditions as syncope (fainting), shock, unperfused cardiac dysrhythmias, and intoxications. SEE: *coma; Glasgow Coma Scale; Nursing Diagnoses Appendix.*

uncontrolled area For radiation protection purposes, an area occupied by the general public.

unco-ossified (ŭn″kō-ŏs′ĭ-fīd) Not ossified into one bone.

uncovertebral (ŭn″kō-vĕr′tĕ-brăl) Concerning the uncinate process of a vertebra.

unction (ŭnk′shŭn) [L. *unctio,* ointment] **1.** The application of an ointment. **2.** Ointment.

uncus (ŭn′kŭs) [L. *uncus,* hook] **1.** Any structure that is hook-shaped. **2.** Uncinate convolution.

undecylenic acid An antifungal drug used topically to treat tinea pedis.

underachiever A person whose achievements are less than what is predicted to be possible, based on his or her aptitudes, intelligence, and socioeconomic status.

underbite (ŭn′dĕr-bīt′) A condition in which the lower incisors pass in front of the upper incisors when the mouth is closed.

undercut (ŭn′dĕr-kŭt) A condition of having overhanging tissue as could be the case in preparing a dental cavity for restoration. Undercutting helps to keep the filling material in place.

undernutrition (ŭn″dĕr-nū-trĭsh′ŭn) [AS. *under,* beneath, + LL. *nutritio,* nourish] Inadequate nutrition from any cause.

SYMPTOMS: This condition is marked by loss of body weight that begins with loss of glycogen, loss of body fat, and then proceeds to loss of protein. Vitamin, mineral, and micronutrient deficiencies are also usually present. SEE: *malnutrition*.

The term undernutrition is also used to indicate reduced caloric consumption while maintaining adequate intake of all micronutrients.

undertoe (ŭn′dĕr-tō) [″ + *ta,* toe] The displacement of the great toe underneath the others.

underweight (ŭn′dĕr-wāt″) Body weight for height that is 15% to 20% below healthy weight; a body mass index below 19. By this standard, which is the one promoted both by the World Health Organization and the National Heart, Lung, and Blood Institute, a person who stands 5'7" tall is underweight if he or she weighs less than 120 lb.

undifferentiation (ŭn-dĭf″ĕr-ĕn-shē-ā′shŭn) [AS. *un,* not, + L. *differens,* bearing apart] An alteration in cell character to a more embryonic type or toward a malignant state. SYN: *anaplasia*.

undulant (ŭn′dū-lănt) [L. *undulatio,* wavy] Rising and falling like waves, or moving like them.

undulant fever (ŭn′dū-lănt) Brucellosis.

undulate (ŭn′dū-lāt) [L. *undulatio,* wavy] Wavy; having a wavy border with shallow sinuses, said of bacterial colonies.
undulation (ŭn-dū-lā′shŭn) A continuous wavelike motion or pulsation.
ung [L.] *unguentum,* ointment.
ungu-, unguo- Combining forms meaning *nail*.
ungual (ŭng′gwăl) [L. *unguis,* nail] Pert. to or resembling the nails.
ungual tuberosity The spatula-shaped extremity of the terminal phalanx that supports the nails of fingers and toes.
unguent, unguentum (ŭng′gwĕnt) [L. *unguentum,* ointment] Ointment.
unguis (ŭng′gwĭs) *pl.* **ungues** [L., nail] **1.** A fingernail or toenail. SYN: *onyx*. **2.** The lacrimal bone. **3.** A white prominence on the floor of the posterior horn of the lateral ventricle. SYN: *hippocampus minor*.
u. incarnatus An ingrowing nail, esp. a toenail.
uni- Combining form meaning *one.* SEE: *mono-*.
uniarticular (ū″nē-ăr-tĭk′ū-lăr) [L. *unus,* one, + *articulus,* joint] Pert. to a single joint.
uniaxial (ū″nē-ăk′sē-ăl) [″ + *axis,* axis] Having a single axis.
unibasal (ū″nē-bā′săl) [″ + *basis,* base] Having a single base.
unicameral (ū″nĭ-kăm′ĕr-ăl) [″ + *camera,* vault] Having a single cavity.
unicellular (ū″nĭ-sĕl′ū-lăr) [″ + *cellula,* a little box] Having only one cell.
unicentral (ū″nĭ-sĕn′trăl) [″ + *centrum,* center] Having a single center.
uniceps (ū′nĭ-sĕps) [″ + *caput,* head] Having a single head or origin, as in muscles.
unicorn, unicornous (ū′nĭ-korn, ū-nĭ-kor′nŭs) [″ + *cornu,* horn] Having a single cornu or horn. Women with a unicornous uterus are at higher risk for repeated pregnancy loss.
unicuspid (ū″nĭ-kŭs′pĭd) Having a single cusp.
uniform Having the identical shape or form of other objects of the same class.
unigerminal (ū″nĭ-jĕr′mĭ-năl) Concerning a single ovum or germ.
uniglandular (ū″nĭ-glăn′dū-lăr) Concerning one gland.
unigravida (ū″nĭ-grăv′ĭ-dă) [″ + *gravida,* pregnant] A woman who is pregnant for the first time. SEE: *primigravida*.
unilaminar (ū″nĭ-lăm′ĭ-năr) Having a single layer.
unilateral (ū″nĭ-lăt′ĕr-ăl) [″ + *latus,* side] Affecting or occurring on only one side. SEE: *contralateral; homolateral; ipsilateral*.
unilateral neglect The state in which an individual is perceptually unaware of and inattentive to one side of the body and the immediate unilateral area that the patient visualizes. SEE: *Nursing Diagnoses Appendix.*
unilobar (ū″nĭ-lō′băr) Having a single lobe.
unilocular (ū″nĭ-lŏk′ū-lăr) [″ + *loculus,* a small space] Having only one cavity.
uninuclear (ū″nĭ-nū′klē-ăr) [″ + *nucleus,* a kernel] Having only one nucleus.
uninucleated (ū″nĭ-nū′klē-āt″ĕd) Having a single nucleus.
uniocular (ū″nē-ŏk′ū-lăr) [″ + *oculus,* eye] Pert. to or having only one eye.
union (ūn′yŭn) [L. *unio*] **1.** The act of joining two or more things into one part, or the state of being so united. **2.** Growing together of severed or broken parts, as of bones or the edges of a wound. SEE: *healing*.
secondary u. **1.** A healing by second intention with adhesion of granulating surfaces. SEE: *healing*. **2.** Operative correction of nonunion of a fracture.
vicious u. The union of the ends of a broken bone formed in such a way as to cause deformity.
unioval (ū″nē-ō′văl) [L. *unus,* one, + *ovum,* egg] Developed from one ovum, as identical twins.
uniovular (ū″nē-ŏv′ū-lăr) [″ + *ovum,* egg] Monozygotic, as in the case of twins that develop from a single ovum.
unipara (ū-nĭp′ă-ră) [″ + *parere,* to bring forth, to bear] A woman who has had one pregnancy of more than 20 weeks' duration or has produced a fetus weighing at least 500 g, regardless of the fetus's viability. SEE: *primipara*.
uniparous (ū-nĭp′ă-rŭs) [″ + *parere,* to bring forth, to bear] **1.** Giving birth to one offspring at a time. **2.** Having produced one child weighing at least 500 g or having a pregnancy lasting 20 weeks, regardless of the fetus's viability.
unipolar (ū″nĭ-pō′lăr) [″ + *polus,* pole] **1.** Having or pert. to one pole. **2.** Having a single process, as a unipolar neuron.
unipotent, unipotential (ū-nĭp′ō-tĕnt, ū″nĭ-pō-tĕn′shăl) In cell biology, committed to a single, differentiated structure and a single mode of functioning.
uniseptate (ū″nē-sĕp′tāt) Having only one septum.
unisex (ū′nĭ-sĕks″) **1.** Lack of gender distinction by external appearance, esp. with respect to hairstyle or clothing. **2.** Suitable for use by either sex.
unit (ū′nĭt) [L. *unus,* one] ABBR: u. **1.** One of anything. **2.** A determined amount adopted as a standard of measurement. Particular units are listed under the first word. SEE: e.g., *British thermal unit; dental unit; SI units*.
unitarian (ū-nĭ-tār′ē-ăn) [L. *unitarius*] Composed of a single unit.
unitary (ū′nĭ-tĕr-ē) Rel. to a single unit.
unit of capacity The capacity of a condenser that gives a difference of poten-

tial of 1 volt when charged with 1 coulomb. SYN: *curie; farad*.

United Network for Organ Sharing ABBR: UNOS. An organization established in 1984 to facilitate donation of organs for possible transplantation. Website: www.unos.org. SEE: *organ donation*.

United States Adopted Names ABBR: USAN. Dictionary of nonproprietary names, brand names, code designations, and Chemical Abstracts Service registry numbers for drugs published by the U.S. Pharmacopeial Convention, Inc. The purpose is to have nonproprietary names assigned to new drugs in accordance with established principles. SEE: *USAN and the USP Dictionary of Drug Names*.

United States Pharmacopeia A pharmacopeia issued every 5 years, but with periodic supplements, prepared under the supervision of a national committee of pharmacists, pharmacologists, physicians, chemists, biologists, and other scientific and allied personnel. The U.S. Pharmacopeia was adopted as standard in 1906. Beginning with the U.S. Pharmacopeia XIX, 1975, the National Formulary has been included in that publication.

United States Public Health Service ABBR: USPHS. An agency of the U.S. Department of Health and Human Services (HHS). Its function is to assess health care needs and promote national and international health. Included in the organization are the Centers for Disease Control and Prevention (CDC); Food and Drug Administration (FDA); Alcohol, Drug Abuse and Mental Health Administration; Agency for Toxic Substances and Disease Registry; and various USPHS regional offices.

uniterminal (ū″nĭ-tĕr′mĭn-ăl) [L. *unus,* one, + *terminus,* end] Having only one terminal.

univalence (ū″nĭ-vā′lĕns) The condition of having only one valence.

univalent (ū″nĭ-vā′lĕnt, ū-nĭv′ă-lĕnt) [″ + *valens,* to be powerful] Possessing the power of combining or replacing one atom of hydrogen. SYN: *monovalent*.

universal (ū″nĭ-vĕr′săl) [L. *universalis,* combined into one whole] General or applicable or common to all situations or conditions.

universal cuff A device fitted around the palm of the hand to permit attachment of self-care tools when normal grasp is absent. SYN: *palmar cuff*.

universal design The planning and arrangement of buildings and environments to accommodate accessibility and use by persons with functional limitations.

universal precautions Guidelines designed to protect workers with occupational exposure to bloodborne pathogens (such as HIV and hepatitis B virus). These "universal blood and body fluid precautions" (e.g., gloves, masks, and gowns), originally recommended by the Centers for Disease Control and Prevention in 1985, were mandated by the OSHA Bloodborne Pathogens Standard in 1991 for workers in all U.S. health care settings. SEE: *Standard and Universal Precautions Appendix*.

universal recipient A person belonging to blood type AB, Rh positive, whose serum will not agglutinate the cells of the other ABO blood types. Nevertheless, the recipient's blood must be tested by cross-matching before the transfusion.

unlicensed assistive personnel Persons who assist the licensed nurse in providing care to patients (formerly called nurse's aides or nursing attendants).

unmedullated (ŭn-mĕd′ū-lāt″ĕd) Unmyelinated.

unmyelinated (ŭn-mī′ĕ-lĭ-nāt″ĕd) Lacking a myelin sheath; used of neurons. SYN: *unmedullated*.

Unna's paste (oo′năz) [Paul G. Unna, Ger. dermatologist, 1850–1929] A mixture of 15% zinc oxide in a glycogelatin base.

Unna's (paste) boot A bootlike dressing of the lower extremity made of layers of gauze and Unna's paste. It is used in treating chronic ulcers of the leg. SEE: illus.

UNNA'S BOOT
Boot uncovered on right leg; covered with cohesive bandage on left leg

unorthodox **1.** Unconventional. Not in conformity with generally accepted standards of care. **2.** Bizarre. Unscientific. Irrational.

UNOS *United Network for Organ Sharing*.

unsaturated (ŭn-săt′ū-rāt″ĕd) [AS. *un,* not, + L. *saturare,* to fill] **1.** Capable of dissolving or absorbing to a greater degree. **2.** Not combined to the greatest possible extent.

unsaturated compound An organic compound having double or triple bonds between the carbon atoms.

unsex (ŭn-sĕks′) [″ + L. *sexus,* sex] **1.** To castrate; to spay or excise the ovaries or testes. **2.** To deprive of sexual character.

unstriated (ŭn-strī′āt-ĕd) [″ + *striatus,* striped] Unstriped, as smooth muscle fiber.

Unverricht's disease, Unverricht's syndrome (oon′fĕr-ĭkts) [Heinrich Unverricht, Ger. physician, 1853–1912] A rare, fatal disease inherited as an autosomal recessive trait. It is characterized by the onset in later childhood of progressive myoclonic epilepsy, tetraplegia, and dementia. Also called *Unverricht-Lafora disease.*

up and go test A timed test of lower-extremity mobility. It measures the time required to rise from a chair, walk 10 ft, turn, and return to the sitting position. Performance on this test is affected by abnormal gaits that increase the risk of falling.

upcode (ŭp′kōd″) To assign a higher billing code to a patient visit than is justified by common practice or law.

upper airway obstruction ABBR: UAO. Any potentially life-threatening abnormality in which the flow of air into and out of the lungs is partially or completely blocked by such conditions as laryngeal swelling, foreign bodies, or angioedema. SEE: *cardiopulmonary resuscitation; tracheostomy*.

upper airway resistance syndrome ABBR: UARS. A type of sleep-disordered breathing, caused by increased airflow obstruction, in which a person awakens multiple times and then suffers daytime drowsiness or fatigue.

upper GI *upper gastrointestinal.*

upper motor neuron lesion Neurological damage to the corticospinal or pyramidal tract in the brain or spinal cord. This lesion results in hemiplegia, paraplegia, or quadriplegia, depending on its location and extent. Clinical signs include loss of voluntary movement, spasticity, sensory loss, and pathological reflexes.

upper respiratory infection ABBR: URI. An imprecise term for almost any kind of infectious disease process involving the nasal passages, pharynx, and bronchi. The etiological agent may be bacterial or viral.

upregulate (ŭp-rĕg′yŭ-lāt) **1.** To increase the responsiveness of a cell or organ to a stimulus. **2.** To increase the number of receptors on a cell membrane.

upsiloid (ŭp′sĭ-loyd) [Gr. *upsilon,* letter U, + *eidos,* form, shape] Shaped like the letter U or V.

uptake (ŭp′tāk) The absorption of nutrients, chemicals (including radioactive materials), and medicines by tissues or by an entire organism.

urachal (ū′ră-kăl) [Gr. *ourachos,* fetal urinary canal] Rel. to the urachus.

urachus (ū′ră-kŭs) [Gr. *ourachos,* fetal urinary canal] An epithelioid cord surrounded by fibrous tissue extending from the apex of the bladder to the umbilicus. In the embryo, it is continuous with the allantoic stalk; postnatally it forms the middle umbilical ligament of the bladder.

patent u. A condition in which the urachus remains as a hollow tube that connects the vertex of the bladder with the umbilicus, resulting in an umbilical urinary fistula.

uracil (ū′ră-sĭl) $C_4H_4N_2O_2$; a pyrimidine base found in RNA (not DNA) which, if paired, pairs with adenine.

uracil mustard Nitrogen mustard.

uranium (ū-rā′nē-ŭm) [LL., planet Uranus] SYMB: U. A radioactive element, the parent of radium and other radioelements; atomic weight, 238.029; atomic number, 92. Uranium ore contains the isotopes ^{238}U, ^{235}U, and ^{234}U.

depleted u. The metal remaining after the most active radioisotope (^{235}U) has been extracted from uranium. A heavy metal, depleted uranium is used in munitions, e.g., in armor-piercing weapons. Its radioactivity is about 40 percent that of natural uranium. SEE: *enriched u.*

enriched u. Uranium with a higher concentration of the radioisotope ^{235}U than is found in natural uranium ore. The isotope ^{235}U is used in the manufacture of nuclear weapons. SEE: *depleted u.*

uranoplegia (ū″ră-nō-plē′jē-ă) [″ + *plege,* stroke] Paralysis of muscles of the soft palate.

uranyl (ū′ră-nĭl) The bivalent uranium radical UO^{2+}. It forms salts with many acids. An example is uranyl nitrate, $UO_2(NO_3)_2$.

urase (ū′rās) Urease.

urate (ū′rāt) [Gr. *ouron,* urine] The combination of uric acid with a base; a salt of uric acid.

uratemia (ū″ră-tē′mē-ă) [″ + *haima,* blood] Excessive amounts of urates, esp. sodium urate, in the blood.

uratosis (ū″ră-tō′sĭs) Any condition leading to deposition of urates in tissues.

uraturia (ū″ră-tū′rē-ă) [Gr. *ouron,* urine] Excess of urates in the urine. Uraturia is seen in some individuals with gout or renal failure. SYN: *lithuria*.

urceiform (ŭr-sē′ĭ-form) [L. *urceus,* pitcher, + *forma,* shape] Pitcher-shaped.

urea (ū-rē′ă) [Gr. *ouron,* urine] The diamide of carbonic acid, a crystalline solid having the formula CH_4N_2O; found in blood, lymph, and urine.

It is formed in the liver from ammonia derived from the deamination of amino acids.

Urea is the chief nitrogenous constituent of urine and, along with carbon di-

oxide, the final product of protein metabolism in the body. In normal conditions, urea represents 80% to 90% of the total urinary nitrogen. It is odorless and colorless, appears as white prismatic crystals, and forms salts with acids. The amount of urea excreted varies directly with the amount of protein in the diet. Its excretion is increased in fever, diabetes, or increased activity of the adrenal gland, and decreased in kidney failure.

urea balance test A test of kidney function by measuring intake and output of urea.

urea cycle The complex cyclic chemical reactions in some (ureotelic) animals, including humans, that produce urea from the metabolism of nitrogen-containing foods. This cycle provides a method of excreting the nitrogen produced by the metabolism of amino acids as urea. The cycle was first described by Sir Hans Krebs [1900–1981].

u.c. disorder ABBR: UCD. One of six inherited disorders in which an enzyme in the urea cycle is missing or nonfunctional, resulting in the accumulation of excess ammonia in the bloodstream. Lethargy, failure to thrive, nausea and vomiting, encephalopathy, and coma are common symptoms, esp. in the newborn period.

urea frost White flaky deposits of urea seen on the skin in patients with advanced uremia.

ureagenetic (ū-rē″ă-jĕn-ĕt′ĭk) [″ + *genesis,* generation, birth] Pert. to or producing urea.

ureametry (ū-rē-ăm′ĕt-rē) Determination of the amount of urea in urine.

urea nitrogen The nitrogen of urea (as distinguished from nitrogen in blood proteins).

Ureaplasma urealyticum (ū-rē″ă-plăs′mă) A mycoplasma that is usually sexually transmitted. It may cause inflammation of the reproductive or urinary tracts in males and females. It has been implicated in a wide variety of infections in babies with low birth weight.

urea-reduction ratio The relative decrease (or clearance) of blood urea nitrogen during hemodialysis. The ratio is a measure of the adequacy of renal replacement. The failure to achieve an adequate ratio leads to increased morbidity and mortality among renal failure patients.

urease (ū′rē-ās) [Gr. *ouron,* urine] **1.** An enzyme that accelerates the hydrolysis of urea into carbon dioxide and ammonia. It is used in determining the amount of urea in blood or in urine. **2.** An enzyme used by certain microorganisms to facilitate their existence in otherwise inhospitable body locations.

urelcosis (ū-rĕl-kō′sĭs) [″ + *helkosis,* ulceration] Ulceration of the urinary tract.

uremia (ū-rē′mē-ă) [″ + *haima,* blood] In patients with renal failure, the intoxication caused by the body's accumulation of metabolic byproducts that are normally excreted by healthy kidneys. SEE: *azotemia; coma, uremic*. **uremic,** *adj.*

ETIOLOGY: Although nitrogen-containing waste products have long been considered the principal cause of uremia, other metabolic waste products, such as glycosylated wastes and byproducts of abnormal oxidation, may actually be the most important toxins responsible for uremia.

SYMPTOMS: Symptoms include nausea, vomiting, anorexia, headache, dizziness, coma, or convulsions.

TREATMENT: Dialysis removes many soluble waste products that accumulate in renal failure and helps to improve some conditions associated with uremia. Other uremic conditions can be partly alleviated with a protein-restricted diet, careful management of acid-base balance, and calcium and folate supplementation.

extrarenal u. Prerenal u.

prerenal u. Uremia resulting not from primary renal disease but from other conditions such as disturbances in circulation, fluid balance, or metabolism arising in other parts of the body. SYN: *extrarenal uremia*.

uremigenic (ū-rē″mĭ-jĕn′ĭk) [Gr. *ouron,* urine, + *haima,* blood, + *gennan,* to produce] Caused by or producing uremia.

ureogenesis (ūr″ē-ō-jĕn′ĕ-sĭs) [″ + *genesis,* generation, birth] Formation of urea.

ureotelic (ū″rē-ō-tĕl′ĭk) [*urea* + Gr. *telikos,* belonging to the completion] Concerning animals that excrete amino nitrogen in the form of urea. Included in this group are mammals. SEE: *urea cycle; uricotelic*.

uresis (ū-rē′sĭs) [Gr. *ouresis*] Urination.

ureter (ū′rĕ-ter, ū-rē′tĕr) [Gr. *oureter*] The tube that carries urine from the kidney to the bladder. It originates in the pelvis of the kidney and terminates in the posterior base of the bladder. Each kidney has one ureter measuring from 28 to 34 cm long, the right being slightly shorter than the left. The diameter varies from 1 mm to 1 cm. The wall consists of three layers: the mucosal, muscular, and fibrous layers. SEE: *kidney; urethra*.

ureteral (ū-rē′tĕr-ăl) Concerning the ureter. SYN: *ureteric*.

ureteralgia (ū″rē-tĕr-ăl′jē-ă) [″ + *algos,* pain] Pain in the ureter.

ureterectasis (ū-rē″tĕr-ĕk′tă-sĭs) [″ + *ektasis,* dilatation] Dilatation of the ureter.

ureterectomy (ū-rē″tĕr-ĕk′tō-mē) [″ + *ektome,* excision] Excision of a ureter.
ureteric (ū″rĕ-tĕr′ĭk) Ureteral.
ureteritis (ū-rē″tĕr-ī′tĭs) [″ + *itis,* inflammation] Inflammation of the ureters.
uretero- Combining form indicating *ureter.*
ureterocele (ū-rē′tĕr-ō-sēl) [″ + *kele,* tumor, swelling] Cystlike dilatation of the ureter near its opening into the bladder; usually a result of congenital stenosis of the ureteral orifice.
ureterocelectomy (ū-rē″tĕr-ō-sē-lĕk′tō-mē) [″ + ″ + *ektome,* excision] Surgical removal of a ureterocele.
ureterocervical (ū-rē″tĕr-ō-sĕr′vĭ-kăl) [″ + L. *cervicalis,* pert. to cervix] Concerning the ureter and the cervix uteri.
ureterocolostomy (ū-rē″tĕr-ō-kō-lŏs′tō-mē) [″ + *kolon,* colon, + *stoma,* mouth] The implantation of the ureter into the colon.
ureterocystoscope (ū-rē″tĕr-ō-sĭs′tō-skōp) [″ + *kystis,* bladder, + *skopein,* to examine] A cystoscope combined with a ureteral catheter. SYN: *ureterocystoscope*.
ureterocystoscope (ū-rē″tĕr-ō-sĭs′tō-skōp) [″ + ″ + *skopein,* to view] Uretercystoscope.
ureteroenterostomy (ū-rē″tĕr-ō-ĕn-tĕr-ŏs′tō-mē) [″ + *enteron,* intestine, + *stoma,* mouth] Formation of a passage between a ureter and the intestine.
ureterography (ū-rē″tĕr-ŏg′ră-fē) [″ + *graphein,* to write] Radiography of the ureter after injection of a radiopaque substance into it.
ureteroheminephrectomy (ū-rē″tĕr-ō-hĕm″ĭ-nĕ-frĕk′tō-mē) [″ + *hemi-,* half, + *nephros,* kidney, + *ektome,* excision] In cases of reduplication of the upper urinary tract on one side, surgical removal of the reduplicated portion.
ureterohydronephrosis (ū-rē″tĕr-ō-hī″drō-nĕ-frō′sĭs) [″ + *hydor,* water, + *nephros,* kidney, + *osis,* condition] Dilatation of the ureter and the pelvis of the kidney resulting from a mechanical or inflammatory obstruction in the urinary tract.
ureteroileostomy (ū-rē″tĕr-ō-ĭl″ē-ŏs′tō-mē) [″ + *ileum,* ileum, + *stoma,* mouth] Surgical anastomosis of a ureter to an isolated segment of the ileum. The ileum is connected to an abdominal stoma so that urine leaves the body via that opening.
ureterolith (ū-rē′tĕr-ō-lĭth) [″ + *lithos,* stone] A stone or calculus in the ureter.
ureterolithiasis (ū-rē″tĕr-ō-lĭth-ī′ăs-ĭs) [″ + ″ + *iasis,* condition] Development of a stone in the ureter.
ureterolithotomy (ū-rē″tĕr-ō-lĭth-ŏt′ō-mē) [″ + ″ + *tome,* incision] Surgical incision for removal of a stone from the ureter.
ureterolysis (ū-rē″tĕr-ŏl′ĭ-sĭs) [″ + *lysis,* dissolution] **1.** Rupture of a ureter. **2.** Paralysis of the ureter. **3.** The process of loosening adhesions around the ureter.
ureteroneocystostomy (ū-rē″tĕr-ō-nē″ō-sĭs-tŏs′tō-mē) [″ + *neos,* new, + *kystis,* bladder, + *stoma,* mouth] Surgical formation of a new passage between a ureter and the bladder.
ureteroneopyelostomy (ū-rē″tĕr-ō-nē″ō-pī-ĕ-lŏs′tō-mē) [″ + ″ + *pyelos,* pelvis, + *stoma,* mouth] Excision of a portion of the ureter with attachment of the severed end of the lower portion to a new aperture in the renal pelvis. SYN: *ureteropyelostomy*.
ureteronephrectomy (ū-rē″tĕr-ō-nĕf-rĕk′tō-mē) [″ + *nephros,* kidney, + *ektome,* excision] Removal of a kidney and its ureter.
ureteropelvioplasty (ū-rē″tĕr-ō-pĕl′vē-ō-plăs″tē) [Gr. *oureter,* ureter, + L. *pelvis,* basin, + Gr. *plassein,* to mold] Plastic surgery of the junction of the ureter and the pelvis of the kidney.
ureteroplasty (ū-rē′tĕr-ō-plăs″tē) [″ + *plassein,* to form] Plastic surgery of the ureter.
ureteroproctostomy (ū-rē″tĕr-ō-prŏk-tŏs′tō-mē) [″ + *proktos,* anus, + *stoma,* mouth] The formation of a passage from the ureter to the lower rectum.
ureteropyelitis (ū-rē″tĕr-ō-pī-ĕl-ī′tĭs) [″ + *pyelos,* pelvis, + *itis,* inflammation] Inflammation of the pelvis of the kidney and a ureter.
ureteropyelonephritis (ū-rē″tĕr-ō-pī″ĕl-ō-nĕf-rī′tĭs) [″ + ″ + *nephros,* kidney, + *itis,* inflammation] Inflammation of the renal pelvis and the ureter.
ureteropyeloplasty (ū-rē″tĕr-ō-pī′ĕl-ō-plăs″tē) [″ + ″ + *plassein,* to mold] Plastic surgery of the ureter and renal pelvis.
ureteropyelostomy (ū-rē″tĕr-ō-pī″ĕ-lŏs′tō-mē) [″ + ″ + *stoma,* mouth] Ureteroneopyelostomy.
ureteropyosis (ū-rē″tĕr-ō-pī-ō′sĭs) [″ + *pyon,* pus, + *osis,* condition] Suppurative inflammation within a ureter.
ureterorrhagia (ū-rē″tĕr-or-rā′jē-ă) [″ + *rhegnynai,* to burst forth] Hemorrhage from the ureter.
ureterorrhaphy (ū-rē″tĕr-or′ră-fē) [″ + *rhaphe,* seam, ridge] Suture of the ureter, as for fistula.
ureterosigmoidostomy (ū-rē″tĕr-ō-sĭg-moyd-ŏs′tō-mē) [″ + *sigma,* letter S, + *eidos,* shape, + *stoma,* mouth] Surgical implantation of the ureter into the sigmoid colon.
ureterostoma (ū″rē-tĕr-ŏs′tō-mă) [Gr. *oureter,* ureter, + *stoma,* mouth] The orifice through which the ureter enters the urinary bladder.
ureterostomy (ū-rē″tĕr-ŏs′tō-mē) [″ + *stoma,* mouth] The formation of a permanent fistula for drainage of a ureter.

cutaneous u. Surgical implantation of the ureter into the skin. This allows urine to drain via the ureter to the outside of the body by going through the stoma.

ureterotomy (ū-rē″tĕr-ŏt′ō-mē) [″ + *tome,* incision] Incision or surgery of the ureter.

ureterotrigonoenterostomy (ū-rē″tĕr-ō-trī-gō″nō-ĕn″tĕr-ŏs′tō-mē) [″ + *trigonon,* three-sided figure, + *enteron,* intestine, + *stoma,* mouth] Surgical removal of the trigone of the bladder with one or both of the ureteral openings and implantation of it into the intestine.

ureteroureterostomy (ū-rē″tĕr-ō-ū-rē″tĕr-ŏs′tō-mē) [″ + ″ + *stoma,* mouth] **1.** The formation of a connection from one ureter to the other. **2.** The re-establishment of a passage between the ends of a divided ureter.

ureterouterine (ū-rē″tĕr-ō-ū′tĕr-ĭn) [″ + L. *uterus,* womb] Concerning the ureter and uterus or a fistula between them.

ureterovaginal (ū-rē″tĕr-ō-văj′ĭ-năl) [″ + L. *vagina,* sheath] Relating to a ureter and the vagina, denoting a fistula connecting them.

ureterovesicostomy (ū-rē″tĕr-ō-vĕs″ĭ-kŏs′tō-mē) [″ + ″ + Gr. *stoma,* mouth] Reimplantation of a ureter into the bladder.

urethra (ū-rē′thră) [Gr. *ourethra*] The tube for the discharge of urine extending from the bladder to the outside. In females, its orifice lies in the vestibule between the vagina and clitoris; in males, the urethra passes through the prostate gland and the penis, opening at the tip of the glans penis. In males, it serves as the passage for semen as well as urine. Its lining, the mucosa, is thrown into folds and contains the openings of the urethral glands. Surrounding the mucosa is a lamina propria containing many elastic fibers and blood vessels, outside of which is an indefinite muscular layer. SEE: *penis*.

u. muliebris The female urethra.

u. virilis The male urethra.

urethral (ū-rē′thrăl) [Gr. *ourethra,* urethra] Relating to the urethra.

urethralgia (ū-rē-thrăl′jē-ă) [″ + *algos,* pain] Pain in the urethra.

urethratresia (ū-rē″thră-trē′zē-ă) [″ + *a-,* not, + *tresis,* a perforation] Occlusion or imperforation of the urethra.

urethrectomy (ū-rē-thrĕk′tō-mē) [″ + *ektome,* excision] Surgical excision of the urethra or part of it.

urethrism, urethrismus (ū′rē-thrĭzm, ū″rē-thrĭz′mŭs) [″ + *-ismos,* condition] Irritability or spasm of the urethra.

urethritis (ū″rē-thrī′tĭs) [″ + *itis,* inflammation] Inflammation of the urethra.

anterior u. Inflammation of that portion of the urethra anterior to the anterior layer of the triangular ligament.

gonococcal u. Urethritis caused by *Neisseria gonorrhoeae.*

nongonococcal u. ABBR: NGU. A urethral inflammation caused by organisms other than *Neisseria gonorrhoeae.* NGU is the most common sexually transmitted disease in men. It accounts for 4 to 6 million physician visits annually. Clinically the symptoms usually develop within about 7 to 14 days but may range from 2 to 35 days. The symptoms usually include painful urination and a urethral discharge. Because of the similarity of NGU to gonococcal urethritis, the disease is diagnosed from bacteriological culture of the discharge. The two organisms most frequently associated with NGU are *Chlamydia trachomatis* and *Ureaplasma urealyticum*. Other causes include herpes simplex virus, *Trichomonas vaginalis, Haemophilus influenzae, Gardnerella vaginalis,* and *Clostridium difficile*.

TREATMENT: NGU due to *C. trachomatis* or *U. urealyticum* is treated with doxycycline or azithromycin. Appropriate antibiotics are used for other causative organisms.

nonspecific u. ABBR: NSU. Nongonococcal u.

posterior u. Inflammation of membranous and prostatic portions of the urethra.

specific u. Urethritis due to a specific organism, usually gonococcus.

urethro- [Gr. *ourethra*] Combining form meaning *urethra.*

urethrobulbar (ū-rē″thrō-bŭl′băr) Concerning the urethra and the bulbar penis.

urethrocele (ū-rē′thrō-sēl) [″ + *kele,* tumor, swelling] **1.** Pouchlike protrusion of the urethral wall in the female. **2.** Thickening of connective tissue around the urethra in the female.

urethrocystitis (ū-rē″thrō-sĭs-tī′tĭs) [″ + *kystis,* bladder, + *itis,* inflammation] Inflammation of the urethra and bladder.

urethrocystopexy (ū-rē″thrō-sĭs′tō-pĕk″sē) [″ + *kystis,* bladder, + *pexis,* fixation] Plastic surgery of the urethral-bladder junction to relieve urinary stress incontinence.

urethrograph (ū-rē′thrō-grăf) A device for recording the caliber of the urethra.

urethrography (ū-rē-thrŏg′ră-fē) [″ + *graphein,* to write] Radiography of the urethra after it has been filled with contrast medium.

voiding u. Radiographic examination of the urethra during urination after the introduction of a contrast medium.

urethrometer (ū-rē-thrŏm′ĕt-ĕr) [Gr. *ourethra,* urethra, + *metron,* mea-

sure] An instrument for measuring the diameter of the urethra or the lumen of a stricture.

urethropenile (ū-rē″thrō-pē′nīl) [″ + L. *penis,* penis] Relating to the urethra and penis.

urethroperineal (ū-rē″thrō-pĕr-ĭ-nē′ăl) [″ + *perinaion,* perineum] Rel. to the urethra and perineum.

urethroperineoscrotal (ū-rē″thrō-pĕr-ĭ-nē″ō-skrō′tăl) [″ + ″ + L. *scrotum,* a bag] Relating to the urethra, perineum, and scrotum.

urethropexy (ū-rē′thrō-pĕks-ē) [″ + Gr. *pexis,* fixation] Surgical fixation of the urethra.

urethrophraxis (ū-rē-thrō-frăks′ĭs) [″ + *phrassein,* to obstruct] Urethral obstruction.

urethroplasty (ū-rē′thrō-plăs″tē) [″ + *plassein,* to mold] Reparative surgery of the urethra.

urethroprostatic (ū-rē″thrō-prŏs-tăt′ĭk) Concerning the urethra and prostate.

urethrorectal (ū-rē″thrō-rĕk′tăl) [Gr. *ourethra,* urethra, + L. *rectus,* straight] Rel. to the urethra and rectum.

urethrorrhagia (ū-rē″thror-ā′jē-ă) [″ + *rhegnynai,* to burst forth] Hemorrhage from the urethra.

urethrorrhaphy (ū-rē-thror′ăf-ē) [″ + *rhaphe,* seam, ridge] Suture of the urethra or of a urethral fistula.

urethrorrhea (ū-rē″thror-ē′ă) [″ + *rhoia,* flow] An abnormal discharge from the urethra.

urethroscopy (ū-rē-thrŏs′kō-pē) An examination of the mucous membrane of the urethra with a urethroscope.

urethrospasm (ū-rē′thrō-spăzm) [″ + *spasmos,* a convulsion] Spasmodic stricture of the urethra.

urethrostenosis (ū-rē″thrō-stĕn-ō′sĭs) [″ + *stenosis,* act of narrowing] Stricture of the urethra.

urethrostomy (ū-rē-thrŏs′tō-mē) [″ + *stoma,* mouth] The formation of a permanent fistula opening into the urethra by perineal section and fixation of the membranous urethra in the perineum.

urethrotome (ū-rē′thrō-tōm) [″ + *tome,* incision] An instrument for incision of a urethral stricture.

urethrotomy (ū-rē-thrŏt′ō-mē) Incision of a urethral stricture.

urethrotrigonitis (ū-rē″thrō-trī″gō-nī′tĭs) [″ + *trigonon,* three-sided figure, + *itis,* inflammation] Inflammation of the urethra and the trigone of the bladder.

urethrovaginal (ū-rē″thrō-văj′ĭ-năl) [″ + L. *vagina,* sheath] Pert. to the urethra and vagina.

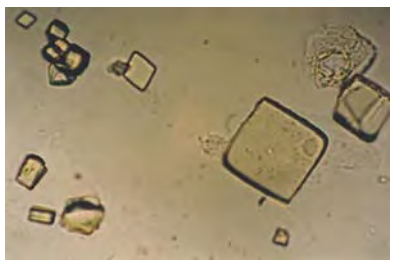
urethrovesical (ū-rē″thrō-vĕs′ĭ-kăl) [″ + L. *vesicula,* little bladder] Concerning the urethra and the bladder.

urgency A sudden, almost uncontrollable need to urinate.

URI *upper respiratory infection.*

uric (ū′rĭk) [Gr. *ourikos,* urine] Of or pert. to urine.

uric acid A crystalline acid, $C_5H_4N_4O_3$, occurring as an end product of purine metabolism. It is formed from purine bases derived from nucleic acids (DNA and RNA). It is a common constituent of urinary stones and gouty tophi. SEE: illus.



URIC ACID CRYSTALS (×400)

OUTPUT: The uric acid output should be between 0.8 and 1 g/day if the patient is on an ordinary diet. Uric acid must be excreted because it cannot be metabolized.

Increased elimination is observed after ingestion of proteins and nitrogenous foods, after exercise, after administration of cytotoxic agents, and in gout and leukemia. Decreased elimination is observed in kidney failure, lead poisoning, and in people who eat a protein-free diet.

endogenous u.a. Uric acid derived from purines undergoing metabolism from the nucleic acid of body tissues.

exogenous u.a. Uric acid derived from purines from food made up of free purines and nucleic acids. SEE: *urate; uraturia*.

uricacidemia (ū″rĭk-ăs-ĭd-ē′mē-ă) [Gr. *ourikos,* urine, + L. *acidus,* sour, + Gr. *haima,* blood] Hyperuricemia.

uricaciduria (ū″rĭk-ăs-ĭd-ū′rē-ă) [″ + ″ + Gr. *ouron,* urine] Excessive uric acid in the urine.

uricase (ū′rĭ-kāz) [″ + *-ase,* enzyme] An enzyme present in the liver and kidneys of most mammals, but not humans. This enzyme is capable of oxidizing uric acid into allantoin and carbon dioxide.

uricemia (ū-rĭ-sē′mē-ă) [″ + *haima,* blood] An obsolete term for hyperuricemia.

uricosuria (ū″rĭ-kō-sū′rē-ă) [″ + *ouron,* urine] The excessive excretion of uric acid in the urine.

uricosuric (ū″rĭ-kō-sū′rĭk) Potentiating the excretion of uric acid in the urine.

uricosuric agent A drug (such as probenecid) that increases the urinary excretion of uric acid, thereby reducing the concentration of uric acid in the blood. It is used to treat gout.

PATIENT CARE: The health care pro-

fessional assesses the patient for a history of gastrointestinal complaints or ulceration and for drug sensitivities and drug regimens to prevent interactions. The patient should take drugs with milk or food. Fluid intake of at least 3 L /day is advised (unless contraindicated), and alkalinization of urine with sodium bicarbonate and alkaline-ash diet to prevent uric acid crystallization until serum urate levels return to normal. The patient should avoid the use of salicylates while taking probenecid; the patient may use acetaminophen for analgesia. Gastrointestinal side effects should be reported.

uricotelic (ūr″ĭ-kō-tĕl′ĭk) [″ + *telikos,* belonging to the completion] Concerning animals that excrete amino nitrogen in the form of uric acid. Included in this group are birds and reptiles. SEE: *urea cycle; ureotelic*.

uridine (ūr′ĭ-dĭn) A nucleoside that is one of the four main riboside components of ribonucleic acid. It consists of uracil and D-ribose.

u. diphosphate A uridine-containing nucleotide important in certain metabolic reactions, in which it transports sugars such as glucose and galactose.

uridrosis (ū-rĭ-drō′sĭs) [″ + *hidrosis*, a sweating] The presence of urea in the sweat. Evaporation may show white scales, the crystals of urea.

urin- SEE: *urino-*.

urinal (ū′rĭn-ăl) [L. *urina,* urine] **1.** A container into which one urinates. **2.** A toilet or bathroom fixture for receiving urine and flushing it away.

condom u. Condom catheter.

urinalysis (ū″rĭ-năl′ĭ-sĭs) [″ + Gr. *ana,* apart, + *lysis,* a loosening] Analysis of the urine. SEE: *urine*.

COLLECTION OF URINE: For a routine urinalysis, a voided specimen of urine in a clean container is usually sufficient. For culture, either a clean-catch or a catheterized specimen is required. For a clean-catch specimen, the individual cleanses the perineum or glans penis with soap and water or an antiseptic solution such as benzalkonium chloride before voiding. A midstream specimen of urine is then collected in a sterilized container. A catheterized specimen is obtained by passing a catheter into the bladder, using sterile technique. SEE: *suprapubic catheter*.

NOTE: A urine specimen may be obtained to test for excretion of drugs of abuse. In such cases, care must be taken to ensure that appropriate consent is obtained, and the specimen was produced by the individual and that there was no opportunity for the specimen to be diluted.

urinary (ū′rĭ-nār″ē) [L. *urina,* urine] Pert. to, secreting, or containing urine.

urinary bladder SEE: under *bladder*.

urinary calculus A stone formed in the urinary passages. These vary in composition but may contain urates, calcium, oxalate, calcium carbonate, phosphates, and cystine. SEE: *calculus, renal; lithotriptor*.

PATIENT CARE: The patient is encouraged to verbalize anxieties and concerns regarding severe pain. Pain relief measures are instituted as prescribed; they include analgesics, antispasmodics, and warm, moist heat. All urine is strained for stones, and any calculus is sent for laboratory analysis. If a lithotriptor is to be used, the duration of the procedure and follow-up care are explained. All diagnostic studies are explained and the patient is encouraged to verbalize fears and concerns. Urine is observed for hematuria, and voided specimens are tested for specific gravity. Vital signs are monitored; if temperature is elevated, antipyretic measures are instituted as ordered. Fluids are forced to enhance dilution of urine, and intake and output are monitored. The health care professional stays alert for complications such as infection, stasis, and retention. A catheter is inserted as ordered. Dietary management is based on the composition of the stone. If phosphate stones are present, patients should increase their intake of acid-ash foods such as cereals, eggs, meat, and cranberry and grape juices. Persons prone to uric acid stones should consume an alkaline-ash diet of green vegetables and fruits. To minimize urinary tract infections, esp. for female patients, the patient is taught proper perineal hygiene, and the need for increased fluid intake is emphasized.

urinary director appliance A hand-held, hollow, plastic device that fits over the vulva, enabling a woman to urinate while standing. The device collects urine and allows it to be directed away from the user through an outlet spout. Intended use is for women who are active outdoors and need to urinate without partially disrobing. Medically, the appliance has been found to be useful in patients who have had a radical vulvectomy.

Other devices for use by women in collecting urine are available. Some of these have the capacity to contain the specimen for disposal rather than merely redirecting the flow.

urinary diversion The surgical redirection of urine flow. SEE: *Nursing Diagnoses Appendix.*

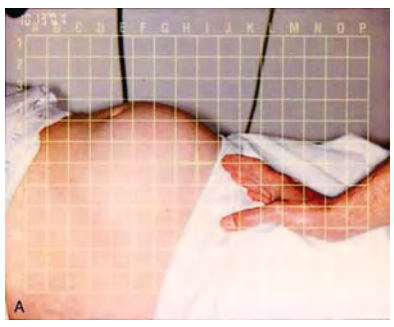
urinary elimination, impaired Disturbance in urine elimination. SEE: *Nursing Diagnoses Appendix.*

urinary elimination, readiness for enhanced A pattern of urinary functions that is sufficient for meeting elimina-

tory needs and can be strengthened. SEE: *Nursing Diagnoses Appendix.*

urinary incontinence Loss of control over urination. SEE: *incontinence; incontinence, stress urinary*.

urinary retention The state in which the individual experiences incomplete emptying of the bladder. High urethral pressure inhibits voiding until increased abdominal pressure causes urine to be involuntarily lost, or high urethral pressure inhibits complete emptying of the bladder. SEE: illus.*; Nursing Diagnoses Appendix.*



URINARY RETENTION
(A) Massive distention of the bladder by two liters of urine. (B) After catheterization of the bladder.

urinary system The organ system that includes the kidneys, ureters, bladder, and urethra. The kidneys form urine from blood plasma by filtration, reabsorption, and secretion. The formation of urine includes the excretion of waste products, but the kidneys also regulate the water and mineral content and the acid-base balance of the blood and all other body fluids. The other organs of the system are concerned with the elimination of urine after it has been formed. SEE: illus.

urinary tract infection ABBR: UTI. Infection of the kidneys, ureters, or bladder by microorganisms that either ascend from the urethra (95% of cases) or that spread to the kidney from the bloodstream (5%). About 7 million American patients visit health care providers each year because of UTIs. These infections commonly occur in otherwise healthy women, men with prostatic hypertrophy or bladder outlet obstruction, children with congenital anatomical abnormalities of the urinary tract, and patients with indwelling bladder catheters. SEE: *clean-catch method; cystitis; pyelonephritis; urethritis*.

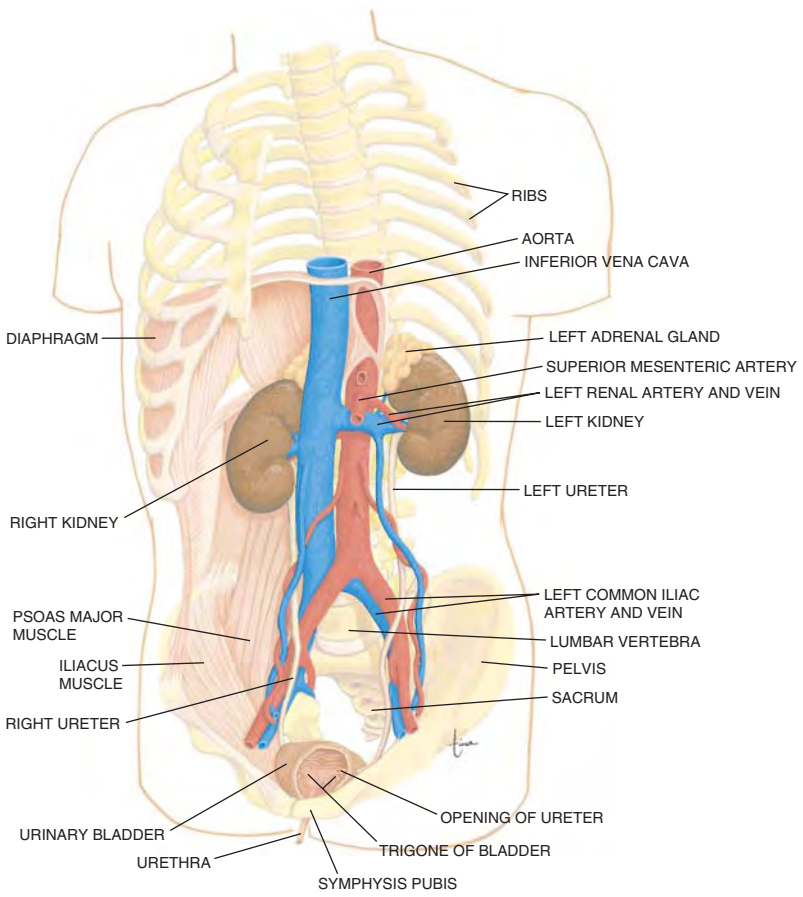
ETIOLOGY: *Escherichia coli* causes about 80% of all UTIs. In young women, *Staphylococcus saprophyticus* is also common. In men with prostate disease, enterococci are often responsible. The small remaining percentage of infections may be caused by *Klebsiella* species, *Proteus mirabilis, Staphylococcus aureus, Pseudomonas aeruginosa,* or other virulent organisms.

SYMPTOMS: The presenting symptoms of UTI vary enormously. Young patients with bladder infections may have pain with urination; urinary frequency or urgency, or both; pelvic or suprapubic discomfort; low-grade fevers; or a change in the appearance or odor of their urine. Older patients may present with fever, confusion, or coma caused by urosepsis. Patients with pyelonephritis often complain of flank pain, prostration, nausea, vomiting, and high fevers. UTI may also be asymptomatic, esp. during pregnancy. Asymptomatic UTI during pregnancy is a contributing factor to maternal pyelonephritis, or fetal prematurity and stillbirth.

DIAGNOSIS: Urinalysis and subsequent urinary culture are used to determine the presence of UTI, the culprit microorganism, and the optimal antibiotic therapy. A dipstick test may identify leukocyte esterase and nitrite in a urinary specimen, strongly suggesting a UTI. The presence of more than 8 to 10 white blood cells per high-power field of spun urine also strongly suggests UTI, as does the presence of bacteria in an uncentrifuged urinary specimen.

TREATMENT: Sulfa drugs, nitrofurantoin, cephalosporins, or quinolones may be used for the outpatient treatment of UTIs while the results of cultures are pending. Patients sick enough to be hospitalized may also be treated with intravenous aminoglycosides, medicine to treat nausea and vomiting, and hydration. The duration of therapy and the precise antibiotics used depend on the responsible organism and the underlying condition of the patient. Patients with anatomical abnormalities of the urinary tract (e.g., children with ureteropelvic obstruction, or older men with bladder outlet obstruction) may sometimes require urological surgery.

RISK FACTORS: The following conditions predispose sexually active women



URINARY SYSTEM

to development of UTI: the use of a contraceptive diaphragm, the method of sexual intercourse (i.e., greatly prolonged or cunnilingus), and failure to void immediately following intercourse.

PREVENTION OF UTI IN YOUNG WOMEN: Fluid intake should be increased to six to eight glasses daily; the anal area should be wiped from front to back to prevent carrying bacteria to the urethral area; the bladder should be emptied shortly before and after intercourse; the genital area should be washed before intercourse; if vaginal dryness is a problem, water-soluble vaginal lubricants should be used before intercourse; a contraceptive diaphragm or sponge should not remain in the vagina longer than necessary. An alternative method of contraception should be considered.

PATIENT CARE: Patient teaching should emphasize self-care procedures and prevention of recurrent episodes. The medication regimen should be explained, and the patient should be aware of signs and symptoms and, when they occur, should report them promptly to the primary caregiver.

urinate (ūʹrĭ-nāt) [L. *urinare,* to discharge urine] To pass urine from the bladder. SYN: *micturate*.

urination (ūʺrĭ-nāʹshŭn) [L. *urinatio,* a discharging of urine] The release of urine from the body. SYN: *micturition; uresis*.

DIFFERENTIAL DIAGNOSIS: Increased frequency is seen in polydipsia; polyuria; diabetes mellitus and diabetes insipidus; irritation of the bladder, urethra, or urinary meatus; diseases of the spinal cord; enlarged prostate in males; pregnancy in females; beer drinking; interstitial nephritis; use of medications (e.g., diuretics); and phimosis. Decreased frequency occurs after dehydration, sweating, diarrhea, or bleeding;

and in anuria, oliguria, uremia, and anticholinergic drug use. SEE: *urine*.

urine (ū′rĭn) [L. *urina;* Gr. *ouron,* urine] The fluid and dissolved solutes (including salts and nitrogen-containing waste products) that are eliminated from the body by the kidneys. SEE: tables.

COMPOSITION: Urine consists of approx. 95% water and 5% solids. Solids amount to 30 to 70 g/L and include the following (values are in grams per 24 hr unless otherwise noted): *Organic substances:* urea (10 to 30), uric acid (0.8 to 1.0), creatine (10 to 40 mg/24 hr in men and 10 to 270 mg/24 hr in women), creatinine (15 to 25 mg/kg of body weight per day), ammonia (0.5 to 1.3). *Inorganic substances:* chlorides (110 to 250 nmol/L depending on chloride intake), calcium (0.1 to 0.2), magnesium (3 to 5 nmol/24 hr), phosphorus (0.4 to 1.3). *Osmolarity:* 0.1 to 2.5 mOsm/L.

In addition to the foregoing, many other substances may be present depending on the diet and state of health of the individual. Among component substances indicating pathological states are abnormal amounts of albumin, glucose, ketone bodies, blood, pus, casts, and bacteria. SEE: illus.

double-voided u. A urine sample voided within 30 min after the patient has emptied the bladder.

midstream specimen of u. A urinary specimen collected after the first few milliliters of urine are voided and discarded. SEE: *clean-catch method*.

residual u. Urine left in the bladder after urination, an abnormal occurrence that may accompany enlargement of the prostate. SYN: *post-void residual*.

urino-, urin- Combining forms meaning *urine.* SEE: *uro-*.

urinogenital (ū″rĭ-nō-jĕn′ĭ-tăl) [″ + *genitalia,* genitals] Urogenital.

urinoma (ū″rĭ-nō′mă) [″ + Gr. *oma,* mass] A cyst containing urine.

urinometer (ū″rĭ-nŏm′ĕ-tĕr) [″ + Gr. *metron,* measure] A device, a form of hydrometer, for determining the specific gravity of urine. SEE: *hydrometer*.

urinophil (ū′rĭ-nō-fĭl) [″ + Gr. *philein,* to love] Capable of existing in the urine, such as bacteria that grow well in the urinary bladder or in urine.

urinose, urinous (ū′rĭ-nōs, ū′rĭ-nŭs) [L. *urina,* urine] Having the characteristics of or containing urine.

uriposia (ū″rĭ-pō′zē-ă) [″ + *posis,* drinking] Drinking of urine.

uro- [Gr. *ouron,* urine] Combining form meaning *urine.* SEE: *urino-*.

uroammoniac (ū″rō-ă-mō′nē-ăk) Containing urine and ammonia.

urobilin (ū″rō-bī′lĭn) [″ + L. *bilis,* bile] A brown pigment formed by the oxidation of urobilinogen, a decomposition product of bilirubin. Urobilin may be formed from the urobilinogen in stools or in urine after exposure to air.

urobilinemia (ū″rō-bī″lĭn-ē′mē-ă) [″ + ″ + Gr. *haima,* blood] Urobilin in the blood.

urobilinicterus (ū″rō-bī-lĭn-ĭk′tĕr-ŭs) [″ + L. *bilis,* bile, + Gr. *ikteros,* jaundice] Jaundice resulting from urobilinemia.

urobilinogen (ū″rō-bī-lĭn′ō-jĕn) [″ + ″ + Gr. *gennan,* to produce] A colorless derivative of bilirubin, from which it is formed by the action of intestinal bacteria.

urobilinogenemia (ū″rō-bī″lĭn-ō-jĕn-ē′mē-ă) [″ + ″ + ″ + *haima,* blood] Urobilinogen in the blood.

urobilinuria (ū″rō-bī″lĭn-ū′rē-ă) [″ + ″ + Gr. *ouron,* urine] Excess of urobilin in the urine.

urocele (ū′rō-sēl) [″ + *kele,* tumor, swelling] Escape of urine into the scrotum. SYN: *uroscheocele*.

urochesia (ū-rō-kē′zē-ă) [″ + *chezein,* to defecate] A discharge of urine in the feces.

urochrome (ū′rō-krōm) [″ + *chroma,* color] The pigment that gives urine its characteristic color. It is derived from urobilin.

urocyanin (ū-rō-sī′ă-nĭn) [″ + *kyanos,* blue] A blue pigment present in the urine in certain diseases.

urocyanogen (ū″rō-sī-ăn′ō-jĕn) [″ + ″ + *gennan,* to produce] A blue pigment in urine, esp. in cholera patients.

urocyanosis (ū″rō-sī-ăn-ō′sĭs) [″ + ″ + *osis,* condition] Blue discoloration of the urine; possibly due to the presence of indigo blue from oxidation of indican or to ingestion of drugs such as methylene blue. SEE: *indicanuria*.

urodynamics (ū″rō-dī-năm′ĭks) The study of the holding or storage of urine in the bladder, the facility with which it empties, and the rate of movement of urine out of the bladder during micturition.

urodynia (ū″rō-dĭn′ē-ă) [″ + *odyne,* pain] Pain associated with urination.

uroerythrin (ū″rō-ĕr′ĭth-rĭn) [″ + *erythros,* red] A reddish pigment sometimes present in urine.

uroflavin (ū″rō-flā′vĭn) A fluorescent compound present in the urine of persons taking riboflavin.

uroflow (ūr′ŭ-flō″) [G. *ourikos,* urine, AS. *flowan,* to flow] The volume of urine voided in a specified period. Low flow rates associated with high bladder pressures occur in bladder outlet obstruction.

uroflowmeter (ū″rō-flō′mē″tĕr) A device for recording urine flow; used to quantitate obstruction to urine flowing from the bladder.

urofuscin (ū″rō-fūs′ĭn) [″ + L. *fuscus,* dark brown] A red-brown pigment

Significance of Changes in Urine

QUANTITY		
Normal	**Abnormal**	**Significance**
1000–3000 ml/day		Varies with fluid intake, food consumed, exercise, temperature, kidney function
	High (polyuria >3000 ml/day)	Diabetes insipidus, diabetes mellitus, water intoxication, chronic nephritis, diuretic use
	Low (oliguria)	Dehydration, hemorrhage, diarrhea, vomiting, urinary obstruction, or many intrinsic kidney diseases
	None (anuria)	Same as oliguria
COLOR		
Normal	**Abnormal**	**Significance**
Yellow to amber		Depends on concentration of urochrome pigment
	Pale	Dilute urine, diuretic effect
	Milky	Fat globules, pus, crystals
	Red	Drugs, blood or muscle pigments
	Green	Bile pigment (jaundiced patient)
	Brown-black	Toxins, hemorrhage, drugs, metabolites
HEMATURIA (blood in urine)		
Normal	**Abnormal**	**Significance**
0–2 RBC/high-powered field (hpf)		Normal (physiological) filtration
	3 or more RBCs/hpf	Extrarenal: urinary tract infections, cancers, or stones. Renal: infections, trauma, malignancies, glomerulopathies, polycystic kidneys
PYURIA (leukocytes in urine)		
Normal	**Abnormal**	**Significance**
0–9 leukocytes per hpf		
	10 or more leukocytes/hpf	Urinary tract infection, urethritis, vaginitis, urethral syndrome, pyelonephritis, and others
PROTEINURIA		
Normal	**Abnormal**	**Significance**
10–150 mg/day		
	30–300 mg/day of albumin	Indicative of initial glomerular leakage in diabetes mellitus or hypertension (microalbuminuria)
	>300 mg/day	Macroalbuminuria. Indicative of progressive kidney failure. Injury to glomeruli or tubulointerstitium of kidney.
	>3500 mg/day	Nephrotic range proteinuria. Evaluation may include kidney biopsy.

Table continued on following page

Significance of Changes in Urine (Continued)

SPECIFIC GRAVITY		
Normal	**Abnormal**	**Significance**
1.010–1.025		Varies with hydration
	1.010 (Low)	Excessive fluid intake, impaired kidney concentrating ability
	>1.025 (High)	Dehydration, hemorrhage, salt-wasting, diabetes mellitus, and others

ACIDITY		
Normal	**Abnormal**	**Significance**
Acid (slight)		Diet of acid-forming foods (meats, eggs, prunes, wheat) overbalances the base-forming foods (vegetables and fruits)
	High acidity	Acidosis, diabetes mellitus, many pathological disorders (fevers, starvation)
	Alkaline	Vegetarian diet changes urea into ammonium carbonate; infection or ingestion of alkaline compounds

sometimes found in samples of urine, esp. in cases of porphyrinuria.

urofuscohematin (ū″rō-fŭs″kō-hĕm′ăt-ĭn) [″ + ″ + Gr. *haima,* blood] A reddish-brown pigment in urine in some diseases.

urogastrone (ū″rō-găs′trōn) [″ + *gaster,* belly] A polypeptide present in urine that has an inhibitory effect on gastric secretion.

urogenital (ū″rō-jĕn′ĭ-tăl) [″ + L. *genitalia,* genitals] Pert. to the urinary and reproductive organs. SYN: *urinogenital*.

urogenital system The urinary and reproductive systems combined. SEE: *genitalia* for illus.

urogenous (ū-rŏj′ĕn-ŭs) [″ + *gennan,* to produce] **1.** Producing urine. **2.** Originating in urine.

urogram (ū′rō-grăm) [″ + *gramma,* something written] A radiograph of the urinary tract.

urography (ū′rŏg′ră-fē) [Gr. *ouron,* urine, + *graphein,* to write] Radiography of the urinary tract after the introduction of a contrast medium.

ascending u. Urography in which the radiopaque dye is injected into the bladder during cystoscopy. SYN: *cystoscopic urography; retrograde urography*.

cystoscopic u. Ascending u.

descending u. Urography in which an injected dye is excreted by the kidney and studied by x-ray examination during excretion. SYN: *excretory urography; intravenous urography*.

excretory u. Descending u.

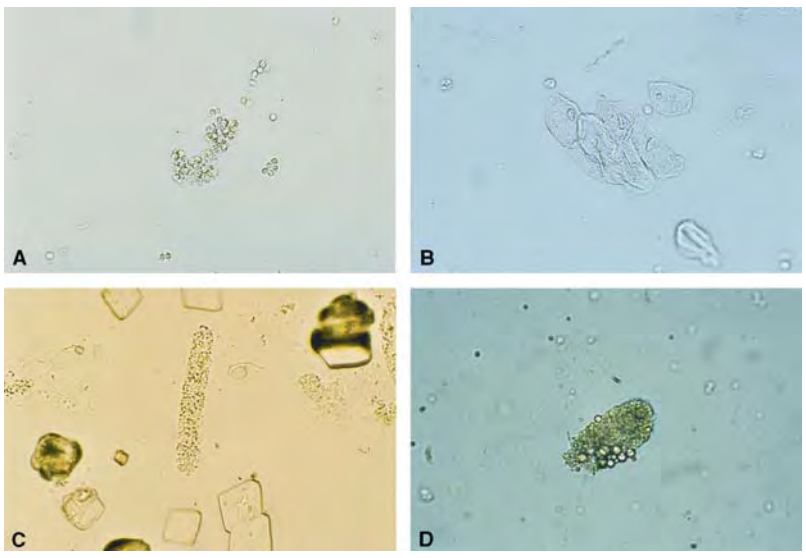
intravenous u. Descending u.

retrograde u. Ascending u.

urohematin (ū″rō-hĕm′ăt-ĭn) [″ + *haima,* blood] Pigment in urine, considered as identical with hematin, that alters the color of urine in proportion to the degree of oxidation.

Common Disorders of Urination

Anuria	Complete (or nearly complete) absence of urination
Diversion	Drainage of urine through a surgically constructed passage (e.g., a ureterostomy or ileal conduit)
Dysuria	Painful or difficult urination (e.g., in urethritis, urethral stricture, urinary tract infection, prostatic hyperplasia, or bladder atony)
Enuresis	Involuntary discharge of urine, esp. by children at night (bedwetting)
Incontinence	Loss of control over urination from any cause (e.g., from involuntary relaxation of urinary sphincter muscles or overflow from a full or paralyzed bladder)
Nocturia	Excessive urination at night
Oliguria	Decreased urinary output (usually less than 500 ml/day), often associated with dehydration, shock, hemorrhage, acute renal failure, or other conditions in which renal perfusion or renal output are impaired
Polyuria	Increased urinary output (usually more than 3000 ml/day), such as occurs in diabetes mellitus, diabetes insipidus, and diuresis



URINE
(A) white blood cells, (B) squamous epithelial cells, (C) granular cast and uric crystals, (D) fat body (×400)

urohematonephrosis (ū″rō-hĕm″ă-tō-nĕ-frō′sĭs) [″ + ″ + *nephros,* kidney] A pathological condition of the kidney in which the pelvis is distended with blood and urine.

urohematoporphyrin (ū″rō-hĕm″ă-tō-por′fĭr-ĭn) [″ + ″ + *porphyra,* purple] Iron-free hematin in urine when intravascular hemolysis occurs.

urokinase (ū-rō-kī′nās) An enzyme obtained from human urine; used to dissolve venous thrombi and pulmonary emboli. It is administered intravenously.

urokinetic (ū″rō-kĭ-nĕt′ĭk) [″ + *kinesis,* movement] Resulting reflexly from stimulation of the urinary organs.

urolagnia (ū-rō-lăg′nē-ă) [″ + *lagneia,* lust] Sexual excitation associated with urine or urination (e.g., watching another person urinate or having another person urinate on one's own body). SEE: *undinism*.

urolith (ū′rō-lĭth) [″ + *lithos,* stone] A concretion in the urine.

urolithiasis (ū″rō-lĭ-thī′ă-sĭs) [″ + ″ + *-iasis,* condition] The formation of kidney stones. SEE: *Nursing Diagnoses Appendix.*

urolithic (ū″rō-lĭth′ĭk) Concerning kidney stones.

urological (ū-rō-lŏj′ĭk-ăl) [″ + *logos,* word, reason] Pert. to urology.

urologist (ū-rŏl′ō-jĭst) A physician who specializes in the practice of urology.

urology (ū-rŏl′ō-jē) [″ + *logos,* word, reason] The branch of medicine concerned with the urinary tract in both sexes and the male genital tract.

urolutein (ū-rō-lū′tē-ĭn) [″ + L. *luteus,* yellow] A yellow pigment seen in the urine.

uromedulin, human (ū″rō-mĕd′ū-lĭn) The most abundant protein of renal origin in normal urine. This glycoprotein is the same protein termed Tamm-Horsfall mucoprotein. SEE: *mucoprotein, Tamm-Horsfall*.

uromelanin (ū-rō-mĕl′ăn-ĭn) [″ + *melas,* black] A black pigment occurring in urine resulting from the decomposition of urochrome.

uromelus (ū-rŏm′ē-lŭs) [Gr. *oura,* tail, + *melos,* limb] A congenitally deformed fetus in which the lower extremities are fused. SYN: *sirenomelia*.

uronephrosis (ū″rō-nĕf-rō′sĭs) [″ + *nephros,* kidney, + *osis,* condition] Dilatation of the renal structures from obstruction of the urinary flow; distention of the renal pelvis and tubules with urine. SYN: *hydronephrosis*.

uropathogen (ū″rō-păth′ō-jĕn) [″ + *pathos,* disease, suffering, + *gennan,* to produce] A microorganism capable of causing disease of the urinary tract.

uropathy (ū-rŏp′ă-thē) Any disease affecting the urinary tract.

obstructive u. Any disease that blocks the flow of urine (e.g., prostatic hyperplasia).

uropepsin (ū″rō-pĕp′sĭn) The end product of pepsin metabolism. It is excreted in the urine.

urophein, urophaein (ū″rō-fē′ĭn) [″ + *phaios,* gray] Gray pigment sometimes found in urine.

urophosphometer (ū″rō-fŏs-fŏm′ĕ-tĕr) [″ + L. *phosphas,* phosphorus] A device for estimating the amount of phosphorus in the urine.

uropoiesis (ū″rō-poy-ē′sĭs) [Gr. *ouron,* urine, + *poiesis,* production] The formation of urine by the kidneys.

uropoietic (ū″rō-poy-ĕt′ĭk) [″ + *poiein,* to form] Pert. to the formation of urine.

uroporphyria (ū″rō-por-fĭr′ē-ă) Porphyria in which an excess amount of uroporphyrin is excreted in the urine.

uroporphyrin (ū″rō-por′fĭ-rĭn) A red pigment present in the urine and feces in cases of porphyria; may also be present in the urine of persons taking certain drugs.

uroporphyrinogen (ū″rō-por″fĭ-rĭn′ō-jĕn) Any one of several porphyrins that are the precursors of uroporphyrins.

u. I An abnormal isomer of a precursor of protoporphyrin, which accumulates in one form of porphyria. It causes the urine to be red, the teeth to fluoresce brightly in ultraviolet light, and the skin to be abnormally sensitive to sunlight. This is observed in congenital erythropoietic porphyria.

uropsammus (ū″rō-săm′ŭs) [″ + *psammos,* sand] Gravel or calcified sediment in the urine.

uropyoureter (ū″rō-pī″ō-ū-rē′tĕr) [″ + ″ + *oureter,* ureter] Accumulation of urine and pus in the ureter.

uroscheocele (ū-rŏs′kē-ō-sēl) [″ + *oscheon,* scrotum, + *kele,* tumor, swelling] Urocele.

uroschesis (ū-rŏs′kĕs-ĭs) [″ + *schesis,* a holding] **1.** Suppression of urine. **2.** Retention of urine.

uroscopy (ū-rŏs′kō-pē) [″ + *skopein,* to examine] **1.** Examination of the urine. **2.** Diagnosis by examination of the urine.

urotoxin (ū″rō-tŏk′sĭn) Toxic substances in the urine.

uroureter (ū″rō-ū′rĕ-tĕr, ū″rō-ū-rē′tĕr) [″ + *oureter,* ureter] Distention of the ureter with urine caused by stricture or obstruction.

uroxanthin (ū″rō-zăn′thĭn) [″ + *xanthos,* yellow] Yellow pigment of the urine; an indigo-forming substance.

uroxin (ū-rŏk′sĭn) [″ + *oxys,* sharp] Alloxantin, a derivative of alloxan.

ursodiol A drug used to treat biliary diseases, including gallstones and primary biliary cirrhosis. SEE: *gallstone*.

urtica (ŭr-tī′kă) *pl.* **urticae** [L., nettle] Wheal.

urticant (ŭr′tĭ-kănt) That which causes hives.

urticaria (ŭr-tĭ-kā′rē-ă) [L. *urtica,* nettle] Multiple swollen raised areas on the skin that are intensely itchy and last up to 24 hr; they may appear primarily on the chest, back, extremities, face, or scalp. SYN: *hives*. SEE: illus.; *allergy; angioedema*.

URTICARIA

ETIOLOGY: Urticaria is caused by vasodilation and increased permeability of capillaries of the skin as the result of mast cell release of vasoactive mediators. The mast cell degranulation is the result of an immunoglobulin E–mediated reaction to allergens (e.g., foods, drugs, or drug additives), heat, cold, and, rarely, infections or emotions. Urticaria is a primary sign of local and systemic anaphylactic reactions. It affects people of all ages but is most common between 20 and 40 years of age. Urticaria is closely related to angioedema, which causes edema in deeper regions of the skin and subcutaneous tissue.

TREATMENT: Drugs that block histamine-1 (H_1) receptors (antihistamines) are the primary treatment for urticaria. The use of both H_1 and H_2 receptor blockers has been recommended but has not been proven more effective. Patients should avoid identified allergens. Corticosteroids are not usually used.

aquagenic u. Urticaria caused by exposure of the skin to ordinary water.

u. bullosa Eruption of temporary vesicles with infusion of fluid under the epidermis.

cholinergic u. Urticaria that develops after exposure to high ambient temperatures (e.g., after exercise, a warm shower or bath, or during a fever). The hives that develop are typically small (1 to 3 mm) and often are surrounded by red wheals. SYN: *generalized heat urticaria*.

chronic u. Urticaria that occurs on a frequent basis for 6 weeks or more. It is often associated with autoimmune disease.

cold u. Cold-induced urticarial eruption that may progress to angioedema.

u. factitia Urticaria following slight irritation of the skin.

generalized heat u. Cholinergic urticaria.

giant u. Angioedema.

u. medicamentosa Urticaria due to certain drugs.

papular u. A form of urticaria in which the wheal is followed by a lingering papule that is attended by considerable itching; most commonly observed in debilitated children. SYN: *prurigo simplex*.

physical u. Hives that result from the direct effects of physical forces applied to the skin. Cold temperature (cold urticaria), pressure (pressure urticaria), ultraviolet radiation (solar urticaria), and scratching (dermographism) are among the many causes of physical urticaria.

u. pigmentosa A form of urticaria characterized by persistent, pigmented maculopapular lesions that urticate when stroked (Darier's sign). It typically occurs in childhood. Biopsy reveals infiltration by mast cells.

pressure u. Urticaria that is produced by pressure perpendicular to the surface of the skin. The persistent red swelling appears after a delay of 1 to 4 hr.

solar u. Urticaria occurring in certain individuals following exposure to sunlight.

urticarial (ŭr″tĭ-kā′rē-ăl) [L. *urtica,* nettle] Pert. to urticaria.

urticate (ŭr′tĭ-kāt) **1.** To produce urticaria. **2.** Marked by the appearance of wheals.

urushiol (ū-roo′shē-ŏl″) [Japanese *urushi,* lac, + L. *oleum,* oil] The principal toxic irritant substance of plants such as poison ivy, which produces characteristic severe dermatitis on contact.

USAEC *U.S. Atomic Energy Commission.*

USAN *United States Adopted Names* (for drugs).

USAN and the USP Dictionary of Drug Names A dictionary of nonproprietary names, brand names, code designations, and Chemical Abstracts Service registry numbers for drugs.

USDA *United States Department of Agriculture*.

usenet A world-wide collection of user-submitted notes or messages on various subjects that are posted to servers on the internet.

Usher's syndrome (ŭsh′ĕrz) [Charles Howard Usher, Brit. ophthalmologist, 1865–1942] An autosomal recessive disorder marked by a combination of congenital sensorineural deafness and retinitis pigmentosa that results in a gradual loss of vision. One variant of the syndrome also interferes with normal balance. SEE: *retinitis pigmentosa*.

USP, U.S. Phar. *United States Pharmacopeia.*

U.S.P.H.S. *United States Public Health Service.*

USP-PRN *United States Pharmacopeia–Practitioners' Reporting Network.*

USP unit Any unit specified in the U.S. Pharmacopeia.

ustilaginism (ŭs-tĭl-ăj′ĭn-ĭzm) [L. *ustulatus,* scorched, + Gr. *-ismos,* condition] Poisoning resulting from eating corn infected with smut fungus, *Ustilago maydis.*

Ustilago (ŭs-tĭl-ā′gō) A mold parasite of plants, commonly called smut, which renders grains unfit to eat.

uta (ū′tă) American leishmaniasis.

Utah Elbow (ū′tah) A myoelectric prosthesis that uses an electrode and microprocessors to control both the elbow and the terminal device. The system is also designed to permit a natural elbow swing during walking.

ut dict L. *ut dictum,* as directed.

utend L. *utendus,* to be used.

uter- SEE: *utero-*.

uteralgia (ū″tĕr-ăl′jē-ă) [L. *uterus,* womb, + Gr. *algos,* pain] Uterine pain.

uterectomy (ū″tĕr-ĕk′tō-mē) [″ + Gr. *ektome,* excision] Hysterectomy.

uterine (ū′tĕr-ĭn, -īn) [L. *uterinus*] Pert. to the uterus.

uterine artery Doppler velocimetry SEE: *Doppler echocardiography*.

uterine tube Fallopian tube.

utero-, uter- Combining forms meaning *uterus.* SEE: *hystero-; metro-*.

uteroabdominal (ū″tĕr-ō-ăb-dŏm′ĭ-năl) [L. *uterus,* womb, + *abdomen,* belly] Pert. to both the uterus and abdomen.

uterocele (ū-tĕr′ō-sēl) [″ + Gr. *kele,* tumor, swelling] Hernia containing the uterus.

uterocervical (ū″tĕr-ō-sĕr′vĭ-kăl) [″ + *cervix,* neck] Rel. to the uterus and cervix.

uterocystostomy (ū″tĕr-ō-sĭs-tŏs′tō-mē) [″ + Gr. *kystis,* bladder, + *stoma,* mouth] The formation of a passage between the uterine cervix and the bladder.

uterofixation (ū″tĕr-ō-fĭks-ā′shŭn) [″ + *fixatio,* a fixing] Fixation of a displaced uterus.

uterography (ū″tĕr-ŏg′ră-fē) [″ + Gr. *graphein,* to write] Hysterogram.

uterolith (ū′tĕr-ō-lĭth) [″ + Gr. *lithos,* stone] A uterine stone.

uterometer (ū″tĕr-ŏm′ĕt-er) [″ + Gr. *metron,* measure] Hysterometer.

uteroovarian (ū″tĕr-ō-ō-vā′rē-ăn) [″ + LL. *ovarium,* ovary] Rel. to the uterus and ovary.

uteropexia, uteropexy (ū″tĕr-ō-pĕks′ē-ă, ū′tĕr-ō-pĕks″ē) [″ + Gr. *pexis,* fixation] Fixation of the uterus to the abdominal wall.

uteroplacental (ū″tĕr-ō-plă-sĕn′tăl) [″ +

placenta, a flat cake] Rel. to the placenta and uterus.

uteroplasty (ū″tĕr-ō-plăs′tē) [″ + Gr. *plassein,* to form] Plastic surgery of the uterus. SYN: *metroplasty*.

uterorectal (ū″tĕr-ō-rĕk′tăl) Concerning the uterus and rectum.

uterosacral (ū″tĕr-ō-sā′krăl) [″ + *sacralis,* pert. to the sacrum] Rel. to the uterus and sacrum.

uterosalpingography (ū″tĕr-ō-săl-pĭng-ŏg′ră-fē) [″ + Gr. *salpinx,* tube, + *graphein,* to write] Radiography of the uterus and fallopian tubes after the introduction of a contrast medium. SYN: *hysterosalpingography*.

uterotomy (ū-tĕr-ŏt′ō-mē) Incision of the uterus.

uterotractor (ū″tĕr-ō-trăk′tor) [″ + *tractor,* drawer] An instrument for applying traction to the cervix uteri.

uterotubal (ū″tĕr-ō-tū′băl) [″ + *tuba,* tube] Relating to the uterus and oviducts.

uterovaginal (ū″tĕr-ō-văj′ĭ-năl) [″ + *vagina,* sheath] Rel. to the uterus and vagina.

uteroventral (ū″tĕr-ō-vĕn′trăl) Uteroabdominal.

uterovesical (ū″tĕr-ō-vĕs′ĭ-kăl) [″ + *vesica,* bladder] Rel. to the uterus and bladder.

uterus (ū′tĕr-ŭs) [L.] A reproductive organ for containing and nourishing the embryo and fetus from the time the fertilized egg is implanted to the time the fetus is born. SYN: *womb*. SEE: illus.; *genitalia, female* for illus.

UTERUS
Uterus and its ligaments seen laparoscopically ×1/3)

ANATOMY: The uterus is a muscular, hollow, pear-shaped organ situated in the midpelvis between the sacrum and the pubic symphysis. Before child-bearing, it is about 3 in. (7.5 cm) long, 2 in. (5 cm) wide, and 1 in. (2.5 cm) thick. Its upper surface is covered by peritoneum called the perimetrium, and it is supported by the pelvic diaphragm supplemented by the two broad ligaments, two round ligaments, and two uterosacral ligaments. It is usually anteflexed, or tilted forward, over the top of the urinary bladder. The upper portion of the uterus, between the openings of the fallopian tubes, is the fundus; the large central portion is the body; and the narrow lower end is the cervix, which projects into the vagina. The cavity of the uterus is widest in the fundus. The canal of the cervix is narrow, opens into the uterine cavity at the internal os, and into the vagina at the external os.

The wall of the uterus consists of the outer perimetrium, middle myometrium, and inner endometrium. The perimetrium is the visceral peritoneum that covers the uterus, except for the portion that rests on the bladder and the vaginal part of the cervix. The thick myometrium is smooth muscle that contracts for labor and delivery. The endometrium is the vascular lining that can become the placenta for nourishment of the embryo-fetus; it is thin before puberty; grows and is shed cyclically during childbearing years, and degenerates after menopause. The uterine and ovarian arteries supply blood to the uterus.

POSITIONS: *Anteflexion:* The uterus bends forward. *Anteversion:* The fundus is displaced forward toward the pubis, while the cervix is tilted up toward the sacrum. *Retroflexion:* The uterus bends backward at the junction of the body and the cervix. *Retroversion:* The uterus inclines backward with retention of the normal curve; this position is the opposite of anteversion. SEE: *hysterectomy; pregnancy*.

u. acollis A uterus without a cervix.

u. arcuatus A uterus with a depressed arched fundus.

u. bicornis A uterus in which the fundus is divided into two parts.

u. biforis A uterus in which the external os is divided into two parts by a septum.

u. bilocularis A uterus in which the cavity is divided into two parts by a partition.

bipartite u. A uterus in which the body is partially divided by a median septum.

cancer of u. A malignant neoplasm of the uterus, suggested by size, intermittent bleeding, purulent discharge, and detected by vaginal or Papanicolaou smear, or cervical or endometrial biopsy. Cancer may produce sterility, abortion, hemorrhage, or sepsis. SEE: *the Bethesda System; cancer cervical intraepithelial neoplasia*.

u. cordiformis A heart-shaped uterus.

u. didelphys Double uterus.

u. duplex A double uterus resulting from failure of union of müllerian ducts.

fetal u. A uterus that is retarded in development and possesses an extremely long cervical canal.

fibroids of u. Uterine fibroma.

gravid u. A pregnant uterus.

u. masculinus The prostatic utricle.

u. parvicollis A normal uterus with a disproportionately small vaginal portion.

prolapse of u. A condition in which a defective pelvic floor allows the uterus or part of it to protrude out of the vagina. In first-degree uterine prolapse, the cervix uteri reaches down to the vaginal introitus. In second-degree uterine prolapse, it protrudes out from the vagina. In third-degree uterine prolapse, the entire uterus lies outside of the vagina. SYN: *descensus uteri*. SEE: *procidentia*.

ETIOLOGY: This condition may be congenital or acquired; most often, however, it is acquired. The etiological factors are congenital weakness of the uterine supports and injury to the pelvic floor or uterine supports during childbirth.

SYMPTOMS: The condition is most often seen following instrumental deliveries or when the patient has been allowed to bear down during labor before the cervix is fully dilated. Frequently associated with this is a prolapse of the anterior and posterior vaginal walls, as seen in cystocele and rectocele. In the early stages, there are dragging sensations in the lower abdomen, back pain while standing and on exertion, a sensation of weight and bearing down in the perineum, and frequency of urination and incontinence of urine in cases associated with cystocele. In the later stages, a protrusion or swelling at the vulva is noticed on standing or straining, and leukorrhea is present. In procidentia, there is frequently pain on walking, an inability to urinate unless the mass is reduced, and cystitis.

TREATMENT: The treatment depends on the age of the patient, the degree of prolapse, and the associated pathology. Abdominal surgery with fixation of the uterus is required if the prolapse is complete.

pubescent u. An adult uterus that resembles that of a prepubertal female.

rupture of u. in pregnancy SEE: under *rupture; Nursing Diagnoses Appendix.*

subinvolution of u. The lack of involution of the uterus following childbirth, manifested by a large uterus (greater than 100 g) and a continuation of lochia rubra beyond the usual time. It is caused usually by puerperal infection, overdistention of the uterus by multiple pregnancy or polyhydramnios, lack of lactation, malposition of the uterus, and retained secundines. Involution is aided by the certainty that the placenta is intact at the time of delivery and the use of ecbolics to cause uterine contraction.

tumors of u. Uterine neoplasia, which may cause sterility or abortion or obstruct labor; they may become infected or twisted on their attachments. SEE: *cancer of uterus; endometrioma; uterine fibroma*.

u. unicornis A uterus possessing only one lateral half and usually having only one uterine tube. About 20% to 30% of women who have this structural abnormality also experience repeated spontaneous abortion during early pregnancy.

utilization review Evaluation of the necessity, quality, effectiveness, or efficiency of medical services, procedures, and facilities. In regard to a hospital, the review includes appropriateness of admission, services ordered and provided, length of stay, and discharge practices.

utricle (ū′trĭk’l) [L. *utriculus,* a little bag] **1.** Any small sac. **2.** The larger of two sacs of the membranous labyrinth in the vestibule of the inner ear. It communicates with the semicircular ducts, the saccule, and the endolymphatic duct, all of which are filled with endolymph. In its wall is the macula utriculi, a sensory area with hair cells that respond to movement of otoliths as the position of the head changes. SYN: *utriculus*.

prostatic u. A small blind pouch of the urethra extending into the substance of the prostate gland. It is a remnant of the embryonic müllerian duct. SYN: *utriculus masculinus; utriculus prostaticus; uterus masculinus*.

u. of urethra The prostatic vesicle of the male.

u. of vestibule The vestibular cavity connecting with the semicircular canals.

utricular (ū-trĭk′ū-lăr) [L. *utriculus,* a little bag] **1.** Pert. to the utricle. **2.** Like a bladder.

utriculitis (ū-trĭk-ū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of the utricle, that of either the vestibule or the prostate.

utriculoplasty (ū-trĭk′ū-lō-plăs″tē) [″ + Gr. *plassein,* to form] Surgical reduction of the size of the uterus by excision of a longitudinal wedge-shaped section.

utriculosaccular (ū-trĭk″ū-lō-săk′ū-lăr) [″ + *sacculus,* a small bag] Pert. to the utricle and saccule of the labyrinth.

utriculus (ū-trĭk′ū-lŭs) [L., a little bag] Utricle.

u. masculinus Prostatic utricle.

u. prostaticus Prostatic utricle.

uva-ursi An evergreen perennial shrub, *Arctostaphylos uva-ursi* (family Ericaceae)—commonly known as bearberry—whose dried leaves are used as a urinary antiseptic and diuretic. There have been few clinical trials on its effectiveness.

uvea (ū′vē-ă) [L. *uva,* grape] The highly

vascular middle layer of the eyeball, immediately beneath the sclera. It consists of the iris, ciliary body, and choroid, and forms the pigmented layer.

uveal (ū′vē-ăl) Pert. to the middle layer of the eye, or uvea.

uveitic (ū-vē-ĭt′ĭk) [″ + Gr. *itis,* inflammation] Marked by or pert. to uveitis.

uveitis (ū-vē-ī′tĭs) A nonspecific term for any intraocular inflammatory disorder. The uveal tract structures—iris, ciliary body, and choroid—are usually involved, but other nonuveal parts of the eye, including the retina and cornea, may be involved.

Uveitis that is not associated with known infections or that is associated with diseases of unknown cause is termed endogenous uveitis. This is thought to be due to an autoimmune phenomenon.

TREATMENT: Corticosteroids and other immunosuppressive agents, including cyclosporine, are used in treating some causes of uveitis, but their use may make some types of uveitus worse.

Short-acting cycloplegic agents such as hematropine, scopolamine, or cyclopentolate are used during therapy to prevent inflammatory adhesions (posterior synechiae) between the iris and lens.

diffuse u. Panuveitis.

intermediate u. Pars planitis.

sympathetic u. Severe, bilateral uveitis that starts as inflammation of the uveal tract of one eye resulting from a puncture wound. The injured eye is termed the "exciting eye." SEE: *sympathetic ophthalmia*.

TREATMENT: High-dose corticosteroids are often effective.

uveoparotitis (ū″vē-ō-păr-ō-tī′tĭs) [″ + Gr. *para,* beside, + *ous,* ear, + *itis,* inflammation] Inflammation of the parotid gland and uveitis.

uveoplasty (ū′vē-ō-plăs″tē) [″ + Gr. *plassein,* to form] Reparative operation of the uvea.

uveoscleritis (ū″vē-ō-sklĕr-ī′tĭs) Inflammation of the sclera in which the infection has spread from the uvea.

uviform (ū′vĭ-form) [″ + *forma,* form] Shaped like a grape.

uviofast (ū′vē-ō-făst) Uvioresistant.

uviol (ū′vē-ŏl) Glass that is unusually transparent to ultraviolet rays.

uvioresistant (ū″vē-ō-rē-zĭs′tănt) Resistant to the effects of ultraviolet radiation. SYN: *uviofast*.

uviosensitive (ū″vē-ō-sĕn′sĭ-tĭv) Sensitive to the effects of ultraviolet radiation.

uvula (ū′vū-lă) [L. *uvula,* a little grape] **1.** The free edge of the soft palate that hangs at the back of the throat above the root of the tongue; it is made of muscle, connective tissue, and mucous membrane. **2.** Any small projection.

u. of cerebellum A small lobule of the cerebellum lying on the inferior surface of the inferior vermis, anterior to the pyramis.

u. fissa A cleft uvula.

u. vermis A small, triangular elevation on the vermis of the cerebellum of the brain.

u. vesicae A median projection of mucous membrane of the urinary bladder located immediately anterior to the orifice of the urethra.

uvular (ū′vū-lăr) [L. *uvula,* little grape] Pert. to the uvula.

uvularis (ū-vū-lā′rĭs) [L.] The azygos uvulae muscle.

uvulectomy (ū″vū-lĕk′tō-mē) [″ + Gr. *ektome,* excision] Surgical removal of the uvula.

uvulitis (ū″vū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of the uvula.

uvulopalatopharyngoplasty (ū″vū-lō-păl″ă-tō-fă-rĭn″gō-plăs′tē) ABBR: UPPP. Plastic surgery of the oropharynx in which redundant soft palate, uvula, pillars, fauces, and sometimes posterior pharyngeal wall mucosa are removed. The procedure may be done by using laser therapy. It is usually done to correct intractable snoring or sleep apnea. SEE: *sleep disorder; snore*.

uvuloptosis (ū″vū-lŏp-tō′sĭs) [″ + Gr. *ptosis,* a dropping] A relaxed and pendulous condition of the palate. SYN: *uvulaptosis*.

U wave In the electrocardiogram, a low-amplitude deflection that follows the T wave. It is exaggerated in hypokalemia and with digitalis use, and negative in ventricular hypertrophy. SEE: *QRST complex; electrocardiogram*.

V

V **1.** *Vibrio; vision; visual acuity.* **2.** Symbol for the element vanadium.

V̇ **1.** Symbol for gas flow. **2.** Symbol for ventilation.

v L. *vena,* vein; *volt.*

vaccina (văk-sī′nă) Vaccinia.

vaccinal (văk′sĭn-ăl) Rel. to vaccine or to vaccination.

vaccinate (văk′sĭn-āt) [L. *vaccinus,* pert. to cows] To inoculate with vaccine to produce immunity against disease.

vaccination (văk″sĭ-nā′shŭn) [L. *vaccinus,* pert. to cows] **1.** Inoculation with any vaccine or toxoid to establish resistance to a specific infectious disease. SEE: *immunization*. **2.** A scar left on the skin by inoculation of a vaccine.

antitumor v. The injection of tumor-associated antigens (e.g., from melanomas or other solid tumors) into cancer patients in an attempt to raise a long-lasting and effective immune response against the tumor. The tumor antigen is often presented to the vaccinee in the presence of dendritic cells, in order to improve the presentation of the antigen and heighten the immune response. SYN: *antitumor vaccine; tumor vaccine*.

catch-up v. The immunization of unvaccinated children at the most convenient times (e.g., on the first day of school) rather than at the optimal time for antibody production. Because many children miss vaccines at regularly scheduled times, catch-up immunization offers unvaccinated children, their families, and the communities in which they live a second opportunity for disease prevention and control.

mass v. The use of vaccines during an outbreak of a communicable disease in an attempt to prevent an epidemic. In the U.S. mass vaccinations are sometimes carried out in schools and hospitals during meningitis or hepatitis epidemics.

vaccine (văk′sēn, văk-sēn′) [L. *vaccinus,* pert. to cows] **1.** An infectious liquid that Edward Jenner (Brit. physician, 1749–1823) derived from cowpox lesions, and used to prevent and attenuate smallpox in humans. **2.** Any suspension containing antigenic molecules derived from a microorganism, given to stimulate an immune response to an infectious disease. Vaccines may be made from weakened or killed microorganisms; inactivated toxins; toxoids derived from microorganisms; or immunologically active surface markers extracted or copied from microorganisms. They can be given intramuscularly, subcutaneously, intradermally, orally, or intranasally; as single agents; or in combinations. SEE: *Recommended Immunization Schedules Appendix*.

The ideal vaccine should be effective, well-tolerated, easy and inexpensive to manufacture, easy to administer, and easy to store. In practice, vaccine side effects such as fevers, muscle aches, and injection site pain are common but generally mild. Adverse reactions to vaccines that should be reported include anaphylaxis, shock, seizures, active infection, and death. SEE: *immunization*.

CAUTION: Because vaccines may cause side effects, all persons who receive them should carefully review federally mandated Vaccine Information Sheets before they are immunized.

adsorbed anthrax v. A cell-free, aluminum-hydroxide-adsorbed vaccine, administered to raise protective antibodies against *Bacillus anthracis*. *Bacillus anthracis* causes anthrax and has been used in biological warfare.

antitumor v. Antitumor vaccination.

autogenous v. Bacterial vaccine prepared from lesions of the individual to be inoculated. SYN: *homologous vaccine*.

bacterial v. A suspension of killed or attenuated bacteria; used for injection into the body to produce active immunity to the same organism.

BCG v. Bacille Calmette-Guérin vaccine, a preparation of a dried, living but attenuated culture of *Mycobacterium bovis.* In areas with a high incidence of tuberculosis (TB), it is used to provide passive TB immunity to infants and to protect adults who have an unavoidable risk of TB infection. The vaccine cannot be used in pregnant women or in immunosuppressed individuals. A disadvantage of the use of the vaccine is that it produces hypersensitivity to TB skin tests, making them unreliable for several years. The vaccine can also be used in cancer chemotherapy, e.g., in the treatment of multiple myeloma and cancer of the colon. It is also used as a bladder wash in patients with carcinoma of the bladder. SEE: *bacille Calmette-Guérin*.

cholera v. A vaccine prepared from killed *Vibrio cholerae.* It is effective for only a few months.

diphtheria v. A vaccination against

Corynebacterium diphtheriae. SEE: *DTaP v.*

DNA v. A vaccine made by genetic engineering in which the gene that codes for an antigen is inserted into a bacterial plasmid and then injected into the host. Once inside the host, it uses the nuclear machinery of the host cell to manufacture and express the antigen. Unlike other vaccines, DNA vaccines may have the potential to induce cellular as well as humoral immune responses.

DPT v. An obsolete combination of diphtheria and tetanus toxoids and killed pertussis bacilli that is no longer given in pediatric immunizations because of the superiority of DTaP, a vaccine that contains only acellular pertussis.

DTaP v. A preparation of diphtheria and tetanus toxoids and acellular pertussis proteins. It is used to immunize children against all three infections.

edible v. A genetically manipulated food containing organisms or related antigens that may provide active immunity against infection. Edible vaccines against many microorganisms are being developed, with the goal of using them to vaccinate children in non-industrialized countries where there are obstacles to the use of traditional injectable vaccines.

v. extraimmunization The giving of excessive or repetitive doses of vaccines to children or adults, usually because of incomplete or inaccurate recordkeeping.

Haemophilus influenzae type b v. ABBR: HIB. A vaccine created by combining purified polysaccharide antigen from the *H. influenzae* bacteria and a carrier protein. It reduces the risks of childhood epiglottitis, meningitis, and other diseases caused by *H. influenzae*.

hepatitis B v. A vaccine prepared from hepatitis B protein antigen produced by genetically engineered yeast.

heterogeneous v. A vaccine made from some source other than the patient's own tissues or cells; the opposite of autogenous vaccine.

heterologous v. A vaccine derived from an organism different from the organism against which the vaccine is used.

homologous v. Autogenous v.

human diploid cell rabies v. ABBR: HDCV. An inactivated virus vaccine prepared from fixed rabies virus grown in human diploid cell tissue culture.

inactivated poliovirus v. An injectable vaccine made from three types of inactivated polioviruses. SYN: *Salk vaccine*.

influenza virus v. A polyvalent vaccine containing either inactivated or live attenuated antigenic variants of the influenza virus (types A and B either individually or combined) for annual usage. It prevents epidemic disease and the morbidity and mortality caused by influenza virus, esp. in the aged and persons with chronic illnesses. The vaccine is reformulated each year to match the strains of influenza present in the population.

killed v. A vaccine prepared from dead microorganisms. This type of vaccine is used to prevent disease caused by highly virulent microbes.

live attenuated influenza v. ABBR: LAIV. A live virus vaccine made with influenza viruses adapted to replicate in the nose, sinuses, and pharynx but not in the lower respiratory tract. LAIV is typically administered by nasal inhalation rather than by intramuscular injection.

live attenuated measles (rubeola) virus v. A vaccine prepared from live strains of the measles virus. It is the preferred form except in patients who have one of the following: lymphoma, leukemia, or other generalized malignancy; radiation therapy; pregnancy; active tuberculosis; egg sensitivity; prolonged treatment with drugs that suppress the immune response (i.e., corticosteroids or antimetabolites); or administration of gamma globulin, blood, or plasma. Those persons should be given immune globulin immediately following exposure.

live measles and mumps virus v. A standardized vaccine containing attenuated measles and mumps viruses.

live measles and rubella virus v. A standardized vaccine containing attenuated measles and rubella viruses.

live measles, mumps, and rubella virus v. ABBR: MMR vaccine. A standardized vaccine containing attenuated measles, mumps, and rubella viruses.

live measles virus v. A standardized attenuated virus vaccine for use in immunizing against measles.

live oral poliovirus v. A vaccine prepared from three types of live attenuated polioviruses. In 1999, an advisory panel to the Centers for Disease Control and Prevention recommended that its routine use be discontinued. Because it contains a live, although weakened virus, it has caused 8 to 10 cases of polio each year. This risk is no longer acceptable now that the polio epidemic has been eliminated in the U.S. SYN: *Sabin vaccine*.

live rubella virus v. An attenuated virus vaccine used to prevent rubella (German measles). All nonpregnant susceptible women of childbearing age should be provided with this vaccine to prevent fetal infection and the congenital rubella syndrome (i.e., possible fetal

death, prematurity, impaired hearing, cataract, mental retardation, and other serious conditions). SEE: *rubella*.

Lyme disease v. A vaccine that uses as an antigen either the outer surface protein (OspA) of *Borrelia burgdorferi* (the spirochete that causes Lyme disease) or the decorin protein of the same microbe. Lyme vaccine is available in the U.S. for veterinary use only.

meningococcal v. A vaccine prepared from bacterial polysaccharides from certain types of meningococci. Meningococcal polysaccharide vaccines A, C, Y, and W135 are available for preventing diseases caused by those serogroups. A vaccine for meningococcal serogroup B is not available. SEE: *meningitis, acute meningococcal*.

mumps v. A live attenuated vaccine used to prevent mumps. Its use should be governed by the same restrictions listed for live attenuated measles virus vaccine.

peptide v. A vaccine that stimulates antibody production against specific amino acid sequences, e.g., those expressed on the surface of pathogens or cancer cells.

pertussis v. A vaccine against *Bordetella pertussis*. SEE: *DTaP v.*

plague v. A vaccine made either from a crude fraction of killed plague bacilli, *Yersinia pestis,* or synthetically from recombinant proteins. It is rarely used, except in a laboratory or for field workers in areas where plague is endemic.

polyvalent v. A vaccine produced from cultures of a number of strains of the same species.

polyvalent pneumococcal v. A vaccine that contains 23 of the known 83 pneumococcal capsular polysaccharides, and induces immunity for 3 to 5 years. This vaccine is estimated to protect against 90% of the pneumococcal types that produce serious disease in patients over 2 years of age. Children at high risk can be vaccinated at age 6 months and reinoculated at age 2 years. The vaccine is particularly indicated in high-risk groups such as persons with sickle cell diseases, chronic debilitating disease, immunological defects, and the elderly.

PATIENT CARE: The importance of vaccinating older adults, children, and other patients at risk for pneumococcal disease is continually rising, as *Streptococcus pneumoniae* becomes more and more resistant to antibiotics.

pneumococcal 7-valent conjugate v. A pneumococcal vaccine used for active immunization of infants and toddlers. The vaccine contains antigens from 7 capsular serotypes of *Streptococcus pneumoniae*.

rabies v. A vaccine prepared from killed rabies virus used for pre-exposure immunization for persons at high occupational risk. Following a bite by a rabid animal, both the vaccine and rabies immune globulin, containing preformed antibodies, are given. SEE: *human diploid cell rabies v.; rabies*.

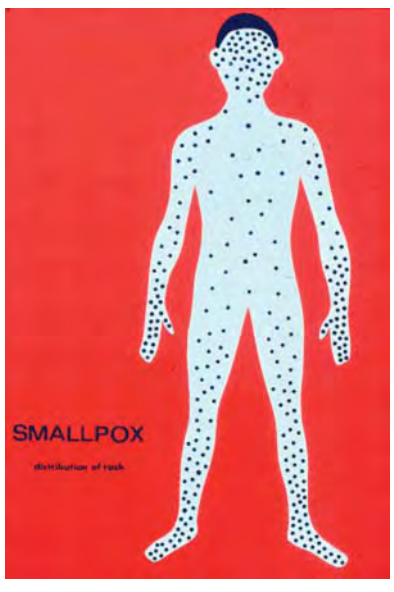
reassortant v. A vaccine made by combining antigens from several viruses or from several strains of the same virus.

Sabin v. Live oral poliovirus v. SEE: *poliomyelitis*.

Salk v. SEE: *Salk vaccine*.

sensitized v. A vaccine prepared from bacteria treated with their specific immune serum.

smallpox v. A vaccine used to provide immunity against smallpox, one of the deadliest infections in the history of humanity. The vaccine is made from live vaccinia virus (not from the smallpox virus). Similarities between the two viruses make the vaccine about 95% effective in preventing smallpox in those people exposed to the virus. Smallpox vaccine was not used for many years because smallpox had been eradicated worldwide. However, concerns over the use of smallpox as a biological weapon have resulted in vaccination of persons at high risk (e.g., public health workers, health care response teams, members of the armed services). The general public is not being vaccinated. The CDC recommends that persons who could be exposed to the monkeypox virus should also be vaccinated against smallpox. SEE: illus.



SMALLPOX
Centripetal distribution.

tetanus v. A vaccine against *Clostridium tetani*. SEE: *DTaP v.*

tumor v. Antitumor vaccination.

typhoid v. One of two forms of vaccine against typhoid fever. Attenuated (weakened) live virus is used for an oral vaccine taken in four doses by adults and children over age 6; it provides protection for 5 years. This vaccine should not be given to persons taking antimicrobial drugs or to those with AIDS. A parenteral type of the vaccine, made from the capsular polysaccharide of *Salmonella typhi,* given to children at least 6 months old, requires two doses 4 weeks apart, is effective 55% to 75% of the time, and lasts 3 years.

typhus v. A sterile suspension of the killed rickettsial organism of a strain or strains of epidemic typhus rickettsiae.

varicella (chickenpox) v. A chickenpox vaccine prepared from attenuated virus. SEE: *chickenpox; herpes zoster*.

yellow fever v. A vaccine made from a live attenuated strain of yellow fever that protects against this tropical, mosquito-borne, viral hemorrhagic fever.

vaccine adverse event reporting system ABBR: VAERS. A national surveillance system for monitoring undesirable reactions to administered vaccines.

vaccine therapy Injection of bacteria or their products to produce active immunization against a disease. SYN: *opsonic therapy*.

vaccinia (văk-sĭn′ē-ă) [L. *vaccinus,* pert. to cows] A contagious disease of cattle, produced in humans by inoculation with cowpox virus to confer immunity against smallpox. Papules form about the third day after vaccination, changing to umbilicated vesicles about the fifth day, and at the end of the first week becoming umbilicated pustules surrounded by red areolae. They dry and form scabs, which fall off about the second week, leaving a white pitted depression. SYN: *cowpox; vaccina*. SEE: *vaccination; varicella; variola*.

v. necrosum Spreading necrosis at the site of a smallpox vaccination; may be accompanied by similar necrotic areas elsewhere on the body. SYN: *progressive vaccinia*.

progressive v. v. necrosum.

vaccinia immune globulin An immune globulin containing vaccinia-specific antibodies. It is used for dermal complications of vaccination for smallpox (i.e., severe eczema vaccinatum and progressive vaccinia). An intravenous formulation (IV-VIG) is now being produced and tested.

vacciniform (văk-sĭn′ĭ-form) [L. *vaccinus,* pert. to cows, + *forma,* shape] Of the nature of vaccinia or cowpox.

Vaccinium macrocarpon (văk-sĭn′ē-ŭm măk″rō-kăr′pŭn) [L., blueberry + Gr. *makros,* long + *karpos,* fruit] The scientific name for cranberry.

vaccinogenous (văk″sĭn-ŏj′ĕn-ŭs) [L. *vaccinus,* pert. to cows, + Gr. *gennan,* to produce] Producing vaccine or pert. to its production.

vaccinostyle (văk-sĭn′ō-stīl) A pointed stylus used in vaccination.

VACTERL association An acronym for a rare congenital syndrome of birth defects, specifically vertebral abnormalities, anal atresia, cardiac structural anomalies, tracheoesophageal fistula, esophageal atresia, renal maldevelopment, and limb aplasias.

vacuolar (văk′ū-ō-lăr) [L. *vacuum,* empty] Pert. to or possessing vacuoles.

vacuolated (văk′ū-ō-lāt″ĕd) Possessing or containing vacuoles.

vacuolation (văk″ū-ō-lā′shŭn) Formation of vacuoles. SYN: *vacuolization*.

vacuole (văk′ū-ōl) [L. *vacuum,* empty] A membrane-bound cell organelle, which may contain water, secretions, enzymes, or the remains of ingested material.

autophagic v. A vacuole that contains recognizable fragments of the ribosomes or mitochondria.

contractile v. A cavity filled with fluid in the cytoplasm of a protozoan. The cavity is emptied by sudden contraction of its walls.

heterophagous v. A vacuole that contains substances that come from outside the cell.

plasmocrine v. A vacuole present in the cytoplasm of a secretory cell that is filled with crystalloid material.

rhagiocrine v. A vacuole present in the cytoplasm of a secretory cell that is filled with colloid material.

vacuolization (văk″ū-ō-lĭ-zā′shŭn) [L. *vacuum,* empty] Vacuolation.

vacuum (văk′ū-ŭm) [L., empty] A space exhausted of its air content.

vacuum aspiration Evacuation of the uterine contents by means of a curet or catheter attached to a suction apparatus. The procedure is performed before the 12th week of gestation.

vacuum extractor A device for applying traction to the fetus during delivery by using a suction cup attached to the fetal head. Its use may be hazardous except in the hands of experts.

vacuum tube A vessel of insulating material (usually glass) that is sealed and has a vacuum sufficiently high to permit the free flow of electrons between the electrodes that extend into the tube from the outside. In England, it is called a vacuum valve.

vagabond's disease Discoloration of the skin caused by exposure and scratching owing to the presence of lice. SEE: *pediculosis corporis*.

vagal (vā′găl) [L. *vagus,* wandering] Pert. to the vagus nerve.

vagal attack Vasodepressor syncope.

vagal maneuver Any physical action that increases parasympathetic tone and decreases the conduction of the electrical impulses of the heart. Vagal maneuvers may be used as first-line interventions in the evaluation or management of supraventricular tachycardias. Examples include bearing down or straining; massaging the carotid sinus; coughing; gagging; or immersing the face or neck in ice water. SEE: *Valsalva's maneuver*.

vagi (vā′gī) Pl. of vagus.

vagin- SEE: *vagino-*.

vagina (vă-jī′nă) *pl.* **vaginae, vaginas** [L., sheath] A musculomembranous tube that forms the passageway between the cervix uteri and the vulva. SEE: illus.

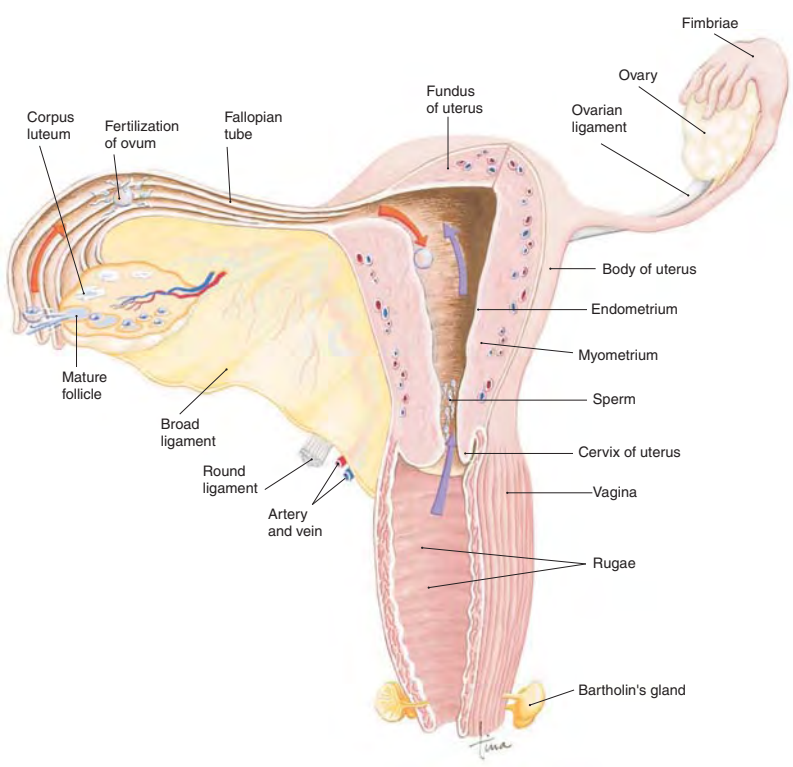
ANATOMY: In the uppermost part, the cervix divides the vagina into four small vaulted cavities, called fornices: two lateral, the anterior, and the posterior. The bladder and urethra are adjacent to the anterior wall of the vagina, and the rectum is behind the posterior wall. The cavity of the vagina is a potential space; the walls are usually in contact with each other. Close to the cervix uteri the walls form a horizontal crescent shape, at the midpoint an H shape, and close to the vulva the shape of a vertical slit. The vaginal mucosa is stratified squamous epithelium that is very resistant to bacterial colonization. This lining is in folds called rugae, and the connective tissue external to it also permits stretching. The blood supply of the vagina is furnished from the inferior vesical, inferior hemorrhoidal, and uterine arteries. Except for the area close to the entrance, the vaginal tissue and mucosa contain few, if any, sensory nerve endings. The vagina is a passage for the insertion of the penis, for the reception of semen, and for the discharge of the menstrual flow. It also serves as the birth canal.

artificial v. A vagina constructed by plastic surgery for a patient whose vagina was removed for treatment of carcinoma or one who has congenital absence of the vagina.

bulb of v. The small erectile body on each side of the vestibule of the vagina. SEE: *vestibule of vagina*.

v. fibrosa tendinis A fibrous sheath surrounding a tendon that usually confines it to an osseous groove.

foreign bodies in v. Objects that en-



VAGINA AND OTHER FEMALE ORGANS

ter the vagina accidentally or are inserted deliberately. A great variety of foreign bodies may be present in the vagina, esp. in children. Some foreign bodies in adults include vaginal tampons, pessaries, and contraceptive diaphragms. The treatment is to remove the foreign body. Antibiotic therapy is not usually necessary.

v. masculina Prostatic utricle.

v. mucosa tendinis A synovial sheath that develops about a tendon.

septate v. A congenital condition in which the vagina is divided longitudinally into two parts. This division may be partial or complete.

vaginal (văj′ĭn-ăl) [L. *vagina,* sheath] Pert. to the vagina or to any enveloping sheath.

vaginal birth after previous cesarean ABBR: VBAC. Vaginal childbirth subsequent to cesarean delivery of a previous pregnancy. The risk of uterine rupture is 1% to 2%.

vaginalitis (văj-ĭn-ăl-ī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of the tunica vaginalis testis.

vaginal lubricant A fluid, usually a water-soluble ointment or cream, used to reduce vaginal dryness or sexual friction. As a lubricant, petroleum jelly is of little or no value. Estrogen-containing vaginal creams reduce friction-associated discomfort related to postmenopausal atrophy. A natural and effective lubricant is human saliva.

vaginal vibrator A device used for erotic stimulation. It is usually applied to the clitoris or intravaginally.

vaginapexy (văj″ĭn-ă-pĕk′sē) [″ + Gr. *pexis,* fixation] Repair of a relaxed and prolapsed vagina. SYN: *colpopexy*.

vaginate (văj′ĭn-āt) [L. *vaginatus*] Forming or enclosed in a sheath.

vaginectomy (văj-ĭn-ĕk′tō-mē) [L. *vagina,* sheath, + Gr. *ektome,* excision] **1.** Vaginalectomy. **2.** Excision of the vagina or a part of it.

vaginismus (văj″ĭn-ĭz′mŭs) [L.] Painful spasm of the vagina from contraction of the muscles surrounding it, a condition that may interfere with coitus. SEE: *Nursing Diagnoses Appendix.*

PATIENT CARE: Patients with vaginismus need factual information and emotional support. Information about sexual concerns, practices, and responses should be geared specifically to the problem or question posed by the patient. Correcting myths and misinformation and teaching the woman about the range of normal sexual responses can be helpful. The patient should understand that the goal of instrumental dilator therapy is to gain control of the spasm. Specific information should be given about practicing relaxation techniques before dilator sessions, when one should switch from one size dilator to another, and what to do if problems occur. It helps to address a patient's emotional concerns to provide psychological support. The woman should be helped to attain security and comfort in her own sexual responses. Additional suggestions for patients may include advice about extending foreplay to increase vaginal relaxation and lubrication, as well as alternatives to dilator therapy, such as the intravaginal use of progressively heavier tampons.

vaginitis (văj-ĭn-ī′tĭs) [L. *vagina,* sheath, + Gr. *itis,* inflammation] **1.** Inflammation of a sheath. **2.** Inflammation of the vagina. SYN: *colpitis*. SEE: *sexually transmitted disease; Nursing Diagnoses Appendix.*

ETIOLOGY: This condition may be caused by microorganisms such as gonococci, chlamydiae, *Gardnerella vaginalis,* staphylococci, streptococci, spirochetes; viruses; irritation from fungal chemicals in douching; infection (candidiasis) caused by *Candida albicans;* protozoal infection (*Trichomonas vaginalis*); neoplasms of the cervix or vagina; or irritation from foreign bodies (e.g., a pessary or a retained tampon). Other rare causes are parasitic illnesses, or, in malnourished women, pellagra.

SYMPTOMS: The patient experiences vaginal discharge, sometimes malodorous and occasionally stained with blood; irritation or itching; increased urinary frequency; and pain during urination on examination. The vaginal mucous membrane is reddened and there may be superficial ulceration.

TREATMENT: Specific therapy is given as indicated. Improved perineal hygiene is emphasized by instructing in the proper method of cleaning the anus after a bowel movement, the proper use of menstrual protection materials, and the necessity of drying the vulva following urination.

PATIENT CARE: Aseptic technique is used to collect specimens. The health care provider supports the patient throughout the procedures, explaining each procedure and forewarning the patient of possible discomfort. If vaginitis is due to a sexually transmitted disease, the sexual partner should receive treatment together with the patient to prevent reinfection. Certain sexually transmitted vaginal infections are reported to local Public Health Service officials along with the patient's known sexual contacts.

v. adhaesiva Inflammation of the vagina causing adhesions between its walls.

atrophic v. Postmenopausal thinning and dryness of the vaginal epithelium related to decreased estrogen lev-

els. SYN: *postmenopausal vaginitis; senile vaginitis*.

Symptoms include burning and pain during intercourse. Estrogen replacement therapy, hormone replacement therapy, or application of topical estrogen restores the integrity of the vaginal epithelium and supporting tissues and relieves symptoms.

candidal v. A yeast infection caused by *Candida albicans*.

Symptoms include a thick, curdlike adherent discharge; itching; dysuria; and dyspareunia. The vulva and vagina are bright red. History usually reveals one or more risk factors: use of oral contraceptives or broad-spectrum antibiotics; immune defects; diabetes mellitus; pregnancy; or frequent douching. Diagnosis is established by the presence of hyphae and buds on a wet smear treated with 10% potassium hydroxide solution, and/or of growth of culture on Nickerson's or Sabouraud's media. Oral ketoconazole or topical applications of an imidazole (e.g., miconazole, clotrimazole, butoconazole, or ketoconazole), or both, promptly relieve symptoms and produce negative culture results after 3 to 7 days of therapy. In 20% to 30% of patients, however, infection recurs 1 month later. SYN: *moniliasis*.

chlamydial v. The most common sexually transmitted vaginal infection in the U.S., caused by an obligate intracellular parasite, *Chlamydia trachomatis*. Chlamydial infection is also a major cause of pelvic inflammatory disease, tubal occlusion, infertility, ectopic pregnancy, nongonococcal urethritis, and ophthalmia neonatorum. Asymptomatic chlamydial infection has been implicated in the development of preterm labor and birth in high-risk women. Symptoms include a thin or purulent vaginal discharge, dysuria, and lower abdominal pain. Diagnosis is established by testing for specific monoclonal antibodies. Doxycycline is the drug of choice, except during pregnancy (it damages fetal bone and tooth formation). During pregnancy the infection is treated with erythromycin. SEE: *Chlamydia*.

diphtheritic v. Vaginitis with membranous exudate caused by infection with *Corynebacterium diphtheriae*.

emphysematous v. Vaginitis with gas-bubble formation in connective tissues.

granular v. Vaginitis with cellular infiltration and enlargement of papillae.

nonspecific v. A rare condition in which no particular factor or etiological agent is identifiable; a contact-related allergic response may be involved. The inflammation usually resolves spontaneously. Treatments include topical creams and ointments. SEE: *bacterial vaginosis*.

DIAGNOSIS: The diagnosis is established when clinical symptoms of vaginitis are present, but no organisms are found in laboratory specimens.

postmenopausal v. Atrophic v.

senile v. Atrophic v.

v. testis Inflammation of the tunica vaginalis of the testis.

Trichomonas vaginalis v. An inflammation of the vagina caused by flagellate protozoa that infect the vagina, urethra, and Skene's ducts. Although the individual inflammatory response can include severe vulvar irritation and burning, dysuria, dyspareunia, and profuse, thin, "frothy," yellow-green to gray discharge, nearly 50% of infected women are asymptomatic. Sixty percent of the sexual partners of infected women share the infection. On inspection, the vulva may appear reddened and edematous. About 10% of infected women exhibit characteristic "strawberry patches" in the upper vagina and upper cervix. Diagnosis is based on seeing the highly motile organism with three to five flagella in a saline wet smear. Oral metronidazole is the organism-specific treatment. SEE: *Trichomonas*.

vagino-, vagin- [L. *vagina,* sheath] Combining forms meaning *vagina*.

vaginoabdominal (văj″ĭn-ō-ăb-dŏm′ĭn-ăl) [L. *vagina,* sheath, + *abdominalis,* abdominal] Rel. to the vagina and abdomen.

vaginocele (văj′ĭn-ō-sēl) [″ + Gr. *kele,* tumor, swelling] Vaginal hernia. SYN: *colpocele*.

vaginodynia (văj″ĭn-ō-dĭn′ē-ă) [″ + Gr. *odyne,* pain] Pain in the vagina.

vaginogenic (văj″ĭn-ō-jĕn′ĭk) [″ + Gr. *gennan,* to produce] Developed from or originating in the vagina.

vaginogram (văj′ĭn-ō-grăm) [″ + gramma, something written] A radiograph of the vagina.

vaginography (văj-ĭn-ŏg′ră-fē) [″ + Gr. *graphein,* to write] Radiography of the vagina. This technique is useful in diagnosing ureterovaginal fistula.

vaginolabial (văj″ĭn-ō-lā′bē-ăl) [″ + *labium,* lip] Rel. to the vagina and labia.

vaginometer (văj-ĭn-ŏm′ĕ-tĕr) [″ + Gr. *metron,* measure] A device for measuring the length and expansion of the vagina.

vaginomycosis (văj″ĭn-ō-mī-kō′sĭs) [″ + Gr. *mykes,* fungus, + *osis,* condition] A fungus infection (mycosis) of the vagina.

vaginopathy (văj″ĭ-nŏp′ă-thē) [″ + Gr. *pathos,* disease, suffering] Any disease of the vagina.

vaginoperineal (văj″ĭn-ō-pĕr-ĭ-nē′ăl) [″ + Gr. *perinaion,* perineum] Rel. to the vagina and perineum.

vaginoperineoplasty (văj″ĭn-ō-pĕr″ĭ-nē′ō-

plăs″tē) Plastic surgery involving the vagina and perineum.

vaginoperineorrhaphy (văj″ĭn-ō-pĕr″ĭ-nē-or′ăf-ē) [″ + ″ + *rhaphe,* seam, ridge] Repair of a laceration involving both the perineum and vagina. SYN: *colpoperineorrhaphy*.

vaginoperineotomy (văj″ĭn-ō-pĕr″ĭn-ē-ŏt′ō-mē) [″ + ″ + *tome,* incision] Surgical incision of the vagina and perineum; usually done to facilitate childbirth. SEE: *episiotomy*.

vaginoperitoneal (văj″ĭn-ō-pĕr″ĭ-tō-nē′ăl) Rel. to the vagina and peritoneum.

vaginoplasty (vă-jī′nō-plăs″tē) [″ + Gr. *plassein,* to form] Plastic surgery on the vagina.

vaginoscope (văj′ĭn-ō-skōp) [″ + Gr. *skopein,* to examine] An instrument for inspection of the vagina. This may be a speculum or an optical instrument.

vaginoscopy (văj″ĭn-ŏs′kō-pē) Visual examination of the vagina.

vaginosis, bacterial (văj″ĭ-nō′sĭs) Inflammation of the vagina and upper genital tract caused by *Gardnerella vaginalis.* The diagnosis is confirmed by characteristic "fishy" odor produced when the vaginal discharge is mixed with 10% potassium hydroxide. A wet smear reveals vaginal epithelial cells that are heavily stippled with bacteria, called clue cells. Oral metronidazole or oral clindamycin is prescribed; intravaginal metronidazole gel and intravaginal clindamycin cream also are effective. Asymptomatic bacterial vaginosis during pregnancy has been implicated in causing preterm labor. During pregnancy, treatment with metronidazole plus erythromycin reduces the rate of preterm delivery in at-risk women. SEE: *Gardnerella vaginalis vaginitis*.

vaginotomy (văj″ĭ-nŏt′ō-mē) [″ + Gr. *tome,* incision] Incision of the vagina.

vaginovesical (văj″ĭ-nō-vĕs′ĭ-kăl) [″ + *vesica,* bladder] Rel. to the vagina and bladder. SYN: *vesicovaginal*.

vaginovulvar (văj″ĭn-ō-vŭl′văr) [″ + *vulva,* covering] Vulvovaginal.

vagitis (vă-jī′tĭs) [L. *vagus,* wandering, + Gr. *itis,* inflammation] Inflammation of the vagal nerve.

vagitus (vă-jī′tŭs) [L. *vagire,* to squall] The first cry of a newborn.

v. uterinus The crying of a fetus while still in the uterus.

v. vaginalis The cry of an infant with its head still in the vagina.

vagolysis (vā-gŏl′ĭ-sĭs) [L. *vagus,* wandering, + Gr. *lysis,* dissolution] Surgical destruction of the vagus nerve.

vagolytic (vā″gō-lĭt′ĭk) **1.** Concerning vagolysis. **2.** An agent, surgical or chemical, that prevents function of the vagus nerve.

vagomimetic (vā″gō-mĭ-mĕt′ĭk) [″ + Gr. *mimetikos,* imitating] Resembling action caused by stimulation of the vagus nerve.

vagosympathetic (vā″gō-sĭm-pă-thĕt′ĭk) [″ + Gr. *sympathetikos,* suffering with] The cervical sympathetic and vagus nerves considered together.

vagotomy (vā-gŏt′ō-mē) [″ + Gr. *tome,* incision] Section of the vagus nerve.

medical v. Administration of drugs to prevent function of the vagus nerve.

vagotonia (vā″gō-tō′nē-ă) [″ + Gr. *tonos,* tension] Hyperirritability of the parasympathetic nervous system. SEE: *sympatheticotonia*. **vagotonic,** *adj.*

vagotropic (vā″gō-trŏp′ĭk) [″ + Gr. *tropos,* a turning] Acting on the vagus nerve.

vagotropism (vā-gŏt′rō-pĭzm) [″ + ″ + *-ismos,* condition] Affinity for the vagus nerve, as a drug.

vagovagal (vā″gō-vā′găl) Concerning reflex activity mediated entirely through the vagus nerve (i.e., via efferent and afferent impulses transmitted through the vagus nerve).

vagrant (vā′grănt) [L. *vagrans*] **1.** Wandering from place to place without a fixed home. **2.** A homeless person who wanders from place to place.

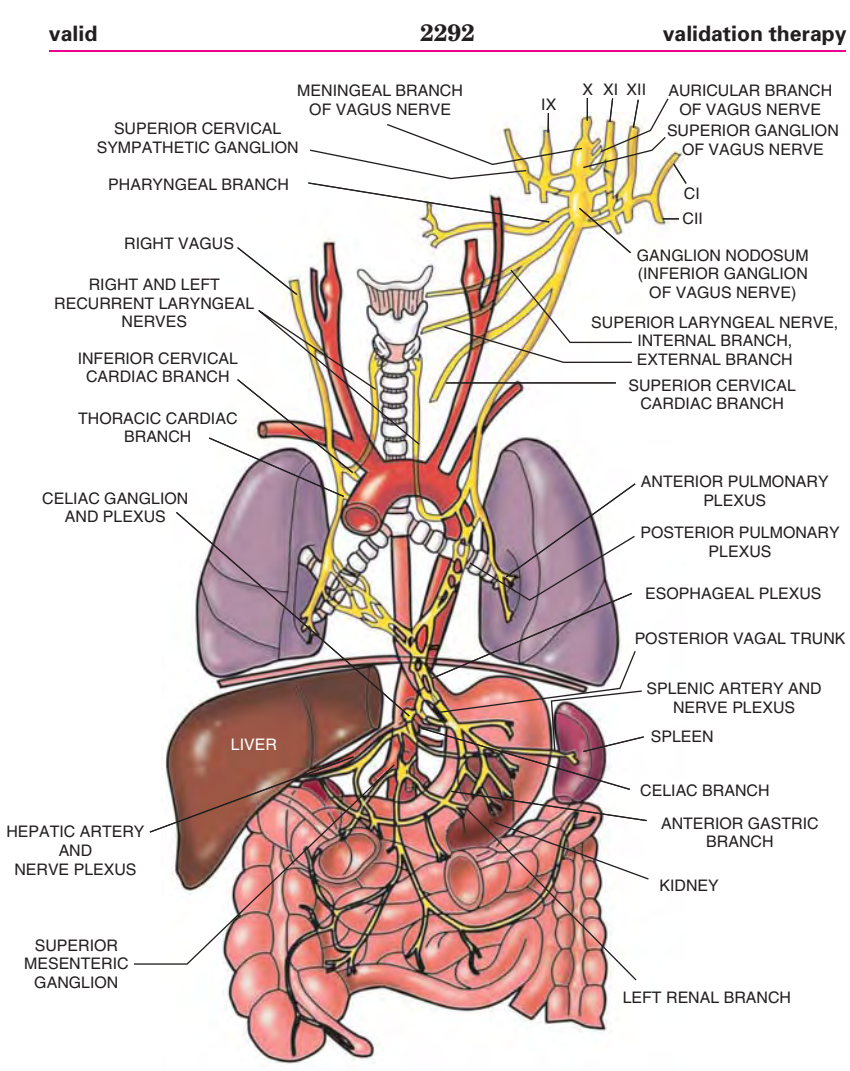
vagus (vā′gŭs) *pl.* **vagi** [L., wandering] The 10th cranial nerve; a mixed nerve that arises from the medulla and has branches to many organs. Its impulses slow the heart rate, constrict the bronchioles, and increase peristalsis and digestive secretions. SEE: illus.; *cranial nerve*.

valence, valency (vā′lĕns, -lĕn-sē) [L. *valens,* powerful] **1.** The property of an atom or group of atoms causing them to combine in definite proportion with other atoms or groups of atoms. Valency may be as high as 8 and is determined by the number of electrons in the outer orbit of the atom. **2.** The degree of the combining power or replacing power of an atom or group of atoms, the hydrogen atom being the unit of comparison. The number indicates how many atoms of hydrogen can unite with one atom of another element.

Valentin's ganglion (văl′ĕn-tēnz) [Gabriel Gustav Valentin, Ger. physician, 1810–1883] A small ganglion at the junction of the middle and posterior branches of the superior dental plexus.

valerian (vă-lĕhr′ē-an) A perennial herb, *Valeriana officinalis,* used as a sedative and sleep aid. The drug acts by inhibiting the breakdown of gamma-aminobutyric acid in the brain. Persons habituated to the use of this agent may occasionally develop tachycardia, delirium, and other symptoms of dependence and withdrawal.

valgus (văl′gŭs) [L., bowlegged] Bent or turned outward, used esp. of deformities in which the most distal anatomical part is bent outward and away from the



VAGUS NERVE (10TH CRANIAL)

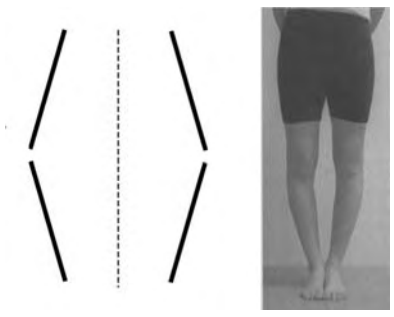
midline of the body, as talipes valgus or hallux valgus. SEE: illus.; *knock-knee; varus*.

valid (văl′ĭd) [L. *validus,* strong] Producing the desired effect; correct.

validate (văl′ĭ-dāt) To ensure that the item in question is valid and correct.

validation, consensual The process of testing thoughts, emotions, and behaviors with other human beings. The desired outcome is acknowledgment of similar viewpoints and feelings.

validation therapy A communication technique used for patients with moderate to late dementia in which the caregiver makes statements to the patient that demonstrate respect for the patient's feelings and beliefs. This method helps prevent argumentative and agi-



VALGUS

tated behavior. In some cases, the caregiver may need to agree with the patient's statements, even though they are not true or real. It is used when reality orientation is not successful.

validity (vă-lĭd′ĭ-tē) **1.** The degree to which data or results of a study are correct or true. **2.** The extent to which a situation as observed reflects the true situation.

valine (văl′ēn, vā′lēn) An amino acid, $C_5H_{11}NO_2$, derived from digestion of proteins. It is essential in the diet, esp. for normal growth in infants.

valinemia (văl″ĭ-nē′mē-ă) Increased valine in the blood.

vallate (văl′āt) [L. *vallatus,* walled] Having a rim around a depression.

vallecula (văl-lĕk′ū-lă) [L., a depression] A depression or crevice.

v. cerebelli A deep fissure on the inferior surface of the cerebellum. SYN: *valley of cerebellum*.

v. epiglottica A depression lying lateral to the median epiglottic fold and separating it from the pharyngoepiglottic fold.

v. ovata A depression in the liver in which rests the gallbladder.

v. sylvii A depression marking the beginning of the fissure of Sylvius in the brain.

v. unguis A fold of skin in which the proximal and lateral edges of the nails are embedded.

valley of cerebellum Vallecula cerebelli.

valley fever Coccidioidomycosis.

vallum unguis (văl′ŭm ŭng′gwĭs) The fold of skin overlapping the nail.

Valsalva's maneuver (văl-săl′văz) [Antonio Maria Valsalva, It. anatomist, 1666–1723] An attempt to forcibly exhale with the glottis, nose, and mouth closed. This maneuver causes increased intrathoracic pressure, slowing of the pulse, decreased return of blood to the heart, and increased venous pressure. If the eustachian tubes are not obstructed, the pressure on the tympanic membranes also will be increased. When this maneuver is done with just the glottis closed, only intrathoracic pressure will increase. This maneuver may be helpful in converting supraventricular tachycardias to normal sinus rhythm or in clearing ears that have become blocked during a descent from a high altitude. SEE: *Müller's maneuver; Toynbee maneuver*.

Valsalva's sinuses Three dilatations in the wall of the ascending aorta behind the three flaps of the aortic semilunar valve.

valsartan (văl-săr′tăn) An angiotensin II receptor antagonist and hypertensive, administered orally to manage hypertension. SYN: *Diovan*.

value (văl′ū) [ME. from L. *valere,* to be of value] **1.** The amount of a specific substance or the magnitude of an entity. **2.** Something that is cherished or held dear.

valvate (văl′vāt) [L. *valva,* leaf of a folding door] Valvular.

valve (vălv) [L. *valva,* leaf of a folding door] Any one of various membranous structures in a hollow organ or passage that temporarily close to permit the flow of fluid in one direction only.

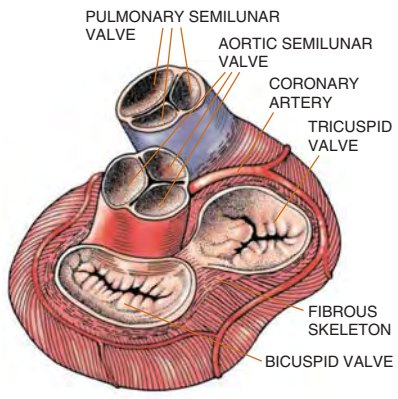
aortic v. The valve at the junction of the left ventricle and the ascending aorta; composed of three segments (semilunar cusps). The aortic valve prevents regurgitation. SEE: *cardiac v.* for illus.

Béraud's v. SEE: *Béraud's valve*.

bicuspid v. Mitral valve.

Bjork-Shiley heart v. A synthetic artificial heart valve that is no longer commercially available but remains implanted in thousands of patients. The valve has been known to fracture at its struts during use, which results in death in the majority of cases.

cardiac v. One of the four valves that prevent the backflow of blood as it passes into, through, and out of the heart. In order of the entry of the venous blood into the right atrium, they are right atrioventricular, pulmonary, left atrioventricular, and aortic. SEE: illus.



CARDIAC VALVES
Superior view with atria removed

coronary v. The coronary sinus valve at the entrance of the coronary sinus into the right atrium. SYN: *thebesian valve*.

Houston's v. SEE: *Houston's valve*.

ileocecal v. A projection of two membranous folds of the ileum of the small intestine into the cecum of the colon. It prevents backup of fecal material into the small intestine. SYN: *valve of Varolius; valvula coli*.

left atrioventricular v. Mitral valve.

mitral v. SEE: *mitral valve*.

nasal v. The site of greatest obstruc-

tion to airflow through the nasal passages. It extends from the bony cave near the piriform aperture into part of the cartilaginous vestibule of the nose.

prosthetic heart v. A substitute valve used to replace a diseased valve. There are two main types of prostheses: those made from biological tissues (such as from the heart valves of animals, esp. pigs) and those made from biocompatible materials, such as metals or polymers.

pulmonary v. The valve at the junction of the right ventricle and pulmonary artery. It is composed of three semilunar cusps and prevents regurgitation of blood from the pulmonary artery to the right ventricle. SEE: *cardiac v.* for illus.

pyloric v. The prominent circular membranous fold at the pyloric orifice of the stomach. SYN: *valvula pylori*.

reducing v. A device used to reduce the pressure of gas that has been compressed in a cylinder.

right atrioventricular v. Tricuspid v.

semilunar v. The type of valve separating the heart and aorta and the heart and pulmonary artery. SYN: *valvula semilunaris*. SEE: *cardiac v.* for illus.

thebesian v. Coronary v.

tricuspid v. The valve that closes the orifice between the right cardiac atrium and right ventricle during ventricular systole. SYN: *right atrioventricular valve; valvula tricuspidalis*. SEE: *cardiac v.* for illus.

v. of Varolius Ileocecal v.

valvectomy Surgical excision of a valve, esp. a heart valve. SEE: *valvuloplasty*.

valvotomy (văl-vŏt′ō-mē) [″ + Gr. *tome,* incision] Valvulotomy.

mitral balloon v. Expansion of a balloon in the orifice of a mitral valve as a means of treating mitral stenosis, instead of mitral valve replacement or commissurotomy. SYN: *valvuloplasty*.

valvula (văl′vū-lă) *pl.* **valvulae** [L., a small fold] A valve, specifically a small valve.

v. bicuspidalis Bicuspid valve.

v. coli Ileocecal valve.

v. pylori Pyloric valve.

v. semilunaris Semilunar valve.

v. tricuspidalis Tricuspid valve.

valvulae (văl′vū-lē) Pl. of valvula.

v. conniventes Circular plica.

valvular (văl′vū-lăr) [L. *valvula,* a small fold] Rel. to or having one or more valves. SYN: *valvate*.

valvulitis (văl″vū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of a valve, esp. a cardiac valve.

valvuloplasty (văl′vū-lō-plăs″tē) Plastic or restorative surgery on a valve, esp. a cardiac valve.

percutaneous balloon v. The percutaneous insertion of one or more balloons across a stenotic heart valve. Inflating the balloons decreases the constriction. This technique has been used to treat mitral and/or pulmonic stenosis.

valvulotome (văl′vū-lō-tōm) [″ + Gr. *tome,* incision] An instrument for incising a valve.

valvulotomy (văl″vū-lŏt′ō-mē) The process of cutting through a valve. SYN: *valvotomy*.

vanadium (vă-nā′dē-ŭm) [*Vanadis,* a Scandinavian goddess] SYMB: V. A light gray metallic element; atomic weight, 50.941; atomic number, 23.

vanadiumism (vă-nā′dē-ŭm-ĭzm) Toxicity due to chronic exposure to vanadium. The consequences include bronchitis, pneumonitis, conjunctivitis, and anemia.

van Buren's disease (văn bū′rĕnz) [William Holme van Buren, U.S. surgeon, 1819–1883] Induration of the corpora cavernosa of the penis. SYN: *Peyronie's disease*.

van der Hoeve's syndrome (văn′dér hōvz″) [Jan van der Hoeve, Dutch ophthalmologist, 1878–1952] Conductive deafness caused by otosclerosis-like changes in the temporal bone. Blue sclerae and osteogenesis imperfecta are also present.

van der Waals forces (văn′dĕr-wŏlz) [Johannes D. van der Waals, Dutch physicist, 1837–1923] The definite but weak forces of attraction between the nuclei of atoms of compounds. These forces do not result from ionic attraction, hydrogen bonding, or sharing of electrons, but rather from the motion of electrons in atoms and molecules.

Van der Woude's syndrome An autosomal dominant syndrome marked by cleft lip, palate, or both, paramedian pits of the lower lip, hypodontia, and missing second premolar teeth. SYN: *cleft lip–cleft palate syndrome; lip-pit syndrome*.

vanilla (vă-nĭl′ă) [Sp. *vainilla,* little sheath] Any one of a group of tropical orchids. The cured seed pods of *Vanilla planifolia* contain an aromatic substance, also called vanilla, that is used for flavoring.

vanillin (vă-nĭl′ĭn) A crystalline compound found in vanilla pods or produced synthetically; used for flavoring foods and in pharmaceuticals.

vanillism (vă-nĭl′ĭzm) Irritation of the skin, mucous membranes, and conjunctiva sometimes experienced by workers handling raw vanilla. It is caused by a mite.

vanillylmandelic acid ABBR: VMA. 3-methoxy-4-hydroxymandelic acid. Metabolic product of catecholamines representing approx. 90% of the metabolites of catecholamines epinephrine and norepinephrine. VMA's are secreted in the urine. Persons with pheo-

chromocytoma produce excess amounts of catecholamines; thus, increased amounts of VMA are present in their urine.

van't Hoff's rule (vănt-hŏfz′) [Jacobus Henricus van't Hoff, Dutch chemist, 1852–1911] The rule that the speed of chemical reactions is doubled, at least, for each 10°C rise in temperature.

vapor (vā′por) [L., steam] **1.** The gaseous state of any substance. **2.** A medicinal substance for administration by inhalation.

vaporization (vā″por-ī-zā′shŭn) [L. *vapor,* steam] **1.** The conversion of a liquid or solid into vapor. **2.** Therapeutic use of a vapor.

laser v. The resection of tissue by converting it to gas with laser energy.

vaporize (vā′por-īz) To change a material to a vapor form.

vaporizer (vā′por-ī″zer) A device for converting liquids into a vapor spray.

vaporous (vā′por-ŭs) [L. *vapor,* steam] Consisting of, pert. to, or producing vapors.

Vaquez's disease (vă-kāz′) [Louis Henri Vaquez, Fr. physician, 1860–1936] Polycythemia vera.

variability (văr″ē-ă-bĭl′ĭ-tē) The ability and tendency to change.

baseline v. Fluctations in the fetal heart rate, recorded by the electronic monitor, that reflect the status of the fetal autonomic nervous system. Absence of short-term variability (beat-to-beat changes) is a sign of fetal compromise. Long-term variability (wavelike undulations) occurs normally three to five times per minute. Increased long-term variability is common during fetal sleep but may reflect prematurity, congenital abnormalities such as anencephaly, or fetal response to drugs.

genetic v. **1.** The range of minor alterations present in a genome, such as the number of diverse alleles of a specific gene that are found as a result of small mutations in the DNA of a species. **2.** The expression of those diverse genes in living organisms and their impact on health or disease.

heart rate v. ABBR: HRV. Spontaneous fluctuations above and below the mean heart rate. A reduced HRV is associated with an increased incidence of total mortality and cardiac events in post-myocardial infarction patients, as well as in apparently healthy individuals, esp. older persons.

variable (vā′rē-ă-b'l) [L. *variare,* to vary] **1.** Any changing, measurable thing. In statistics, it is often possible to measure and graph the relationship of one variable to another (e.g., height and weight in the growing child). **2.** Changing in form, structure, behavior, or physiology.

dependent v. In epidemiology and research design, the condition or disease under study or the response part of a dose-response curve. In a study measuring smoking and heart disease, for example, heart disease would be the dependent variable.

independent v. In epidemiology and research, the agent that incites a response; the stimulus (e.g., the dose part of a dose-response curve). In the smoking and heart disease study cited in the entry called *dependent variable,* smoking would be the independent variable.

variance (văr′ē-ăns) [L. *variare,* to vary] A statistical index of the degree to which measurements in a data set are different from each other or deviate from the mean; the square of the standard deviation.

variant (văr′ē-ănt) That which is different from the characteristics of the other organisms or entities in a particular classification, esp. a disease, species, or physical appearance.

variate (vā′rē-āt) Variable (2).

variation (vā″rē-ā′shŭn) Differences between individuals of a certain species or class.

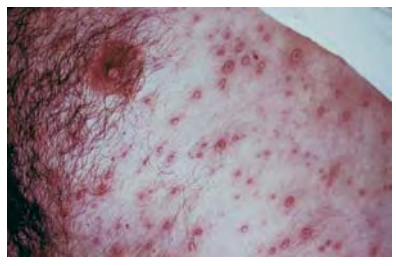
continuous v. Variation in which the difference between successive groups or individuals is quite small.

meristic v. Variation in number as opposed to kind.

varication (văr″ĭ-kā′shŭn) **1.** Formation of a varix. **2.** The condition of a varicosity.

variced (văr′ĭ-sĕd) Concerning a varix.

varicella (văr″ĭ-sĕl′ă) [L., a tiny spot] An acute infectious disease, usually seen in children under age 15, caused by varicella-zoster virus. Its hallmark is a rash, described clinically as having a "dewdrop on a rose petal" pattern, scattered in clusters ("crops") over the trunk, face, scalp, upper extremities, and sometimes the thighs. It is transmitted mainly by respiratory droplets that contain infectious particles; direct contact with a lesion and contaminated equipment also can spread the virus. Reactivation of the virus in adults causes shingles. SYN: *chickenpox*. SEE: illus; *herpes zoster; varicella-zoster immune globulin*.



VARICELLA (CHICKENPOX)

SYMPTOMS: After an incubation pe-

riod of 2 to 3 weeks (usually 13 to 17 days), patients develop fever, malaise, anorexia, and lymphadenopathy, followed by the appearance of an extremely pruritic (itchy) rash that starts flat and, over time, becomes a small blister on a red base, and then eventually forms crusted scabs. All three stages of the rash may be present on the body at one time. Varicella may be transmitted to others until all lesions are crusted over.

Occasionally, for example, when it occurs in adults or immunosuppressed children, chickenpox is complicated by superimposed bacterial pneumonia, encephalitis, or thrombocytopenia. Immunization with varicella vaccine provided during infancy is designed to prevent these complications.

ETIOLOGY: Chickenpox may strike individuals of any age who have not been previously been exposed to the virus. Epidemics are most frequent in winter and spring in temperate climates.

DIFFERENTIAL DIAGNOSIS: Impetigo, dermatitis herpetiformis, herpes zoster, and furunculosis may occasionally need to be distinguished from varicella, although usually the difference is obvious.

COMPLICATIONS: Secondary infections may occur, caused by scratching, which may result in abscess formation; at times, development of erysipelas or even septicemia may result. Occasionally, lesions in the vicinity of the larynx may cause edema of the glottis and threaten the life of the patient. Encephalitis is a rare complication. Varicella may be fatal in children with leukemia or children who are taking adrenocorticosteroids.

PREVENTION: Administration of varicella-zoster immune globulin (VZIg) within 72 hr of exposure will prevent clinical varicella in susceptible, healthy children. The following conditions should alert one to the possible need for use of VZIg: immunocompromised children; newborns of mothers who develop varicella in the period 5 days before to 48 hr after delivery; postnatal exposure of newborns (esp. those who are premature) to varicella; healthy adults who are susceptible to varicella and who have been exposed; pregnant women who have no history of having had varicella and who have had significant exposure. The use of VZIg in pregnant women will not prevent fetal infection or congenital varicella syndrome. Live attenuated vaccine is now available for general use.

CAUTION: Because severe illness and death have resulted from varicella in children being treated with corticosteroids, these children should avoid exposure to varicella.

TREATMENT: Otherwise healthy affected children are treated with diphenhydramine or hydroxyzine to reduce itch and acetaminophen to reduce fever. Children at increased risk for complications and immunosuppressed adults are given varicella-zoster immune globulin as prophylaxis after exposure. If varicella infection develops in immunosuppressed persons or pregnant women in the third trimester, intravenous acyclovir is administered. Immunization with varicella vaccination is recommended for those children who have not had chickenpox and have not previously received the immunization. SEE: *Standard and Universal Precautions Appendix.*

v. gangrenosa Varicella in which necrosis occurs around the vesicles, resulting in gangrenous ulceration.

varicella-zoster immune globulin ABBR: VZIg. An immune globulin obtained from the blood of healthy persons found to have high antibody titers to varicella-zoster. SEE: *varicella*.

varicelliform (văr″ĭ-sĕl′ĭ-form) Resembling varicella. SYN: *varicelloid*.

varicelloid (văr″ĭ-sĕl′oyd) [″ + Gr. *eidos,* form, shape] Varicelliform.

varices (văr′ĭ-sēz) [L.] Pl. of varix.

variciform (văr-ĭs′ĭ-form) [L. *varix,* twisted vein, + *forma,* shape] Varicose.

varicoblepharon (văr″ĭ-kō-blĕf′ă-rŏn) [″ + Gr. *blepharon,* eyelid] Varicose tumor of the eyelid.

varicocele (văr′ĭ-kō-sēl) [″ + Gr. *kele,* tumor, swelling] Enlargement of the veins of the spermatic cord, commonly occurring above the left testicle. Varicoceles, present in more than 10% of males, are usually identified during adolescence. Male infertility has been linked to varicoceles, but a definitive causal relation has not been established. SYN: *varicole*.

SYMPTOMS: There is a dull ache along the cord and a slight dragging sensation in the groin. On examination, the vessels on the affected side of the scrotum are full, feel like a bundle of worms, and are sometimes purplish.

TREATMENT: Most varicoceles are asymptomatic and are followed conservatively. When they cause intolerable symptoms, or when they are found during the evaluation of men with infertility, they may be surgically repaired. However, there is no firm evidence that varicocele repair improves male fertility.

ovarian v. Varicosity of the veins of the ovarian or pampiniform plexus of the broad ligament.

utero-ovarian v. Varicosity of the

veins of the ovarian (pampiniform) plexus and the uterine plexus of the broad ligament.

varicocelectomy (văr″ĭ-kō-sē-lĕk′tō-mē) [L. *varix,* twisted vein, + Gr. *kele,* tumor, swelling, + *ektome,* excision] Excision of a portion of the scrotal sac with ligation of the dilated veins to relieve varicocele.

varicography (văr″ĭ-kŏg′ră-fē) [″ + Gr. *graphein,* to write] Radiography of varicose veins after the injection of a contrast medium.

varicoid (văr′ĭ-koyd) [″ + Gr. *eidos,* form, shape] Resembling a varix.

varicole (văr′ĭ-kōl) Varicocele.

varicomphalus (văr″ĭ-kŏm′fă-lŭs) [″ + Gr. *omphalos,* navel] Varicose tumor of the navel.

varicophlebitis (văr″ĭ-kō-flē-bī′tĭs) [″ + Gr. *phleps,* vein, + *itis,* inflammation] Phlebitis combined with varicose veins.

varicose (văr′ĭ-kōs) [L. *varicosus,* full of dilated veins] Pert. to varices; distended, swollen, knotted veins. SYN: *variciform*.

varicose vein An enlarged, dilated superficial vein. This condition may occur in almost any part of the body but is most common in the lower extremities and in the esophagus. SEE: *Nursing Diagnoses Appendix.*

ETIOLOGY: The development of varicose veins of the legs is promoted and aggravated by pregnancy, obesity, and occupations that require prolonged standing. Esophageal varices are caused by portal hypertension that accompanies cirrhosis of the liver.

SYMPTOMS: Most varicose veins of the legs are asymptomatic, although they may be cosmetically undesirable. Esophageal varices and hemorrhoidal varices may bleed profusely. SEE: illus.

VARICOSE VEINS IN LEG

TREATMENT: In hemorrhage, elevation of the extremity and gentle but firm pressure over the wound will stop the bleeding. The patient should not be permitted to walk until the acute condition is controlled. Sclerotherapy, rubber band ligation, or octreotide may be used to control bleeding caused by hemorrhage from esophageal varices.

PATIENT CARE: The patient with lower extremity varicosities is taught to avoid anything that impedes venous return, such as wearing garters and tight girdles, crossing the legs at the knees, and prolonged sitting. After the legs have been elevated for 10 to 15 min, support hose are applied. The patient should not sit in a chair for longer than 1 hr at a time. Ambulation is encouraged for at least 5 min every hour. The patient should elevate the legs whenever possible, but no less than twice a day for 30 min each time, and should avoid prolonged standing. Signs of thrombophlebitis, a complication of varicose veins, include heat and local pain. If surgery is performed, elastic stockings or antithrombus devices are applied postoperatively and the foot of the bed is elevated above the level of the heart. Overweight patients need to lose weight. Patients with esophageal varices may be treated with oral nitrates and beta blockers and consultation with a gastroenterologist.

varicosis (văr″ĭ-kō′sĭs) [L.] Varicose condition of veins.

varicosity (văr″ĭ-kŏs′ĭ-tē) [L. *varix,* twisted vein] **1.** Condition of being varicose. **2.** Varix (1).

varicotomy (văr″ĭ-kŏt′ō-mē) [″ + Gr. *tome,* incision] Excision of a varicose vein.

varicula (văr-ĭk′ū-lă) [L., a tiny dilated vein] A small varix, esp. of the conjunctiva.

variety (vă-rī′ĕ-tē) [L., *varietas,* variety] A term used in classifying individuals in a subpopulation of a species.

variola (vă-rī′ō-lă) [L., pustule] Smallpox. **variolar** (-lăr), *adj.*

v. major Smallpox with its full-blown, classic symptoms. SYN: *variola vera*.

v. minor A mild form of smallpox with sparse rash and low-grade fever.

v. vera Variola major.

varix (vā′rĭks) *pl.* **varices** [L., twisted vein] **1.** A tortuous dilatation of a vein. SEE: *varicose vein*. **2.** Less commonly, dilatation of an artery or lymph vessel.

aneurysmal v. A direct communication between an artery and a varicose vein without an intervening sac.

arterial v. A varicosity or dilation of an artery.

chyle v. A varix of a lymphatic vessel that conveys chyle.

esophageal v. A tortuous dilatation of an esophageal vein, esp. in the distal portion. It results from any condition that causes portal hypertension, typically cirrhosis of the liver. SEE: *Müller's*

maneuver; Nursing Diagnoses Appendix.

SYMPTOMS: If an esophageal varix bursts, massive hemorrhage occurs, and the patient may die within minutes.

TREATMENT: Medical treatment includes administration of a beta blocker, such as nadolol, with a nitrate, such as isosorbide, to lower portal pressures and decrease the likelihood of variceal bleeding. Invasive therapies include the injection of sclerosing agents or rubber banding of the dilated vein.

lymphaticus v. Dilatation of a lymphatic vessel.

turbinal v. Permanent dilatation of veins of turbinate bodies.

varnish (vär′nĭsh) A solution of gums and resins in a solvent. When these are applied to a surface, the solvent evaporates and leaves a hard, more or less flexible film. In dentistry, varnishes are used to protect sensitive tooth areas such as the pulp. SYN: *cavity v.*

cavity v. Varnish.

periodontal v. A protective coating applied to the outer tooth surface to alleviate pain and promote healing after deep scaling or curettage.

varolian (vă-rō′lē-ăn) [Costanzo Varolio (Varolius), It. anatomist, 1543–1575] Rel. to the pons varolii.

varolian bend The anterior extension of the hindgut on its ventral surface in the fetus.

varus (vā′rŭs) [L.] Bent or turned inward, used esp. of deformities in which the most distal part of the anatomy is turned toward the body's midline. There are many varus conditions. In *coxa varus,* the shaft of the femur turns inward with respect to the neck of the femur. In *genu varus,* either the femur or tibia turns inward at the knee, causing a bowlegged deformity. *Talipes varus* is a clubfooted condition in which the foot turns inward and the person walks on the outer border of the foot. SEE: illus.; *valgus*.

VARUS

vas (văs) *pl.* **vasa** [L., vessel] A vessel or duct.

v. aberrans **1.** A narrow tube varying in length from 1½ to 14 in (3.8 to 35.6 cm), occasionally found connected with the lower part of the canal of the epididymis or with the commencement of the vas deferens. **2.** A vestige of the biliary ducts sometimes found in the liver.

v. afferens An afferent vessel of a lymph node.

v. afferens glomeruli The afferent arteriole that carries blood to the glomerulus of a renal corpuscle.

v. capillare A capillary blood vessel.

v. deferens The secretory duct of the testis, a continuation of the epididymis. This slim, muscular tube, approx. 18 in (45.7 cm) long, transports the sperm from each testis to the ejaculatory duct, which empties into the prostatic urethra. SYN: *ductus deferens*. SEE: illus.; *genitalia* for illus.

v. lymphaticum One of the vessels carrying the lymph.

v. prominens Blood vessel on the cochlea's accessory spiral ligament.

v. spirale A large blood vessel beneath the tunnel of Corti in the basilar membrane.

vasa (vā′să) [L. *vas,* vessel] Pl. of vas.

v. afferentia The lymphatic vessels entering a lymph node.

v. brevia Branches of the splenic artery going to the greater curvature of the stomach.

v. efferentia **1.** Lymphatics that leave a lymph node. **2.** The secretory ducts of the testis to the head of the epididymis.

v. praevia The blood vessels of the umbilical cord presenting before the fetus.

v. recta **1.** Tubules that become straight before entering the mediastinum testis. **2.** Capillary branches of the renal efferent arterioles, parallel to the loops of Henle.

v. vasorum Minute blood vessels that are distributed to the walls of the larger veins and arteries.

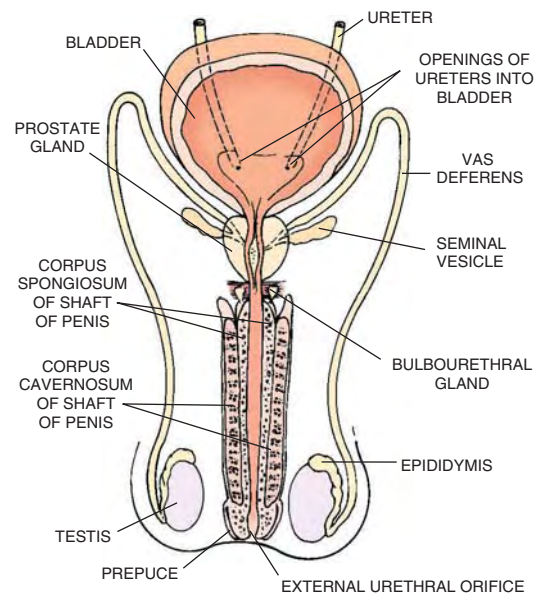
v. vorticosa Stellate veins of the choroid, carrying blood to the superior ophthalmic vein.

vasal (vā′săl) [L. *vas,* vessel] Rel. to a vas or vessel.

vasalgia (vă-săl′jē-ă) Pain in a vessel of any kind.

vascular (văs′kū-lăr) [L. *vasculum,* a small vessel] Pert. to or composed of blood vessels.

vascular endothelium The simple squamous epithelial tissue lining the blood vessels. It is a semipermeable barrier between the blood and the vascular smooth muscle, produces vasodilator chemicals, and may inhibit vasoconstrictor substances. Damage to the endothelium leads to increased production of prostaglandins and stimulates blood clotting.



VAS DEFERENS AND OTHER MALE ORGANS

vascularity (văs″kū-lăr′ĭ-tē) The state of being vascular.

vascularization (văs″kū-lăr-ī-zā′shŭn) [L. *vasculum,* a small vessel] The development of new blood vessels in a structure.

vascularize (văs′kū-lăr″īz) [L. *vasculum,* a small vessel] To become vascular by development of new blood vessels.

vascular system The blood vessels: the arteries, capillaries, and veins. The vessels carry blood to and from the heart and contribute to the regulation of blood pressure. Exchange of materials between the blood and tissues takes place in capillary networks. Pulmonary and systemic circulation are included.

vascular technologist A person skilled in obtaining and interpreting ultrasonic images from blood vessels.

vascular tuft One of the vascular processes on the chorion in the fetus at an early stage of development. SYN: *chorionic villi*.

vasculature (văs′kū-lă-tūr″) The arrangement of blood vessels in the body or any part of it, including their relationship and functions.

vasculitis (văs″kū-lī′tĭs) *pl.* **vasculitides** [″ + *itis,* inflammation] Inflammation of blood vessels. SYN: *angiitis*.

It is usually caused by deposition of antigen-antibody immune complexes or other immune-mediated events. Vasculitis due to immune complexes is seen in patients with systemic lupus erythematosus, rheumatoid arthritis, hepatitis B and C, serum sickness, and drug reactions. Vasculitis found in patients with inflammatory bowel disease, Wegener's granulomatosis, graft rejection, polyarthritis nodosa, and temporal arteritis involves other immune-mediated processes. Vasculitis often affects the renal glomeruli, joints, cerebral vessels, testes, or respiratory system.

Vasculitis can affect large, medium-sized, and small blood vessels. When it is found in small blood vessels in the skin, characteristic rashes may be seen. Vasculitis is loosely classified by the size of the vessel involved. Takayasu's and giant cell arteritis involve large arteries, including the aorta and carotids. Polyarteritis nodosa and Kawasaki disease involve medium-sized vessels, and Wegener's granulomatosis, Henoch-Schönlein purpura, and microscopic polyangiitis involve small vessels, particularly in the kidney and respiratory tract. SEE: illus; *autoimmune disease; immune complex*.

SYMPTOMS: Although fever, pain, and malaise are common, the inflammatory changes of the blood vessels are seen primarily through the signs and symptoms associated with the organ or tissues involved. Vasculitis in superficial vessels may present as painful nodules. Inflammation of the glomerular capillaries of the kidney in small vessel vasculitis may produce glomerulonephritis and decreased renal function. When blood vessels of the respiratory tract are involved, pneumonitis, sinusi-

tis, and ulceration of the nasopharynx may result. Involvement of vessels in the heart leads to coronary artery disease and aneurysms.

VASCULITIS

TREATMENT: Immunosuppressive therapy is used to treat most forms of autoimmune-mediated vasculitis.

livedoid v. A vasculitis with blood-clotting that affects small blood vessels in the skin, esp. near the feet and ankles. The cause in most cases in unknown, but it may be associated with diseases such as antiphospholipid antibody syndrome, systemic lupus, or scleroderma.

rejection v. The inflammation that occurs when antigen-antibody complexes are deposited on the walls of small blood vessels in transplanted organs. Although the transplant rejection process is dominated by T-cell–mediated activities, antibodies also may form against the histocompatibility antigens on the transplanted organ and compromise its viability. SEE: *major histocompatibility complex*.

vasculogenesis (văs″kū-lō-jĕn′ĕ-sĭs) [″ + Gr. *genesis,* generation, birth] Development of the vascular system.

vasculomotor (văs″kū-lō-mō′tor) Vasomotor.

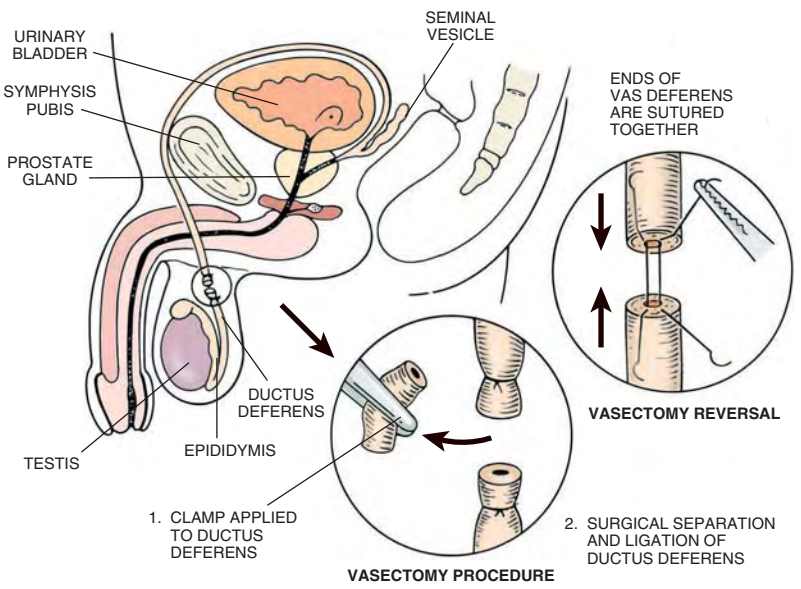
vasculopathy Any disease affecting blood vessels.

vasectomy (văs-ĕk′tō-mē) [L. *vas,* vessel, + Gr. *ektome,* excision] Removal of all or a segment of the vas deferens. Bilateral vasectomy is the most successful method of male contraception. The question of the possible increased risk of prostate cancer in individuals who have had a vasectomy has been investigated, but the findings are inconclusive. SEE: illus.

NOTE: Persons who have had this surgical procedure ejaculate in a normal manner but the ejaculate does not contain sperm. There are no anatomical or physiological reasons for sterilization by this method to alter the sex drive or libido. Nevertheless, hematomas may occur postoperatively, and granulomas in response to leakage of sperm may occur.

CAUTION: Sterility is not considered to have been achieved until two ejaculates have been found to be free of sperm. Spontaneous reanastomosis has been reported.

PATIENT CARE: Ice bags are applied after surgery to reduce swelling and to



VASECTOMY AND ITS REVERSAL

promote comfort. Sitz baths may promote comfort in the days immediately after the surgery. Surgery does not prevent sexually transmitted diseases.

vasectomy reversal Surgical procedure for the rejoining of the previously severed vas deferens. Although this procedure may be successful, the chance of success varies in published reports.

vasiform (văs′ĭ-form) [″ + *forma,* shape] Resembling a tubular structure or vas.

vasitis (vă-sī′tĭs) Inflammation of the ductus deferens of the testicle.

vaso- [L. *vas,* vessel] Combining form meaning *vessel,* as a blood vessel.

vasoactive (văs″ō-ăk′tĭv) Affecting blood vessels.

vasoactive intestinal polypeptide ABBR: VIP. A peptide present in the mucosa of the gastrointestinal tract. One of its principal actions is to inhibit gastric acid secretion. Vasoactive intestinal polypeptide is also present in nerve fibers of the female genital tract.

vasoconstriction (văs″ō-kŏn-strĭk′shŭn) A decrease in the diameter of blood vessels, which decreases blood flow and raises blood pressure.

hypoxic pulmonary v. Narrowing of the small arterioles in the alveoli in response to hypoxia.

vasoconstrictive (văs″ō-kŏn-strĭk′tĭv) [″ + *constrictus,* bound] Causing constriction of the blood vessels.

vasoconstrictor (văs″ō-kŏn-strĭk′tor) [″ + *constrictor,* a binder] **1.** Causing constriction of the blood vessels. **2.** That which constricts or narrows the caliber of blood vessels, as a drug or a nerve.

vasodepression (văs″ō-dē-prĕsh′ŭn) [″ + *depressio,* a pressing down] Vasomotor depression or collapse.

vasodepressor (văs″ō-dē-prĕs′or) [″ + *depressor,* that which presses down] **1.** Having a depressing influence on the circulation, lowering blood pressure by dilatation of blood vessels. **2.** An agent that decreases circulation.

vasodilatation (văs″ō-dīl-ă-tā′shŭn) [″ + *dilatare,* to enlarge] Dilatation of blood vessels, esp. small arteries and arterioles.

antidromic v. Vasodilatation resulting from stimulation of the dorsal root of a spinal nerve.

reflex v. Blood vessel dilation caused by stimulation of its dilator nerves or inhibition of its constrictor substance or nerves. This can be done by stimulating the sensory reflex arc.

vasodilation (văs″ō-dī-lā′shŭn) An increase in the diameter of blood vessels, which increases blood flow and lowers blood pressure.

vasodilative (văs″ō-dī′lā-tĭv) Causing dilation of blood vessels.

vasodilator (văs″ō-dī-lā′tor) [″ + *dilatare,* to enlarge] **1.** Causing relaxation of blood vessels. **2.** A nerve or drug that dilates blood vessels.

vasoepididymostomy (văs″ō-ĕp″ĭ-dĭd-ĭ-mŏs′tō-mē) [″ + Gr. *epi,* upon, + *didymos,* testicle, + *stoma,* mouth] The formation of a passage between the vas deferens and the epididymis.

vasofactive (văs″ō-făk′tĭv) [″ + *facere,* to make] Forming new blood vessels.

vasoganglion (văs″ō-găng′glē-ŏn) A dated term for a mesh or local network of blood vessels.

vasography (văs-ŏg′ră-fē) [″ + Gr. *graphein,* to write] Radiography of the blood vessels, usually after the injection of a contrast medium.

vasohypertonic (văs″ō-hī″pĕr-tŏn′ĭk) [″ + Gr. *hyper,* over, above, excessive, + *tonikos,* pert. to tension] Vasoconstrictor.

vasohypotonic (văs″ō-hī″pō-tŏn′ĭk) [″ + Gr. *hypo,* under, beneath, below, + *tonikos,* pert. to tension] Vasodilator.

vasoinhibitor (văs″ō-ĭn-hĭb′ĭ-tor) [″ + *inhibere,* to restrain] An agent that decreases the action of vasomotor nerves.

vasoinhibitory (văs″ō-ĭn-hĭb′ĭ-tor-ē) Restricting vasomotor activity.

vasoligation (văs″ō-lī-gā′shŭn) [″ + *ligare,* to bind] Ligation of a vessel, specifically the vas deferens.

vasomotion (văs″ō-mō′shŭn) [″ + *motio,* movement] Change in caliber of a blood vessel.

vasomotor (văs″ō-mō′tor) [″ + *motor,* a mover] Pert. to the nerves that innervate the smooth muscle in the walls of arteries and veins, and thereby alter or preserve vascular tone. Sympathetic impulses to all arteries and veins maintain normal constriction. More impulses per second cause vasoconstriction; fewer impulses per second, vasodilation. For example, if a stressful stimulus, such as hemorrhage, causes increased vasomotor nerve activity, vasoconstriction results, which limits blood loss and maintains blood pressure. SEE: *vasoconstrictor; vasodilator*.

vasomotor epilepsy Epilepsy with vasomotor changes in the skin.

vasomotor spasm Spasm of smaller arteries.

vasomotor system The part of the nervous system that controls the size of the blood vessels.

vasoneuropathy (văs″ō-nū-rŏp′ă-thē) Disease due to the combined effect of the vascular and nervous systems.

vasoneurosis (văs″ō-nū-rō′sĭs) [L. *vas,* vessel, + Gr. *neuron,* nerve, + *osis,* condition] A neurosis affecting blood vessels; a disorder of the vasomotor system.

vaso-orchidostomy (văs″ō-or″kĭd-ŏs′tō-mē) [″ + Gr. *orchis,* testicle, + *stoma,* mouth] Surgical connection of the epididymis to the severed end of the vas deferens.

vasoparesis (văs″ō-păr-ē′sĭs) [″ + Gr. *parienai,* to let fall] Partial paralysis or weakness of the vasomotor nerves.

vasopressor (văs″ō-prĕs′or) **1.** Causing contraction of the smooth muscle of arteries and arterioles. This increases resistance to the flow of blood and thus elevates blood pressure. **2.** An agent that stimulates contraction of smooth muscle of arteries and arterioles.

vasopuncture (văs′ō-pŭnk″chūr) [″ + *punctura,* prick] Puncture of the vas deferens.

vasoreflex (văs″ō-rē′flĕx) A reflex that alters the caliber of blood vessels.

vasorrhaphy (văs-or′ă-fē) [″ + Gr. *rhaphe,* seam, ridge] Surgical suture of the vas deferens.

vasosection (văs″ō-sĕk′shŭn) [″ + *sectio,* a cutting] Surgical division of the vasa deferentia.

vasosensory (văs″ŏ-sĕn′sō-rē) [″ + *sensorius,* pert. to sensation] Rel. to sensation in the blood vessels.

vasospasm (văs′ō-spăzm) [″ + Gr. *spasmos,* a convulsion] Spasm of a blood vessel. SYN: *angiohypotonia; angiospasm; vasoconstriction*. **vasospastic,** *adj.*

vasostimulant (văs″ō-stĭm′ū-lănt) [L. *vas,* vessel, + *stimulans,* goading] Exciting vasomotor action.

vasostomy (vă-sŏs′tō-mē) [″ + Gr. *stoma,* mouth] Surgical procedure of making an opening into the vas deferens.

vasotomy (văs-ŏt′ō-mē) [″ + Gr. *tome,* incision] Incision of the vas deferens.

vasotonia (văs″ō-tō′nē-ă) [″ + Gr. *tonos,* act of stretching, tension] The tone of blood vessels.

vasotonic (văs″ō-tŏn′ĭk) [″ + Gr. *tonikos,* pert. to tone] **1.** Pert. to the tone of a vessel. **2.** Causing vasotonia.

vasotrophic (văs″ō-trŏf′ĭk) [″ + Gr. *trophe,* nourishment] Concerned with the nutrition of blood vessels.

vasotropic (văs″ō-trŏp′ĭk) Affecting blood vessels.

vasovagal (văs″ō-vā′găl) Concerning the action of stimuli from the vagus nerve on blood vessels.

vasovasostomy (văs″ō-vă-sŏs′tō-mē) [″ + *vas,* vessel, + *stoma,* mouth] Rejoining of the previously severed ductus deferens of the testicle.

vasovesiculectomy (văs″o-vĕ-sĭk″ū-lĕk′tō-mē) [″ + *vesicula,* tiny sac, + Gr. *ektome,* excision] Excision of the vas deferens and seminal vesicles.

vasovesiculitis (văs″ō-vĕ-sĭk″ū-lī′tĭs) [″ + *vesicula,* a tiny bladder, + Gr. *itis,* inflammation] Inflammation of the vas deferens and seminal vesicles.

vastus (văs′tŭs) [L., vast] **1.** Great, large, extensive. **2.** One of three muscles of the anterior thigh.

Vater's corpuscles Pacinian corpuscles.

Vater's papilla The duodenal end of the drainage systems of the pancreatic and common bile ducts. Formerly called Vater's ampulla.

VATS *Video-assisted thoracic surgery*.

vault (vawlt) A part or structure resembling a dome or arched roof.

VBAC *vaginal birth after previous cesarean*.

VC *vital capacity*.

VD *venereal disease*.

VDH *valvular disease of the heart*.

VDRL *Venereal Disease Research Laboratories*.

vection (vĕk′shŭn) [L. *vectio,* a carrying] **1.** Transfer of disease agents by a vector from the sick to the well. **2.** Illusion of self-motion. This may be produced experimentally by having the subject seated within a drum that rotates while the subject remains stationary.

vectis (vĕk′tĭs) [L., pole] A curved lever for making traction on the presenting part of the fetus.

vector (vĕk′tor) [L., a carrier] **1.** Any force or influence that is a quantity completely specified by magnitude, direction, and sense, which can be represented by a straight line of appropriate length and direction. **2.** A carrier, usually an insect or other arthropod, that transmits the causative organisms of disease from infected to noninfected individuals, esp. one in which the organism goes through one or more stages in its life cycle. **3.** An agent such as a retrovirus that is used to introduce genetic material into the nucleus of a diseased cell in an attempt to cure a genetic illness or a malignancy.

biological v. An animal vector in which the disease-causing organism multiplies or develops prior to becoming infective for a susceptible person.

mechanical v. A vector in or upon which growth and development of the infective agent do not occur.

vectorcardiogram (vĕk″tor-kăr′dē-ō-grăm) [″ + Gr. *kardia,* heart, + *gramma,* something written] A graphic record of the direction and magnitude of the electrical forces of the heart's action by means of a continuous series of vector loops. Analysis of the configuration of these loops permits certain statements to be made about the state of health or diseased condition of the heart. At any moment the electrical activity of the heart can be represented as an electrical vector with a specific direction and magnitude. This is called the instantaneous cardiac vector. A series of these vectors may be established for the entire cardiac cycle. By joining the tips of these vectors with a continuous line, the vectorcardiogram loop is formed. The configuration so obtained may be projected on the frontal plane or viewed as a three-dimensional loop. Three vectorcardiogram loops are formed during

each cardiac cycle—one for the electrical activity of the atrium; one for ventricular depolarization; one for ventricular repolarization.

spatial v. Depiction of the vectorcardiogram in three planes—frontal, sagittal, and horizontal.

vectorcardiography (vĕk″tor-kăr″dē-ŏg′ră-fē) Analysis of the direction and magnitude of the electrical forces of the heart's action by a continuous series of loops (vectors) that represent the cardiac cycle.

vectorial (vĕk-tō′rē-ăl) [L. *vector,* a carrier] Rel. to a vector.

VEE *Venezuelan equine encephalitis.*

vegan (vĕj′ăn) A vegetarian who omits all animal protein from the diet.

veganism (vĕj′ă-nĭzm) A form of vegetarianism in which no forms of animal protein are consumed. The diet is devoid of meat, fish, poultry, eggs and dairy products.

vegetable (vĕj′ĕ-tă-bl) **1.** Pert. to, of the nature of, or derived from plants. **2.** A herbaceous plant, esp. one cultivated for food. **3.** The edible part or parts of plants that are used as food, including the leaves, stems, seeds and seed pods, flowers, roots, tubers, and fruits.

Vegetables are important sources of minerals and vitamins; provide bulk, which stimulates intestinal motility; and are sources of energy. Caloric value is indirectly proportional to water content. Copper is estimated at 1.2 mg/kg for leafy vegetables, and 0.7 mg/kg for nonleafy ones.

Plant and vegetable proteins individually do not contain the complete complement of essential amino acids. By combining vegetables, it is possible to obtain an adequate and balanced mixture of essential amino acids. For example, corn is low in lysine but has an adequate amount of tryptophan; beans are adequate in lysine but low in tryptophan. Although neither is a sufficient source of protein alone, in combination, they are an adequate protein source. Similarly rice and beans serve to complement the deficiencies in the other and together are a complete source of protein. SEE: *incaparina*.

All starches in vegetables must be changed to sugars before they can be absorbed. Dry heat changes starch to dextrin; heat and acid or an enzyme change dextrin to dextrose. In germinating grain, starch is changed to dextrin and dextrose. Fermented dextrose produces alcohol and carbon dioxide.

cruciferous v. A family of vegetables (including broccoli, brussels sprouts, cabbage, and cauliflower) named for their cross-shaped flowers. People who eat a diet rich in these vegetables are found to have a decreased incidence of cardiovascular diseases, strokes, and cancer, among other illnesses.

vegetal (vĕj′ĕ-tăl) **1.** Pert. to plants. **2.** Tropic or nutritional, esp. with reference to that part of an ovum which contains the yolk. SEE: *pole, vegetal*.

vegetarian (vĕj-ĕ-tā′rē-ăn) [from *vegetable,* coined 1847 by the Vegetarian Society] A person who does not eat animal flesh or, in some instances, any animal byproducts. Different approaches result in individual variation in whether fish, eggs, and/or dairy foods are accepted dietary components. Vegetarians must carefully plan their meals to ensure that they consume an adequately nutritive diet.

vegetarianism (vĕj-ĕ-tā′rē-ăn-ĭzm) [″ + Gr. *-ismos,* condition] The practice and philosophy of eating grains, nuts, vegetables and fruits, but not meats or animal flesh. Approaches to vegetarianism differ—some vegetarians eat fish, eggs, and/or dairy products, while others do not.

vegetate (vĕj′ĕ-tāt) [LL. *vegetare,* to grow] **1.** To grow luxuriantly with the production of fleshy or warty outgrowths such as a polyp. **2.** To lead a passive existence mentally or physically, or both; to do little more than eat and maintain autonomic body functions.

vegetation (vĕj-ĕ-tā′shŭn) A morbid luxurious outgrowth on any part, esp. wartlike projections made up of collections of fibrin in which are enmeshed white and red blood cells; sometimes seen on denuded areas of the endocardium covering the valves of the heart.

adenoid v. Fungus-like masses of lymphoid tissue in the nasopharynx.

vegetative (vĕj′ĕ-tā″tĭv) **1.** Having the power to grow, as plants. **2.** Functioning involuntarily. **3.** Quiescent, passive, denoting a stage of development.

vegetative nervous system An out-of-date term for the autonomic nervous system. SEE: *autonomic nervous system*.

vegetative state Persistent vegetative state.

vegetoanimal (vĕj″ĕ-tō-ăn′ĭ-măl) Concerning plants and animals.

vehicle (vē′ĭ-kl) [L. *vehiculum,* that which carries] **1.** An inert agent that carries the active ingredient in a medicine (e.g., a syrup in liquid preparations). **2.** Any object that carries another (e.g., a work surface may be a vehicle that transmits germs from one person to another; a patch applied to the skin may be a vehicle that permits drug delivery to the body).

veil (vāl) [L. *velum,* a covering] **1.** Any veil-like structure. **2.** A piece of the amniotic sac occasionally covering the face of a newborn infant. SYN: *caul*. **3.** Slight

alteration in the voice in order to disguise it.

vein (vān) [L. *vena,* vein] A vessel carrying deoxygenated (dark red) blood to the heart, except for the pulmonary veins, which carry oxygenated blood. The vein wall has three layers: an endothelial lining folded into valves, a thin smooth muscle middle layer, and a thin fibrous connective tissue outer layer. Veins differ from arteries in their larger capacity and greater number; also in their thinner walls, larger and more frequent anastomoses, and presence of valves that prevent backward circulation. The systemic veins consist of two sets, superficial or subcutaneous, and the deep veins, with frequent anastomoses between the two. The former do not usually accompany an artery, as do the latter. The systemic veins may also be considered in three groups—those entering the right atrium through the superior vena cava, those through the inferior vena cava, and those through the coronary sinus. SEE: illus.; *circulation; vena*.

anterior tibial v. A vein that drains blood from the lower leg and foot and joins the popliteal vein.

axillary v. A vein that is formed by the merger of the basilic and brachial veins, drains blood from the upper extremity, and becomes the subclavian vein at the lateral border of the first rib.

azygos v. A single vein arising in the abdomen as a branch of the ascending lumbar vein. It passes upward through the aortic hiatus of the diaphragm into the thorax, then along the right side of the vertebral column to the level of the fourth thoracic vertebra, where it turns and enters the superior vena cava. In the thorax, it receives the hemiazygos, accessory azygos, and bronchial veins, as well as the right intercostal and subcostal veins. If the inferior vena cava is obstructed, the azygos vein is the principal vein by which blood can return to the heart.

brachial v. The vein that accompanies the brachial artery and joins the axillary vein.

brachiocephalic v. The right and left veins, each formed by the union of the internal jugular with the subclavian vein.

cephalic v. A vein that drains blood from the superficial arm and forearm and merges with the brachial vein in the upper arm to form the axillary vein.

common iliac v. Either of two veins that drain blood from the lower limb and lower abdomen. The two common iliac veins unite to form the inferior vena cava.

cranial venous sinus v. Any of a group of veins between the two layers of the dura mater that drain blood and reabsorbed cerebrospinal fluid from the brain and join the internal jugular vein.

external iliac v. A vein that drains blood from the lower limb and abdominal wall and joins the common iliac vein.

external jugular v. A vein that drains blood from the deep and superficial veins of the head and crosses the sternocleidomastoid muscle before entering the subclavian vein.

great saphenous v. A vein that drains blood from the superficial foot, leg, and thigh and joins the femoral vein.

innominate v. Brachiocephalic veins.

internal iliac v. A vein that drains blood from the pelvis and buttocks and joins the common iliac vein.

internal jugular v. ABBR: IJ. A vein that drains blood from the face, neck, and the cranial venous sinuses and unites with the subclavian vein to form the brachiocephalic vein. It is a vein commonly used to gain access to the central circulation or the right side of the heart.

ovarian v. Either of two veins (left and right) that drain blood from the ovaries. The left ovarian vein joins the left renal vein; the right ovarian vein joins the inferior vena cava.

popliteal v. A vein that drains blood from the knee and joins the femoral vein.

posterior tibial v. A vein that drains blood from the lower leg and foot and joins the popliteal vein.

radial v. A vein that drains blood from the forearm and the hand and joins the brachial vein.

renal v. A vein that drains blood from the kidney and joins the inferior vena cava. Blood clots may form in the renal veins in the nephrotic syndrome.

small saphenous v. A vein that drains blood from the lateral border of the superficial leg and foot and joins the popliteal vein.

testicular v. Either of two veins (left and right) that drain blood from the testes. The left testicular vein joins the left renal vein; the right testicular vein joins the inferior vena cava.

ulnar v. A vein that drains blood from the forearm and the hand and joins the brachial vein.

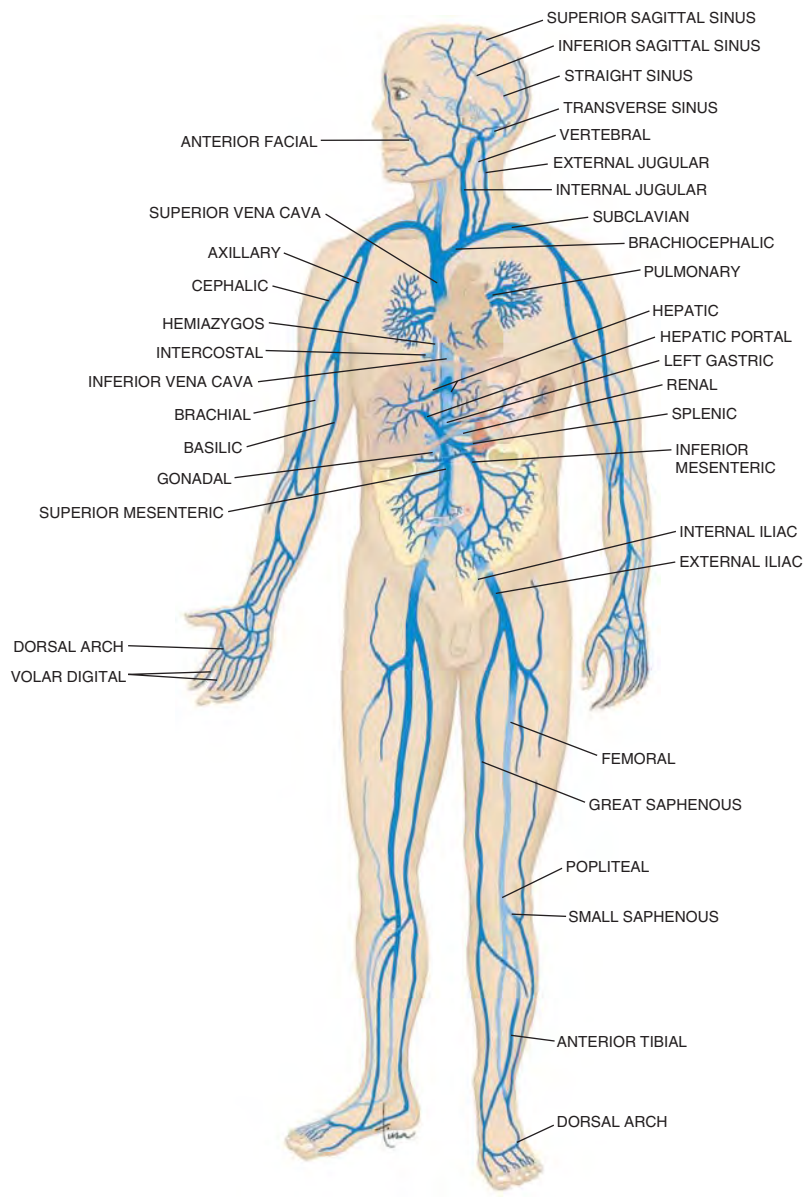
velamen (vē-lā′mĕn) *pl.* **velamina** [L., veil] Any covering membrane.

v. nativum The skin covering the body.

v. vulvae Hottentot apron.

velamentous (vĕl″ă-mĕn′tŭs) Expanding like a veil, or sheet.

velamentum (vĕl″ă-mĕn′tŭm) *pl.* **velamenta** [L., a cover] A membranous covering.



SYSTEMIC VEINS

velar (vē′lăr) [L. *velum,* a veil] Pert. to a velum or veil-like structure.

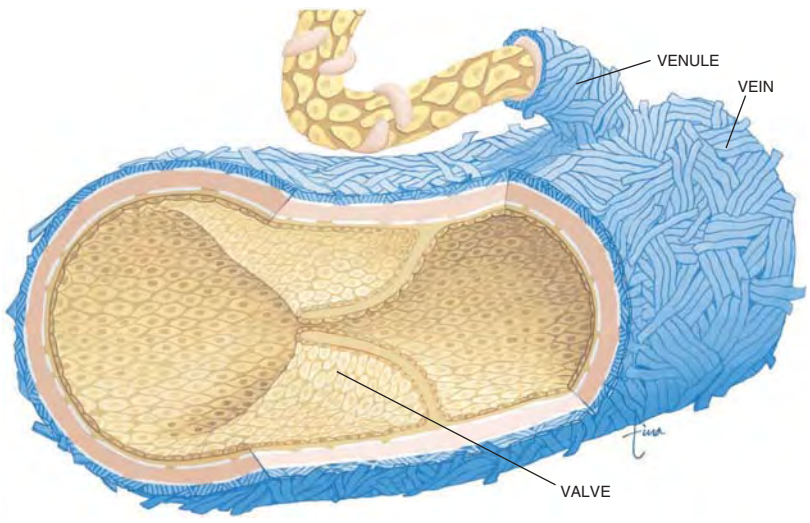
veliform (vĕl′ĭ-form) Velamentous.

vellus (vĕl′ŭs) [L., fleece] The fine hair present on the body after the lanugo hair of the newborn is gone.

velopharyngeal (vĕl″ō-fă-rĭn′jē-ăl) [L. *velum,* veil, + Gr. *pharynx,* throat] Concerning the soft palate and the pharynx.

Velpeau's bandage (vĕl-pōz′) [Alfred Velpeau, Fr. surgeon, 1795–1867] A special immobilizing roller bandage that incorporates the shoulder, forearm, and arm. SEE: *bandage* for illus.

Velpeau's deformity Deformity seen in



STRUCTURE OF A VEIN AND VENULE

Colles' fracture, in which the lower fragment is displaced backward.

velum (vē′lŭm) [L., veil] Any veil-like structure.

v. palatinum Soft palate.

vena (vē′nă) *pl.* **venae** [L.] A vein.

v. cava inferior The principal vein draining blood from the lower portion of the body. It is formed by junction of the two common iliac veins and terminates in the right atrium of the heart. SEE: *heart*.

v. cava superior The principal vein draining blood from the upper portion of the body. It is formed by the junction of the right and left brachiocephalic veins and empties into the right atrium of the heart. SEE: *heart*.

vena caval syndrome Supine hypotensive syndrome.

venacavography (vē″nă-kā-vŏg′ră-fē) Radiography of the vena cava during the injection of a contrast medium.

venae comitantes (vē″nē kō″mĭ-tăn′tēz) [L.] Two or more veins accompanying an artery. They are usually present with the deep arteries of the extremities.

venation (vē-nā′shŭn) The distribution of veins to an organ or structure.

vendor Any person or company that designs, develops, sells, and/or supports goods or services to or for another party.

venectasia (vē″nĕk-tā′zē-ă) [L. *vena,* a vein, + Gr. *ektasis,* dilation] Dilation of a vein. SYN: *phlebectasia*.

venectomy (vē-nĕk′tō-mē) [″ + Gr. *ektome,* excision] Phlebectomy.

veneer (vĕ-nēr′) In dentistry, a man-made material, such as an acrylic resin, that can be bonded to the surface of a tooth. It is sometimes used for cosmetic reasons.

venene (vē-nēn′) A mixture of venoms from poisonous snakes.

venenosalivary (vĕn″ĕ-nō-săl′ĭ-vĕr″ē) Venomosalivary.

venenosity (vĕn″ĕ-nŏs′ĭ-tē) State of being venomous.

venenous (vĕn′ĕn-ŭs) [L. *venenum,* poison] Poisonous.

venepuncture (vĕn′ē-pŭnk″chūr) [L. *vena,* vein, + *punctura,* a point] Venipuncture.

venereal (vē-nē′rē-ăl) [L. *venereus*] Pert. to or resulting from sexual intercourse.

venereal collar SEE: *leukoderma, syphilitic*.

venereal disease A term formerly used to describe any illness transmitted by intimate sexual contact. SEE: *Nursing Diagnoses Appendix.*

venereologist (vē-nēr″ē-ŏl′ō-jĭst) [″ + Gr. *logos,* word, reason] A doctor who specializes in the treatment of sexually transmitted diseases.

venereology (vē-nēr″ē-ŏl′ō-jē) The scientific study and treatment of sexually transmitted diseases.

venesection (vĕn″ĕ-sĕk′shŭn) [L. *vena,* vein, + *sectio,* a cutting] Surgical opening of a vein for withdrawal of blood. SYN: *phlebotomy*.

venin(e) (vĕn′ĭn) [L. *venenum,* poison] Toxic substance in snake venom. SYN: *venene*.

venipuncture (vĕn′ĭ-pŭnk″chūr) [L. *vena,* vein, + *punctura,* a point] Puncture of a vein, typically to obtain a specimen of blood. The pain of venipuncture may be diminished by several

methods, including application of cold to the area just prior to the puncture; injection of sterile, normal saline intracutaneously to produce blanching of the site; and use of a local anesthetic to produce a wheal at the site. SEE: *intravenous infusion* for illus.

venisuture (vĕn′ĭ-sū″chūr) [″ + *sutura,* a seam] Suture of a vein. SYN: *phleborrhaphy*.

venlafaxine An antidepressant that works by inhibiting serotonin and norepinephrine reuptake, thereby improving mood.

veno- Combining form meaning *vein.*

venoatrial (vē″nō-āt′rē-ăl) [″ + *atrium,* corridor] Rel. to the vena cava and the atrium.

venoauricular (vē″nō-aw-rĭk′ū-lăr) [″ + *auricula,* little ear] Venoatrial.

venoclysis (vē-nŏk′lĭ-sĭs) [″ + Gr. *klysis,* a washing] The continuous injection of medicinal or nutrient fluid intravenously.

venofibrosis (vē″nō-fī-brō′sĭs) Phlebosclerosis.

venogram (vē′nō-grăm) [″ + Gr. *gramma,* something written] **1.** A radiograph of the veins. SYN: *phlebogram*. **2.** A tracing of the venous pulse.

venography (vē-nŏg′ră-fē) [″ + Gr. *graphein,* to write] **1.** A radiographic procedure to visualize veins filled with a contrast medium; most commonly used to detect thrombophlebitis. **2.** The making of a tracing of the venous pulse.

venom (vĕn′ŏm) [L. *venenum,* poison] A poison secreted by some animals, such as insects, spiders, or snakes, and transmitted by bites or stings.

snake v. The poisonous secretion of the labial glands of certain snakes. Venoms contain proteins, chiefly toxins and enzymes, which are responsible for their toxicity. They are classified as neurocytolysins, hemolysins, hemocoagulins, proteolysins, and cytolysins on the basis of the effects produced.

venomization (vĕn″ŭm-ī-zā′shŭn) Treatment of a material with snake venom.

venomosalivary (vĕn″ō-mō-săl′ĭ-vĕr″ē) Secreting saliva with venom in it.

venomotor (vē″nō-mō′tor) [L. *vena,* vein, + *motus,* moving] Pert. to constriction or dilatation of veins.

venomous (vĕn′ō-mŭs) **1.** Poisonous. **2.** Pert. to animals or insects that have venom-secreting glands.

venomous snake In the U.S., the coral snakes and pit vipers (copperhead, cottonmouth moccasin, and rattlesnake).

veno-occlusive (vē″nō-ŏ-kloo′sĭv) Concerning obstruction of veins.

venoperitoneostomy (vē″nō-pĕr″ĭ-tō″nē-ŏs′tō-mē) [L. *vena,* vein, + Gr. *peritonaion,* peritoneum, + *stoma,* mouth] A one-way valve shunt that connects the peritoneum with the internal jugular or subclavian vein, permitting the escape of ascitic fluid into the venous circulation. SEE: *LeVeen shunt*.

venosclerosis (vē″nō-sklĕ-rō′sĭs) [″ + Gr. *sklerosis,* to harden] Sclerosis of veins. SYN: *phlebosclerosis*.

venosinal (vē″nō-sī′năl) Concerning the vena cava and the right atrium of the heart.

venosity (vē-nŏs′ĭ-tē) [L. *vena,* vein] **1.** A condition in which there is an excess of venous blood in a part, causing venous congestion. **2.** Deficient aeration of venous blood.

venospasm (vē′nō-spăzm) [″ + Gr. *spasmos,* a convulsion] Contraction of a vein, which may follow infusion of a cold or irritating substance into the vein.

venostasis (vē″nō-stā′sĭs) [″ + Gr. *stasis,* standing still] The trapping of blood in an extremity by compression of veins, a method sometimes employed for reducing the amount of blood being returned to the heart.

venostat (vē′nō-stăt) [″ + Gr. *statikos,* standing] An appliance for performing venous compression.

venothrombotic (vē″nō-thrŏm-bŏt′ĭk) Having the property of inducing the formation of thrombi in veins.

venotomy (vē-nŏt′ō-mē) [″ + Gr. *tome,* incision] Incision of a vein.

venous (vē′nŭs) [L. *vena,* vein] Pert. to the veins or blood passing through them.

venous admixture A mixture of venous and arterial blood.

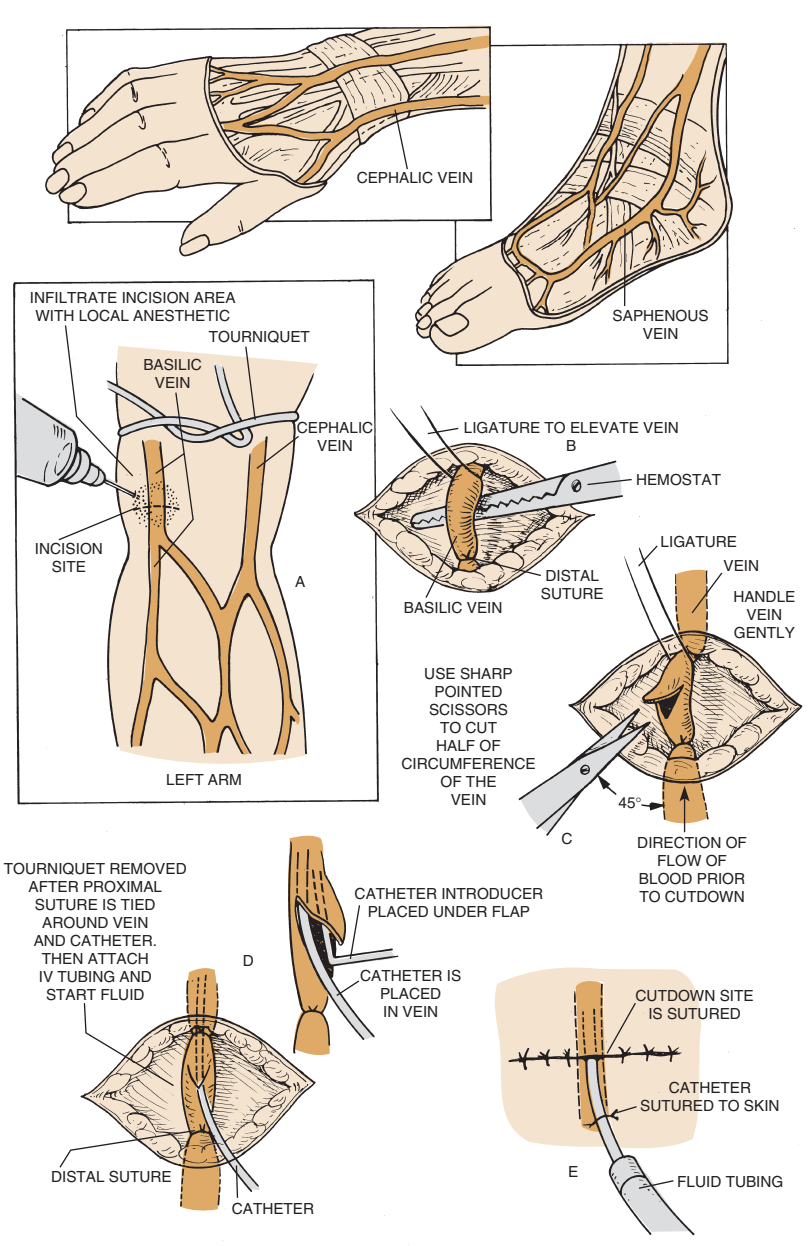
venous blood The dark, poorly oxygenated blood in the veins.

venous cutdown Surgical incision in a vein to place a catheter to permit intravenous administration of fluids or drugs. It is used in patients with vascular collapse when gaining percutaneous access to the circulation is difficult; however, this procedure is usually tried only when subclavian, jugular, or femoral access cannot be established. SEE: illus.

venous hum A murmur heard on auscultation over the larger veins of the neck.

venous hyperemia Passive hyperemia.

venous port Part of a venous access device consisting of a subcutaneously implanted port through which medications are injected. Leading from the port is a catheter that is inserted in the cephalic, jugular, or subclavian vein. The catheter extends into the superior vena cava. The port has a self-sealing septum through which a needle is inserted to have access for administering medications, such as cancer chemotherapy agents. The septum of the port is made to withstand from 1000 to 2000 punctures depending on the size needle used. Sterile technique is used each time a



VENOUS CUTDOWN

needle enters the port. The port permits unrestricted patient activity. Each time it is used care must be taken to be certain the line is open and that the catheter in the vein has remained in the proper position.

venous return The amount of blood returning to the atria of the heart.

venous sinus A large-capacity vessel that carries venous blood. Important venous sinuses are those of the dura mater draining the brain and those of the spleen.

venous sinus of sclera Schlemm's canal.

venovenostomy (vē″nō-vē-nŏs′tō-mē) [″ + ″ + Gr. *stoma,* mouth] The for-

mation of an anastomosis of a vein joined to a vein.

vent (vĕnt) [O.Fr. *fente,* slit] An opening in any cavity, esp. one for excretion.

alveolar v. An opening between adjacent alveoli of the lung.

venter (vĕn′tĕr) [L., belly] **1.** A belly-shaped part. **2.** The cavity of the abdomen. **3.** The wide swelling part or belly of a muscle.

ventilation (vĕn″tĭ-lā′shŭn) [L. *ventilare,* to air] **1.** The movement of air into and out of the lungs. **2.** Circulation of fresh air in a room and withdrawal of foul air. **3.** In physiology, the amount of air inhaled per day. This can be estimated by spirometry, multiplying the tidal air by the number of respirations per day. An average figure is 10,000 L. This must not be confused with the total amount of oxygen consumed, which is on the average only 360 L/day. These volumes are more than doubled during hard physical labor.

abdominal displacement v. A noninvasive type of artificial ventilation that relies on displacement of the abdominal contents to move the patient's diaphragm.

airway pressure release v. A type of mechanical ventilation in which continuous airway pressure is intermittently released to a lower pressure.

alveolar v. The movement of air into and out of the alveoli. It is a function of the size of the tidal volume, the rate of ventilation, and the amount of deadspace present in the respiratory system. It is determined by subtracting the deadspace volume from the tidal volume and multiplying the result by the respiratory rate.

asynchronous v. In emergency cardiac or critical care, the administration of artificial breaths to a patient that are timed independently of chest compressions.

continuous positive-pressure v. A method of mechanically assisted pulmonary ventilation. A device administers air or oxygen to the lungs under a continuous pressure that never returns to zero.

high-frequency jet v. A type of ventilation that continuously ventilates at 100 to 150 cycles/min; used in respiratory failure to provide continuous ventilation without the side effects of positive-pressure ventilation.

high-frequency oscillatory v. ABBR: HFOV. Pulmonary ventilation with multiple rapid breaths given at small tidal volumes. It is designed to limit the stretching and collapse of the alveoli that occur in conventional mechanical ventilation.

intermittent mandatory v. ABBR: IMV. Machine ventilation that delivers pressurized breaths at intervals while allowing for spontaneous breathing.

intermittent positive-pressure v. A mechanical method of assisting pulmonary ventilation, using a device that inflates the lungs under positive pressure. Exhalation is usually passive. SYN: *breathing, intermittent positive-pressure*.

liquid v. An experimental technique used in treating premature infants with surfactant-deficient lungs. Perfluorcarbons are used to carry oxygen to the lungs and remove carbon dioxide from them.

mandatory minute v. Ventilatory support that provides mechanical breaths when the patient's spontaneous breathing does not occur frequently enough.

maximum sustainable v. The normal maximum breathing pattern that can be maintained for 15 min (usually approx. 60% of maximum voluntary ventilation).

maximum voluntary v. The maximum amount of gas that can be ventilated into and out of the lungs in a voluntary effort in a given time, measured in liters per minute.

mechanical v. Any form of artificially supplied ventilation.

minute v. ABBR: MV. The volume of air inhaled and exhaled in 60 sec. SEE: *minute volume*.

noninvasive v. The use of airway support administered through a face ("nasal") mask instead of an endotracheal tube. Inhaled gases are given with positive end-expiratory pressure often with pressure support at a controlled rate and tidal volume. Numerous studies have shown this technique to be as effective, and better tolerated, than intubation and mechanical ventilation in selected patients with acute respiratory failure.

positive-pressure mechanical v. Mechanical ventilatory support that applies positive pressure to the airway. The objectives include improving pulmonary gas exchange, relieving acute respiratory acidosis, relieving respiratory distress, preventing and reversing atelectasis, improving pulmonary compliance, preventing further lung injury, and avoiding complications. Positive-pressure ventilation can be life saving, but complications such as toxic effects of oxygen, laryngeal injury, tracheal stenosis, alveolar injury, barotrauma, pneumonia, and psychological problems may occur. SEE: *pressure, positive end-expiratory*.

pressure support v. A type of assisted ventilation that supplements a spontaneous breath. The patient controls the frequency and the duration

and flow of inspiration from the ventilator.

protective v. A type of mechanical ventilation in which tidal volumes are set to avoid overstretching the alveoli, and pressures at the end of an inhaled breath are set to avoid alveolar collapse.

pulmonary v. The inspiration and expiration of air from the lungs.

synchronized intermittent mandatory v. ABBR: SIMV. Periodic assisted ventilation with positive pressure initiated by the patient and coordinated with spontaneous patient breaths. SEE: *intermittent mandatory v.*

transtracheal catheter v. An emergency procedure in which a catheter is placed percutaneously through the cricothyroid membrane and attached to a high-pressure, high-flow jet ventilator. This form of ventilation is used for patients who cannot be intubated.

ventilation coefficient The amount of air that must be respired for each liter of oxygen to be absorbed.

ventilation tube SEE: *grommet*.

ventilator (vĕnt′ĭ-lāt″or) A mechanical device for artificial ventilation of the lungs. The mechanism may be hand operated (although this is unusual) or machine driven and automated.

automatic transport v. ABBR: ATV. A portable ventilator that can be used while transporting patients between locations. The ATV is designed for short-term use and often has volume and rate controls.

ventilator support, weaning from The act of gradually removing persons with reversible forms of respiratory failure who are receiving mechanical ventilation from that support. This may be done by alternating full ventilatory support with increasingly long periods of unassisted breathing. The timing and frequency of the weaning periods should be individualized to each patient. Usually by the time the patient can tolerate 2 hr of spontaneous breathing, ventilatory support may be discontinued.

PATIENT CARE: Weaning from mechanical ventilation is done only in the stable patient in whom the acute precipitating event has been corrected. The respiratory therapist should review current arterial blood gas reports, breathing pattern, vital signs, and vital capacity before each attempt at weaning. The procedure should be described to the patient and he or she should be told what to expect and what his or her role in weaning will be. The nurse, physician, and respiratory therapist should reassure the patient that he or she will not be endangered by weaning trials or left alone during these periods. The nurse and respiratory therapist should also provide positive reinforcement regarding the patient's progress and the anticipated successful termination of support. Patient status and response to the procedure should be continuously evaluated.

ventilatory weaning response, dysfunctional ABBR: DVWR. A state in which a patient cannot adjust to lowered levels of mechanical ventilator support, which interrupts and prolongs the weaning process. SEE: *Nursing Diagnoses Appendix.*

ventouse (vĕn-toos′) [Fr.] A glass or glass-shaped vessel used in cupping.

ventrad (vĕn′trăd) [L. *venter,* belly, + *ad,* to] Toward the ventral aspect; the opposite of dorsad.

ventral (vĕn′trăl) [L. *ventralis,* pert. to the belly] Pert. to the belly; the opposite of dorsal. Hence, in quadrupeds, pert. to the lower or underneath side of the body; in humans, pert. to the anterior portion or the front side of the body.

ventralis (vĕn-trā′lĭs) [L.] Anterior, or closer to the front.

ventricle (vĕn′trĭk-l) [L. *ventriculus,* a little belly] **1.** A small cavity. **2.** Either of two lower chambers of the heart that, when filled with blood, contract to propel it into the arteries. The right ventricle forces blood into the pulmonary artery and thence into the lungs; the left pumps blood into the aorta to the rest of the body. **3.** One of the cavities of the brain filled with cerebrospinal fluid. SEE: illus.

aortic v. The left ventricle of the heart.

v. of Arantius The terminal depression of the median sulcus of the fourth ventricle of the brain.

fifth v. The cavity of the septum lucidum of the brain. It is between the two laminae of the septum lucidum.

fourth v. The cavity posterior to the pons and medulla and anterior to the cerebellum of the brain. It extends from the central canal of the upper end of the spinal cord to the aqueduct of the midbrain. Its roof is the cerebellum and the superior and inferior medullary vela. Its floor is the rhomboid fossa.

v. of larynx Morgagni's ventricle.

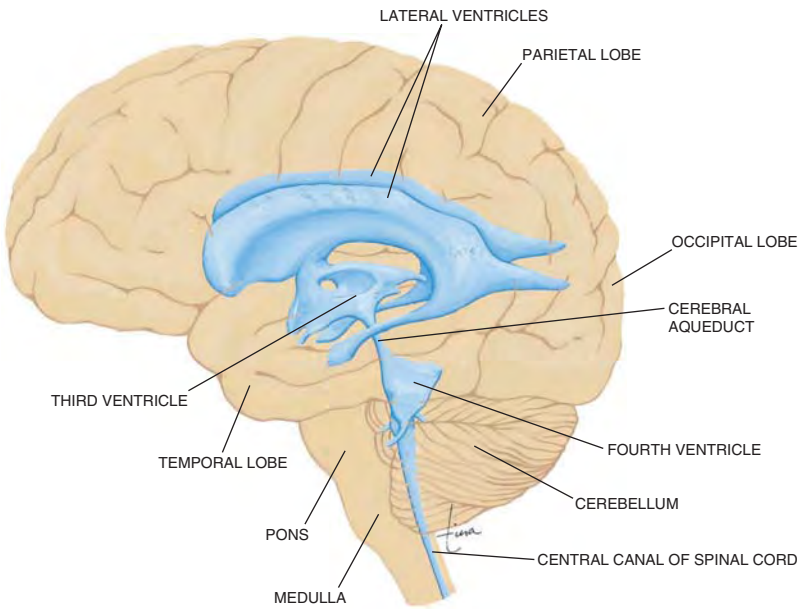
lateral v. The cavity in each cerebral hemisphere that communicates with the third ventricle through the interventricular foramen. It consists of a triangular central body and four horns, two inferior and two posterior.

left v. The cavity of the heart that receives blood from the left atrium and pumps it into the systemic circulation via the aorta.

Morgagni's v. SEE: under *Morgagni, Giovanni B.*

pineal v. The pineal recess of the third ventricle of the brain.

right v. The cavity of the heart that receives blood from the right atrium and



VENTRICLES OF THE BRAIN
Left lateral view

pumps it into the lungs via the pulmonary artery.

third v. The median cavity in the brain bounded by the thalamus and hypothalamus on either side, anteriorly by the optic chiasm; the floor is made up of the tuber cinereum, mammillary body, the posterior perforated substance and tegmentum of the cerebral peduncle; the roof is the ependyma. Anteriorly, it communicates with the lateral ventricles, and posteriorly, with the aqueduct of the midbrain. SYN: *ventriculus tertius*.

ventricular (vĕn-trĭk′ū-lăr) [L. *ventriculus,* a little belly] Pert. to a ventricle.

ventricular assist pumping Use of a device to temporarily replace the pumping action of a diseased or nonfunctioning heart. SEE: *intra-aortic balloon counterpulsation*.

ventricular compliance Distensibility or stiffness of the relaxed ventricle of the heart.

ventricular ligament A narrow band of fibrous tissue lying within each ventricular fold.

ventricular septal defect An abnormal opening in the septum between the ventricles of the heart that may produce shunting of blood from left to right, or other diseases.

ventriculitis (vĕn-trĭk″ū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of a ventricle.

ventriculoatriostomy (vĕn-trĭk″ū-lō-ā″trē-ŏs′tō-mē) [″ + *atrium,* corridor, + Gr. *stoma,* mouth] Plastic surgery for the relief of hydrocephalus. Subcutaneous catheters are placed to connect a cerebral ventricle to the right atrium via the jugular vein. The catheters contain one-way valves so that cerebrospinal fluid can flow into the catheters, but blood may not flow back into the cerebral ventricle.

ventriculocisternostomy (vĕn-trĭk″ū-lō-sĭs″tĕr-nŏs′tō-mē) [″ + *cisterna,* box, chest, + Gr. *stoma,* mouth] Plastic surgery to create an opening between the ventricles of the brain and the cisterna magna.

ventriculocordectomy (vĕn-trĭk″ū-lō-kor-dĕk′tō-mē) [″ + Gr. *khorde,* cord, + *ektome,* excision] Surgery for the relief of laryngeal stenosis. The ventricular floor is removed, but the buccal processes are left in place.

ventriculogram (vĕn-trĭk′ū-lō-grăm) [″ + Gr. *gramma,* something written] **1.** A radiograph of the cerebral ventricles. **2.** Injection of a contrast medium into the cardiac ventricles during angiocardiography, in order to estimate ejection fraction and wall motion.

ventriculography (vĕn-trĭk″ū-lŏg′ră-fē) [″ + Gr. *graphein,* to write] **1.** An obsolete technique for visualizing the brain radiographically, that relied on the injection of air into the cerebrospinal fluid. It has been replaced by CT and MRI scans of the brain. **2.** Visual-

ization of ventricles of the heart by radiograph after injection of a contrast material.

ventriculometry (vĕn-trĭk″ū-lŏm′ĕ-trē) [″ + Gr. *metron,* measure] The measurement of the intraventricular cerebral pressure.

ventriculonector (vĕn-trĭk″ū-lō-nĕk′tor) [L. *ventriculus,* a little belly, + *nector,* a joiner] Atrioventricular bundle.

ventriculopuncture (vĕn-trĭk′ū-lō-pŭnk″tūr) [″ + *punctura,* a point] The use of a needle to puncture a lateral ventricle of the brain.

ventriculoscopy (vĕn-trĭk″ū-lŏs′kō-pē) [″ + Gr. *skopein,* to examine] Examination of the ventricles of the brain with an endoscope.

ventriculostomy (vĕn-trĭk″ū-lŏs′tō-mē) [″ + Gr. *stoma,* mouth] Plastic surgery to establish communication between the floor of the third ventricle of the brain and the cisterna interpeduncularis. This is done to treat hydrocephalus.

ventriculosubarachnoid (vĕn-trĭk″ū-lō-sŭb″ă-răk′noyd) Concerning the cerebral ventricles and the subarachnoid spaces.

ventriculotomy (vĕn-trĭk″ū-lŏt′ō-mē) [″ + Gr. *tome,* incision] Surgical incision of a ventricle.

ventriculus (vĕn-trĭk′ū-lŭs) [L., a little belly] **1.** Ventricle. **2.** Stomach. **3.** A ventricle of the brain or heart.

v. tertius Third ventricle.

ventrimeson (vĕn″trĭ-mēs′ŏn) [″ + Gr. *mesos,* middle] The median line on the ventral surface of the body.

ventro- Combining form meaning *abdomen* or *ventral* (anterior).

ventrodorsal (vĕn″trō-dor′săl) [″ + *dorsum,* back] In a direction from the front to the back.

ventrofixation (vĕn″trō-fĭks-ā′shŭn) [″ + *fixatio,* to fix] The suture of a displaced viscus to the abdominal wall.

ventroinguinal (vĕn″trō-ĭng′gwĭ-năl) [″ + *inguen,* groin] Concerning the ventral and inguinal regions.

ventrolateral (vĕn″trō-lăt′ĕr-ăl) [″ + *latus,* side] Both ventral and lateral.

ventromedial (vĕn″trō-mē′dē-ăl) [″ + *medianus,* median] Both ventral and medial.

ventroscopy (vĕn-trŏs′kō-pē) [L. *venter,* belly, + Gr. *skopein,* to examine] Examination of the abdominal cavity by illumination. SYN: *celioscopy*.

ventrose (vĕn′trōs) Having a swelling like a belly.

ventrosity (vĕn-trŏs′ĭ-tē) Having an enlarged belly; obesity.

ventrosuspension (vĕn″trō-sŭs-pĕn′shŭn) [″ + *suspensio,* a hanging] The fixation of a displaced uterus to the abdominal wall.

ventrotomy (vĕn-trŏt′ō-mē) [″ + Gr. *tome,* incision] Incision into the abdominal cavity. SYN: *celiotomy; laparotomy*.

Venturi mask (vĕn-toor′ē) [Giovanni Battista Venturi, It. scientist, 1746–1822] A special mask for administering a controlled concentration of oxygen to a patient.

venturimeter (vĕn″tūr-ĭm′ĕ-tĕr) A device for measuring the flow of fluids through vessels.

venula (vĕn′ū-lă) [L., little vein] Venule.

venule (vĕn′ūl) [L., *venula,* little vein] A tiny vein continuous with a capillary. SYN: *venula*. SEE: *vein* for illus.

Venus, crown of (vē′nŭs) A papular eruption around the hairline on the forehead caused by secondary syphilis.

verapamil (vĕr-ăp′ă-mĭl) A calcium channel blocker, administered orally or intravenously to manage hypertension, angina pectoris, Prinzmetal's angina, and supraventricular arrhythmias. It is sometimes given to prevent migraine headaches. Its therapeutic classes are antianginal, antiarrhythmic, antihypertensive, and vascular headache suppressant. SYN: *Covera-HS*.

verbigeration (vĕr-bĭj″ĕr-ā′shŭn) [L. *verbigerare,* to chatter] Repetition of words that are either meaningless or have no significance.

verdigris (vĕr″dĭ-grĭs) [O.Fr. *vert de Grece,* green of Greece] **1.** Mixture of basic copper acetates. **2.** The green-gray deposit of copper carbonate on copper and bronze vessels.

verdohemoglobin (vĕr″dō-hēm′ō-glōb″ĭn) A greenish pigment occurring as an intermediate product in the formation of bilirubin from hemoglobin.

Verelan Verapamil.

Verelan PM Verapamil.

Verga's ventricle (vĕr′găz) [Andrea Verga, It. neurologist, 1811–1895] A cleftlike space between the corpus callosum and the body of the fornix of the brain.

verge (vĕrj) An edge or margin.

anal v. The transitional area between the smooth perianal area and the hairy skin.

vergence (vĕr′jĕns) [L. *vergere,* to bend] A turning of one eye with reference to the other; may be horizontal (convergence or divergence) or vertical (intravergence or supravergence). SEE: *-phoria*.

Verheyen's stars (fĕr-hī′ĕns) [Philippe Verheyen, Flemish anatomist, 1648–1710] Starlike venous plexuses on the surface of the kidney below its capsule.

vermicidal (vĕr″mĭ-sī′dăl) [L. *vermis,* worm, + *cidus,* kill] Destroying worms parasitic in the intestines.

vermicide (vĕr′mĭ-sīd) **1.** Destroying worms. **2.** An agent that will kill intestinal worms.

vermicular (vĕr-mĭk′ū-lăr) [L. *vermicularis*] Resembling a worm.

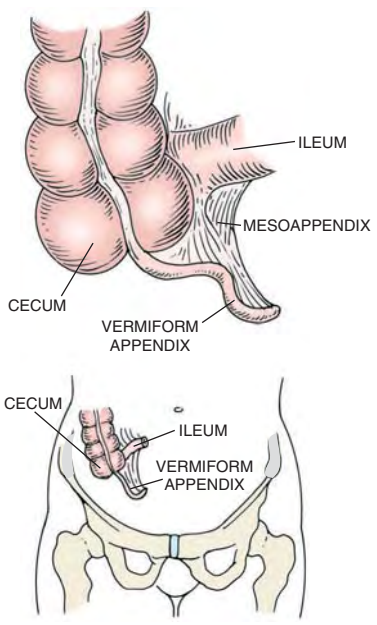
vermiculation (vĕr-mĭk″ū-lā′shŭn) [L. *vermiculare,* to wriggle] A wormlike motion, as in the intestines. SEE: *peristalsis*.

vermicule (vĕr′mĭ-kūl) [L. *vermiculus,* a small worm] **1.** A small worm. **2.** Having a wormlike shape.

vermiculose, vermiculous (vĕr-mĭk′ū-lōs, vĕr-mĭk′ū-lŭs) [L. *vermicularis,* wormlike] **1.** Infested with worms or larvae. **2.** Wormlike.

vermiform (vĕr′mĭ-form) [L. *vermis,* worm, + *forma,* shape] Shaped like a worm.

vermiform appendix A long, narrow, worm-shaped tube connected to the cecum. It varies in length from less than 1 in to more than 8 in (2.5 to 20.3 cm) with an average of about 3 in (7.6 cm). Its distal end is closed. It is lined with mucosa similar to that of the large intestine. Its inflammation is called appendicitis. The appendix contains many lymph nodules, but its function, if any, is not known. SEE: illus.



VERMIFORM APPENDIX

vermifugal (vĕr-mĭf′ū-găl) [″ + *fugare,* to put to flight] Expelling worms from the intestines.

vermifuge (vĕr′mĭ-fūj) Anthelmintic.

vermilionectomy (vĕr-mĭl″yŏn-ĕk′tō-mē) [″ + Gr. *ektome,* excision] Surgical removal of the vermilion border of the lip.

vermin (vĕr′mĭn) [L. *vermis,* worm] Animals such as mice, rats, roaches, lice, and bedbugs that despoil food, infest dwellings, or spread disease.

verminal (vĕr′mĭ-năl) Concerning or caused by worms.

vermination (vĕr″mĭn-ā′shŭn) Vermin or worm infestation.

verminosis (vĕr″mĭn-ō′sĭs) [″ + Gr. *osis,* condition] Infestation with vermin.

vermis (vĕr′mĭs) [L. worm] **1.** A worm. **2.** Vermis cerebelli.

v. cerebelli Median connecting lobe of the cerebellum.

inferior v. The anteroinferior portion of the vermis of the cerebellum, which includes the nodule, uvula, pyrami, and tuber.

superior v. The posterior dorsal portion of the vermis, which includes the folium, declive, culmen, and central lobule.

vernal (vĕr′năl) [L. *vernalis,* pert. to spring] Occurring in or pert. to the spring.

Vernet's syndrome (vĕr-nāz′) [Maurice Vernet, Fr. physician, b. 1887] Paralysis of the glossopharyngeal, vagus, and spinal accessory nerves on the opposite side of a lesion involving the jugular foramen.

vernix (vĕr′nĭks) [L.] Varnish.

v. caseosa A protective sebaceous deposit covering the fetus during intrauterine life, consisting of exfoliations of the outer skin layer, lanugo, and secretions of the sebaceous glands. It is most abundant in the creases and flexor surfaces. It is not necessary to remove this after the fetus is delivered. SEE: *sebum*.

verotoxin (vĕr-ō-tŏks′ĭn) A heat-labile toxin produced by some types of *Escherichia coli*.

verruca (vĕr-roo′kă) *pl.* **verrucae** [L., wart] Wart.

v. acuminata A pointed, reddish, moist wart about the genitals and the anus. It develops near mucocutaneous junctures, forming pointed, tufted, or pedunculated pinkish or purplish projections of varying lengths and consistency. Venereal warts should be treated with topically applied podophyllum resin. SYN: *condyloma; genital wart; venereal wart*.

v. digitata A form of verruca seen on the face and scalp, possibly serving as a starting point of cutaneous horns. Several filiform projections with horny caps are formed, closely grouped on a comparatively narrow base that in turn may be separated from the skin surface by a slightly contracted neck.

v. filiformis A small threadlike growth on the neck and eyelids covered with smooth and apparently normal epidermis.

v. gyri hippocampi One of the small wartlike protuberances on the convex surface of the gyrus hippocampi.

v. plana A flat or slightly raised wart.
v. plantaris Plantar wart.
v. vulgaris The common wart, usually found on the backs of the hands and fingers; however, it may occur on any area of the skin. SEE: illus.

VERRUCA VULGARIS

verruciform (vĕ-roo′sĭ-form) [L. *verruca,* wart, + *forma,* shape] Wartlike.
verrucose, verrucous (vĕr′roo-kōs, vĕr-roo′kŭs) [L. *verrucosus,* wartlike] Wartlike, with raised portions.
verrucosis (vĕr″oo-kō′sĭs) [L. *verruca,* wart, + Gr. *osis,* condition] The condition of having multiple warts.
verruga peruana (vĕ-roo′gă pĕr-wăn′ă) [Sp., Peruvian wart] The eruptive second clinical stage of bartonellosis. Oroya fever is the first or febrile stage.
versicolor (vĕr′sĭ-kŏl″or) [L., of changing colors] **1.** Having many shades or colors. **2.** Changeable in color. SEE: *tinea versicolor*.
version (vĕr′zhŭn) [L. *versio,* a turning] **1.** Altering of the position of the fetus in the uterus. It may occur naturally or may be done mechanically by the physician to facilitate delivery. SEE: *conversion*. **2.** Deflection of an organ such as the uterus from its normal position.
bipolar v. Changing of the position of the fetus by combined internal and external manipulation.
cephalic v. Turning of the fetus so that the head presents.
combined v. Mechanical version by combined internal and external manipulation.
external v. Improving the presentation of an unengaged fetus by placing one's hands on the mother's abdomen and pushing, turning, or rotating the fetus.
internal v. Podalic v.
pelvic v. Turning a fetus from a transverse lie to a vertex (head down) presentation.
podalic v. Using two hands (one inside the uterus and one on the abdominal wall) to change a twin fetus from a breech to a vertex presentation. SYN: *internal version*.
spontaneous v. Unassisted conversion of fetal presentation by uterine muscular contractions.
vertebra (vĕr′tĕ-bră) *pl.* **vertebrae** [L.] Any of the 33 bony segments of the spinal column: 7 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 4 coccygeal vertebrae. In adults, the five sacral vertebrae fuse to form a single bone, the sacrum, and the four rudimentary coccygeal vertebrae fuse to form the coccyx.

A typical vertebra consists of a ventral body and a dorsal or neural arch. In the thoracic region, the body bears on each side two costal pits for reception of the head of the rib. The arch that encloses the vertebral foramen is formed of two roots or pedicles and two laminae. The arch bears seven processes: a dorsal spinous process, two lateral transverse processes, and four articular processes (two superior and two inferior). A deep concavity, the inferior vertebral notch, on the inferior border of the arch provides a passageway for a spinal nerve. The successive vertebral foramina form the vertebral, or spinal, canal that encloses the spinal cord.

The bodies of successive vertebrae articulate with one another and are separated by intervertebral disks, disks of fibrous cartilage enclosing a central mass, the nucleus pulposus. The inferior articular processes articulate with the superior articular processes of the next succeeding vertebra in the caudal direction. Several ligaments (supraspinous, interspinous, anterior and posterior longitudinal, and the ligamenta flava) hold the vertebrae in position, yet permit a limited degree of movement. Motions of the vertebral column include forward bending (flexion), backward bending (extension), side bending (lateral flexion), and rotation. Lateral flexion and rotation motions are coupled so that whenever the vertebrae bend to the side, they also rotate and vice versa. SEE: *sacrum* for illus.

basilar v. The lowest of the lumbar vertebrae.
cervical v. One of the seven vertebrae of the neck.
coccygeal v. One of the rudimentary vertebrae of the coccyx.
v. dentata The second cervical vertebra.
false v. Fixed vertebra.
fixed v. The sacral and coccygeal vertebrae that fuse to form the sacrum and coccyx.
lumbar v. One of the five vertebrae between the thoracic vertebrae and the sacrum.
v. magnum Sacrum.
odontoid v. Axis (2).

v. prominens The seventh cervical vertebra.

sacral v. One of the five fused vertebrae forming the sacrum. SEE: *sacrum* for illus.

sternal v. One of the segments of the sternum.

thoracic v. One of the 12 vertebrae that connect the ribs and form part of the posterior wall of the thorax. SEE: *spinal column* for illus.

true v. One of the vertebrae that remain unfused through life: the cervical, thoracic, and lumbar.

vertebral (vĕr′tĕ-brăl) [L. *vertebra,* vertebra] Pert. to a vertebra or the vertebral column.

vertebral body A short column of bone forming the weight-supporting portion of a vertebra. From its dorsolateral surfaces project the roots of the arch of a vertebra.

vertebrarium (vĕr″tĕ-brā′rē-ŭm) [L.] A dated term for the vertebral column.

Vertebrata (vĕr″tĕ-brā′tă) A subphylum of the phylum Chordata characterized by possession of a segmented backbone or spinal column. It includes the following classes: Agnatha (cyclostomes), Chondrichthyes (cartilaginous fishes), Osteichthyes (bony fishes), Amphibia, Reptilia, Aves, and Mammalia. Members of this subphylum possess an axial notochord at some period of their existence.

vertebrate (vĕr′tĕ-brāt) [L. *vertebra,* vertebra] Having or resembling a vertebral column.

vertebrated (vĕr′tĕ-brāt″ĕd) Composed of jointed segments.

vertebrectomy (vĕr″tĕ-brĕk′tō-mē) [″ + Gr. *ektome,* excision] Excision of a vertebra or part of one.

vertebro- Combining form indicating *vertebra.*

vertebroarterial (vĕr″tĕ-brō-ăr-tē′rē-ăl) [″ + Gr. *arteria,* artery] Concerning the vertebral artery.

vertebrobasilar (vĕr″tĕ-brō-băs′ĭ-lăr) [″ + *basilaris,* basilar] Concerning the vertebral and basilar arteries.

vertebrochondral (vĕr″tĕ-brō-kŏn′drăl) [″ + Gr. *chondros,* cartilage] Pert. to the vertebrae and the costal cartilages.

vertebrocostal (vĕr″tĕ-brō-kŏs′tăl) [″ + *costa,* rib] Costovertebral.

vertebrofemoral (vĕr″tĕ-brō-fĕm′or-ăl) [″ + *femur,* thigh] Concerning the vertebrae and femur.

vertebroiliac (vĕr″tĕ-brō-ĭl′ē-ăk) [″ + *iliacus,* pert. to ilium] Concerning the vertebrae and ilium.

vertebroplasty (ver′tē-brō-plăs-tē) Plastic surgical repair of a vertebra.

vertebrosacral (vĕr″tĕ-brō-sā′krăl) [″ + *sacrum,* sacred] Concerning the vertebrae and sacrum.

vertebrosternal (vĕr″tĕ-brō-stĕr′năl) [″ + Gr. *sternon,* chest] Pert. to a vertebra and the sternum.

vertex (vĕr′tĕks) [L., summit] The top of the head. SYN: *corona capitis; crown.*

v. cordis The apex of the heart.

vertical (vĕr′tĭ-kăl) [L. *verticalis,* summit] **1.** Pert. to or situated at the vertex. **2.** Perpendicular to the plane of the horizon of the earth; upright.

verticalis (vĕr″tĭ-kā′lĭs) [L.] Vertical, indicating any plane that passes through the body parallel to the long axis of the body.

verticality (vĕr″tĭ-kăl′ĭ-tē) The ability to perceive accurately the vertical position in the absence of environmental cues.

verticillate (vĕr-tĭs′ĭl-āt, -tĭs-ĭl′āt) [L. *verticillus,* a little whirl] Arranged like the spokes of a wheel or a whorl.

verticomental (vĕr″tĭ-kō-mĕn′tăl) [L. *vertex,* summit, + *mentum,* chin] Concerning the crown of the head and the chin.

vertiginous (vĕr-tĭj′ĭ-nŭs) [L. *vertiginosus,* one suffering from dizziness] Pert. to or afflicted with vertigo.

vertigo (vĕr′tĭ-gō, vĕr-tī′gō) [L. *vertigo,* a turning round] The sensation of moving around in space (subjective vertigo) or of having objects move about the person (objective vertigo). Vertigo is sometimes inaccurately used as a synonym for dizziness, lightheadedness, or giddiness. It may be caused by a variety of entities, including middle ear disease; toxic conditions such as those caused by salicylates, alcohol, or streptomycin; sunstroke; postural hypotension; or toxemia due to food poisoning or infectious diseases. SEE: *vection* (2).

PATIENT CARE: Assessment should include whether the patient experiences a sense of turning or whirling and its direction; whether it is intermittent and the time of day it occurs; whether it is associated with drugs, turning over in bed, occupation, or menses; whether it is associated with nausea and vomiting or with nystagmus and migraine. Safety measures, such as the use of siderails in bed, are instituted. The patient should ambulate gradually after a slow, assisted move from a sitting position. The call bell should be available at all times; tissues, water, and other supplies should be within easy reach; and furniture and other obstacles should be removed from the path of ambulation. The patient who has undergone ear surgery and experiences severe vertigo should be confined to bed for several days and then begin to gradually increase activity.

alternobaric v. Vertigo associated with a sudden decrease in the pressure to which the inner ear is exposed. This could occur when a scuba diver ascends quickly or when an aircraft ascends quickly. SEE: *bends*.

auditory v. Vertigo due to disease of the ear.

benign paroxysmal positional v. ABBR: BPPV. A disorder of the inner ear (labyrinth) characterized by intermittent attacks of vertigo triggered by positional changes of the head. Each episode of vertigo may last from less than a minute to a few minutes, with varying degrees of symptom severity. Episodes may recur for weeks.

SYMPTOMS: A sudden change in head position brings on symptoms that may include dizziness or vertigo, lightheadedness, imbalance, and nausea. Dropping the head back when lying down, rolling over in bed, and getting out of bed are common problematic motions. BPPV may be called "top shelf" vertigo because its sufferers often feel dizzy and unsteady when tipping their heads back to look up. Stationary beauty parlor hairdryers may bring on symptoms. Symptoms of vertigo are often accompanied by nystagmus.

PATIENT CARE: Motion sickness medications (e.g., the antihistamine meclizine) may be prescribed to control associated nausea. Several physical maneuvers provide effective relief of symptoms. SEE: *canalith repositioning maneuver*.

central v. Vertigo caused by disease of the central nervous system.

cerebral v. Vertigo due to brain disease.

epidemic v. Vertigo that may occur in epidemic form. It is believed to be due to vestibular neuronitis.

epileptic v. Vertigo accompanying or following an epileptic attack.

essential v. Vertigo from an unknown cause.

gastric v. Vertigo associated with a gastric disturbance.

horizontal v. Vertigo that occurs while the patient is supine.

hysterical v. Vertigo accompanying hysteria.

labyrinthine v. An out-of-date term for Ménière's disease.

laryngeal v. Vertigo and fainting during a coughing spell in patients with chronic bronchitis. SYN: *laryngeal syncope*.

objective v. Vertigo in which stationary objects appear to be moving.

ocular v. Vertigo caused by disease of the eye.

organic v. Vertigo due to a brain lesion.

peripheral v. Vertigo due to disturbances in the peripheral areas of the central nervous system.

positional v. Vertigo that occurs when the head is tilted toward a specific axis. SYN: *postural vertigo*. SEE: *benign paroxysmal v.; Brandt-Daroff maneuvers; canalith repositioning maneuver*.

postural v. Positional vertigo.

rotary v. Subjective v.

subjective v. Vertigo in which the patient has the sensation of turning or rotating. SYN: *rotary vertigo*.

toxic v. Vertigo caused by the presence of a toxin in the body.

vertical v. Vertigo produced by standing or by looking up or down.

vestibular v. Vertigo due to disease or malfunction of the vestibular apparatus.

verumontanitis (vĕr″ū-mŏn″tăn-ī′tĭs) [L. *veru,* spit, dart, + *montanus,* mountainous, + Gr. *itis,* inflammation] Inflammation of the verumontanum. SYN: *colliculitis*.

verumontanum (vĕr″ū-mŏn-tā′nŭm) [L. *veru,* spit, dart, + *montanus,* mountainous] An elevation on the floor of the prostatic portion of the urethra where the seminal ducts enter.

vesalianum (vĕs-ā″lē-ā′nŭm) [Andreas Vesalius, Flemish anatomist and physician, 1514–1564] One of the sesamoid bones in the tendon of origin of the gastrocnemius muscle, and another on the outer border of the foot in the angle between the cuboid and fifth metatarsal.

Vesalius, foramen of (vĕs-ā′lē-ŭs) [Andreas Vesalius] The opening in the base of the skull transmitting an emissary vein.

Vesalius, vein of The small emissary vein from the cavernous sinus passing through the foramen of Vesalius and conveying blood to the pterygoid plexus.

vesica (vĕ-sī′kă) [L.] A bladder.

v. fellea Gallbladder.

v. prostatica A minute pouch in the prostatic urethra, remnant of the müllerian duct. SYN: *utriculus prostaticus*.

v. urinaria Urinary bladder.

vesical (vĕs′ĭ-kăl) Pert. to or shaped like a bladder.

vesical reflex An inclination to urinate caused by moderate bladder distention.

vesicant (vĕs′ĭ-kănt) [L. *vesicare,* to blister] **1.** Blistering; causing or forming blisters. **2.** An agent used to produce blisters. It is much less severe in its effects than are escharotics. **3.** A blistering gas used in chemical warfare. SYN: *vesicatory*. SEE: *gas, vesicant*.

vesication (vĕs″ĭ-kā′shŭn) **1.** The process of blistering. **2.** A blister.

vesicatory (vĕs′ĭ-kă-tor″ē) Vesicant.

vesicle (vĕs′ĭ-kl) [L. *vesicula,* a little bladder] A small blister-like elevation on the skin containing serous fluid. Vesicles may vary in diameter from a few millimeters to a centimeter. They may be round, transparent, opaque, or dark elevations of the skin, sometimes containing seropurulent or bloody fluid. In sudamina, they result from sweat that cannot escape from the skin; in herpes, they are mounted on an inflammatory

base, having no tendency to rupture but associated with burning pain. In herpes zoster, they follow dermatomes. In dermatitis venenata, they result from contact with poison ivy or oak and are accompanied by great itching. They are also seen in dermatitis herpetiformis or multiformis. In impetigo contagiosa, they occur, esp. in children, in discrete form, flat and umbilicated, filled with straw-colored fluid, with no tendency to break. They dry up, forming yellow crusts with little itching. They are also seen in vesicular eczema, molluscum contagiosum, miliaria (prickly heat or heat rash), chickenpox, smallpox, and scabies. SEE: illus.; *herpes; miliaria*.

VESICLES

air v. An obsolete term for pulmonary alveolus.

allantoic v. The hollow, enlarged part of the allantois, esp. in birds and reptiles.

auditory v. That portion of the cerebral vesicle from which the exterior ear is formed. SYN: *otic vesicle*.

blastodermic v. Blastocyst.

brain v. One of the five embryonic subdivisions of the brain. SYN: *encephalic vesicle*.

cerebral v. Brain v.

chorionic v. The outer villus-covered layer of the early embryo. It encloses the embryo, amnion, umbilical cord, and yolk stalk.

compound v. Multilocular v.

encephalic v. Brain v.

lens v. The embryonic vesicle formed from the lens pit. It develops into the lens of the eye.

multilocular v. A vesicle that contains multiple chambers.

optic v. A hollow outgrowth from the lateral aspects of the embryonic brain. The retinae and optic nerves develop from these paired vesicles.

otic v. Auditory v.

primary brain v. One of the three earliest subdivisions of the embryonic neural tube.

seminal v. One of two saccular glands below the urinary bladder in males. The duct from each joins the vas deferens on its own side to form the ejaculatory duct. The seminal vesicle produces an alkaline, fructose-rich secretion that enhances sperm motility and nourishes the sperm.

umbilical v. The portion of the embryonic yolk sac outside the body cavity.

vesico- (vĕs′ĭ-kō) Combining form meaning *bladder, vesicle.*

vesicoabdominal (vĕs″ĭ-kō-ăb-dŏm′ĭ-năl) [L. *vesica,* bladder, + *abdomen,* belly] Concerning the urinary bladder and the abdomen.

vesicocele (vĕs′ĭ-kō-sēl″) [L. *vesica,* bladder, + Gr. *kele,* tumor, swelling] Hernia of the bladder into the vagina. SYN: *cystocele*.

vesicocervical (vĕs″ĭ-kō-sĕr′vĭ-kăl) [″ + *cervix,* neck] Rel. to the urinary bladder and cervix uteri.

vesicoclysis (vĕs″ĭ-kŏk′lĭ-sĭs) [″ + Gr. *klysis,* a washing] Injection of fluid into the bladder.

vesicoenteric (vĕs″ĭ-kō-ĕn-tĕr′ĭk) [″ + Gr. *enteron,* intestine] Concerning the urinary bladder and intestine.

vesicofixation (vĕs″ĭ-kō-fĭks-ā′shŭn) [L. *vesica,* bladder, + *fixatio,* a fixing] Attachment of the uterus to the bladder or the bladder to the abdominal wall.

vesicoprostatic (vĕs″ĭ-kō-prŏs-tăt′ĭk) [″ + Gr. *prostates,* prostate] Rel. to the bladder and prostate.

vesicopubic (vĕs″ĭ-kō-pū′bĭk) [″ + NL. *(os) pubis,* bone of the groin] Pert. to the bladder and os pubis.

vesicopustule (vĕs″ĭ-kō-pŭs′tūl) [″ + *pustula,* blister] A vesicle in which pus has developed.

vesicosigmoid (vĕs″ĭ-kō-sĭg′moyd) [″ + Gr. *sigmoid,* shaped like Gr. letter *σ*] Concerning the urinary bladder and sigmoid colon.

vesicospinal (vĕs″ĭ-kō-spī′năl) [″ + *spina,* thorn] Rel. to the urinary bladder and spinal cord.

vesicostomy (vĕs″ĭ-kŏs′tō-mē) [″ + Gr. *stoma,* mouth] Surgical production of an opening into the bladder.

vesicotomy (vĕs″ĭ-kŏt′ō-mē) [″ + Gr. *tome,* incision] Incision of the bladder.

vesicoumbilical (vĕs″ĭ-kō-ŭm-bĭl′ĭ-kăl) [″ + *umbilicus,* navel] Concerning the urinary bladder and umbilicus.

vesicoureteral (vĕs″ĭ-kō-ū-rē′tĕr-ăl) [″ + Gr. *oureter,* ureter] Concerning the urinary bladder and a ureter.

vesicouterine (vĕs″ĭ-kō-ū′tĕr-ĭn) [″ + *uterinus,* pert. to the womb] Pert. to the urinary bladder and uterus.

vesicouterine pouch Downward extension of the peritoneal cavity located between the bladder and uterus.

vesicouterovaginal (vĕs″ĭ-kō-ū″tĕr-ō-văj′ĭ-năl) [″ + *uterus,* womb, + *vagina,* sheath] Concerning the urinary bladder, the uterus, and the vagina.

vesicovaginal (vĕs″ĭ-kō-văj′ĭ-năl) [″ + *vagina,* sheath] Vaginovesical.

vesicovaginorectal (vĕs″ĭ-kō-văj″ĭ-nō-rĕk′tăl) [″ + *vagina,* sheath, + *rectum,* straight] Concerning the urinary bladder, vagina, and rectum.

vesicula (vĕ-sĭk′ū-lă) *pl.* **vesiculae** [L.] A small bladder or vesicle.

v. seminalis Seminal vesicle.

vesicular (vĕ-sĭk′ū-lăr) Pert. to vesicles or small blisters.

vesicular eczema Eczema accompanied by the formation of vesicles.

vesiculated (vĕ-sĭk′ū-lāt″ĕd) Having vesicles present.

vesiculation (vĕ-sĭk″ū-lā′shŭn) [L. *vesicula,* a tiny bladder] The formation of vesicles or the state of having or forming them.

vesiculectomy (vĕ-sĭk″ū-lĕk′tō-mē) [″ + Gr. *ektome,* excision] Partial or complete excision of a vesicle, particularly a seminal vesicle.

vesiculiform (vĕ-sĭk′ū-lĭ-form) [″ + *forma,* shape] Having the shape of a vesicle.

vesiculitis (vĕ-sĭk″ū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of a vesicle, particularly the seminal vesicle.

vesiculobronchial (vĕ-sĭk″ū-lō-brŏng′kē-ăl) [″ + Gr. *bronchos,* windpipe] Both vesicular and bronchial.

vesiculocavernous (vĕ-sĭk″ū-lō-kăv′ĕr-nŭs) [″ + *caverna,* a hollow] Vesicular and cavernous.

vesiculogram (vĕ-sĭk′ū-lō-grăm) [″ + Gr. *gramma,* something written] A radiograph of the seminal vesicles.

vesiculography (vĕ-sĭk″ū-lŏg′ră-fē) [″ + Gr. *graphein,* to write] Radiography of the seminal vesicles after the injection of a contrast medium. This procedure has been replaced by ultrasound imaging.

vesiculopapular (vĕ-sĭk″ū-lŏ-păp′ū-lăr) [″ + *papula,* pimple] Composed of vesicles and papules.

vesiculopustular (vĕ-sĭk″ū-lō-pŭs′tū-lăr) [″ + *pustula,* blister] Having both vesicles and pustules.

vesiculotomy (vĕ-sĭk″ū-lŏt′ō-mē) [″ + Gr. *tome,* incision] Surgical incision into a vesicle, as a seminal vesicle.

vesiculotubular (vĕ-sĭk″ū-lō-tū′bū-lăr) [″ + *tubularis,* like a tube] Sounds from auscultation of the chest that have both vesicular and tubular qualities.

vesiculotympanic (vĕ-sĭk″ū-lŏ-tĭm-păn′ĭk) [″ + Gr. *tympanon,* drum] Having both vesicular and tympanic qualities.

Vespidae (vĕs′pĭ-dē) [L. *vespa,* wasp] Family of wasps, including paper wasps, hornets, and yellow jackets.

Vespula vulgaris (vĕs′pūl-ă vūl-gār′ĭs) [NL., common (little) wasp] The scientific name for the yellow jacket. The yellow jacket is a black-and-yellow-striped stinging wasp whose venom, abbreviated *Ves v* by the World Health Organization, may cause anaphylaxis in susceptible individuals.

vessel (vĕs′ĕl) [O.Fr. from L. *vascellum,* a little vessel] A tube, duct, or canal to convey the fluids of the body. SYN: *vas*.

absorbent v.'s The lacteals and capillaries of the small intestine.

blood v. Any of the vessels carrying blood (i.e., arteries, veins, and capillaries).

chyliferous v. Lacteal (2).

collateral v. A vessel parallel to the vessel from which it arose.

conduit v. One of the large blood vessels that conducts fluid from the heart to the systemic circulation. The elasticity of these vessels is an important factor in the development of hypertension.

great v. One of the large blood vessels entering and leaving the heart.

lacteal v. Lacteal (2).

lymphatic v. A thin-walled vessel that conveys lymph from the tissues. These vessels resemble veins in structure, possessing three layers (intima, media, and adventitia) and paired valves.

nutrient v. One of the vessels supplying specific areas such as the interior of bones.

radicular v. A branch of a vertebral artery supplying a cranial nerve root.

vestibular (vĕs-tĭb′ū-lăr) [L. *vestibulum,* vestibule] Pert. to a vestibule.

vestibular area Fundus of the internal auditory meatus.

vestibular bulb One of the two sacculated collections of veins, lying on either side of the vagina beneath the bulbocavernosus muscle, connected anteriorly by the pars intermedia, and through this strip of cavernous tissue communicating with the erectile tissue of the clitoris. The vestibular bulbs are the homologues of the male corpus spongiosum. Injury during labor may give rise to troublesome bleeding. SEE: *Bartholin's gland; vagina; vestibule of vagina*.

vestibular nerve A main division of the acoustic or eighth cranial nerve; arises in the vestibular ganglion and is concerned with equilibrium.

vestibule (vĕs′tĭ-būl) A small space or cavity at the beginning of a canal, such as the aortic vestibule.

aortic v. The part of the left ventricle of the heart just below the aortic valve.

buccal v. The part of the oral cavity bounded by the teeth, gingiva, and alveolar processes and laterally by the cheek.

v. of ear The middle part of the inner ear, behind the cochlea, and in front of the semicircular canals; it contains the utricle and saccule.

v. of larynx The portion of the larynx above the vocal cords.

v. of mouth The part of the oral cav-

ity between the lips and cheeks, and the teeth and gums.

v. of nose The anterior part of the nostrils, containing the vibrissae.

v. of pharynx The space surrounded by the soft palate, base of the tongue, and the palatoglossal and palatopharyngeal arches.

v. of vagina An almond-shaped space between the lines of attachment of the labia minora. The clitoris is situated at the superior angle; the inferior boundary is the fourchette. The vestibule is approx. 4 to 5 cm long and 2 cm in greatest width when the labia minora are separated. Four major structures open into the vestibule: the urethra anteriorly, the vagina into the midportion, and the two secretory ducts of the glands of Bartholin laterally. The mucous membrane is stratified squamous epithelium. SEE: *Bartholin's gland; vagina; vestibular bulb*.

vestibuloplasty (vĕs-tĭb′ū-lō-plăs″tē) [″ + Gr. *plassein,* to mold] Plastic surgery of the vestibule of the mouth.

vestibulotomy (vĕs-tĭb″ū-lŏt′ō-mē) [″ + Gr. *tome,* incision] Surgical incision into the vestibule of the inner ear.

vestibulourethral (vĕs-tĭb″ū-lō-ū-rē′thrăl) [″ + Gr. *ourethra,* urethra] Rel. to the vestibule of the vagina and urethra.

vestibulum (vĕs-tĭb′ū-lŭm) *pl.* **vestibula** [L.] Vestibule.

vestige (vĕs′tĭj) [L. *vestigium,* footstep] A small degenerate or incompletely developed structure that has been more fully developed in the embryo or in a previous stage of the species.

vestigial (vĕs-tĭj′ē-ăl) Of the nature of a vestige. SYN: *rudimentary*.

vestigium (vĕs-tĭj′ē-ŭm) *pl.* **vestigia** [L., a footstep] Vestige.

veterinarian (vĕt″ĕr-ĭ-nār′ē-ăn) One who is trained and licensed to practice veterinary medicine and surgery.

veterinary (vĕt′ĕr-ĭ-nār″ē) **1.** Pert. to animals, their diseases, and their treatment. **2.** A veterinarian.

VF *ventricular fibrillation; vocal fremitus.*

V.H. *viral hepatitis.*

via (vē′ă, vī′ă) *pl.* **viae** [L.] Any passage in the body such as nasal, intestinal, or vaginal.

viability (vī″ă-bĭl′ĭ-tē) [L. *vita,* life, + *habilis,* fit] The capacity for living, growing, developing, or surviving. It is used, for example, in reference to a premature fetus once it reaches a certain size or gestational age, or in determining the likelihood that an injured limb or transplanted organ will survive or flourish. **viable,** *adj.*

Viagra The trade name for sildenafil citrate, a medication used for erectile dysfunction. Its use is contraindicated in patients taking nitrates in any form owing to the risk of death.

vial (vī′ăl) [Gr. *phiale,* a drinking cup] A small glass bottle for medicines or chemicals.

multiple-dose v. A container that holds more than one dose of a medication.

CAUTION: Contamination of multiple-dose vials may occur when health care providers fail to follow standard precautions or sterile procedures. Multiple-dose vials should be stored at temperatures specified by the manufacturer or pharmacist and be discarded when or if contamination is suspected or after the expiration date on the vial.

single-dose v. A container that holds enough medication for one patient's immediate needs. Single-dose vials should not be reused or refilled.

viator (vī′ă-tŏr) An individual, usually one with a terminal illness, who sells rights to his or her insurance policy in exchange for an antemortem benefit collection.

vibex (vī′bĕks) *pl.* **vibices** [L. *vibix,* mark of a blow] A narrow linear mark of hemorrhage into the skin.

vibration (vī-brā′shŭn) **1.** A to-and-fro movement. SYN: *oscillation*. **2.** Therapeutic shaking of the body, a form of massage. It consists of a quick motion of the fingers or the hand vertical to the body or use of a mechanical vibrator. Chest wall vibration is a component of pulmonary hygiene; it improves respiratory function in patients with chronic obstruction lung disease, and can be used as an adjunctive treatment for pneumonia when it is used with postural drainage.

vibrative (vīb′ră-tĭv) **1.** Vibratory. **2.** Indicating sound produced by vibration of parts of the respiratory tract as air passes through.

vibrator (vī′brā-tor) [L. *vibrator,* a shaker] A device that produces rapid to-and-fro movements in the body or one of its parts. In health care, vibrators are used in hearing aids and middle ear implants; in pulmonary hygiene to assist in clearing secretions or to stimulate diaphragmatic movement; in patients with sexual dysfunction (e.g., patients with spinal cord injuries affecting orgasm, or other orgasmic difficulties); or in the relief of muscle contraction in some patients with neurological deficits.

whole body v. Exposure of the entire body to vibration as would occur in occupations such as truck and tractor drivers, jackhammer operators, helicopter pilots, and construction workers using various vibration-producing tools. Such exposure may produce diseases of the peripheral nerves, prostatitis, and back disorders.

vibratory (vī′bră-tō″rē) [L. *vibrator,* a shaker] Having a vibrating or oscillatory movement.

vibratory sense The ability to perceive vibrations transmitted through the skin to deep tissues; usually tested by placing a vibrating tuning fork over bony prominences.

Vibrio (vĭb′rē-ō) A genus of curved, motile, gram-negative bacilli, several of which may be pathogenic for humans.

V. cholerae The causative agent of cholera.

v. parahaemolyticus A marine vibrio, a common cause of gastroenteritis involving raw or poorly cooked seafood.

V. vulnificus A marine vibrio that may cause fulminant gangrene if it contaminates wounds or may cause fatal septicemia if ingested by those with impaired gastric, liver, kidney, or immune function. The usual source in such cases is raw shellfish.

vibrio (vĭb′rē-ō) *pl.* **vibriones** An organism of the genus *Vibrio.* SEE: *bacteria* for illus.

vibriocidal (vĭb″rē-ō-sī′dăl) Destructive to vibrio organisms.

vibrion (vē″brē-ŏn′) [Fr.] A vibrio.

vibriosis (vĭb″rē-ō′sĭs) Infection with bacteria of the genus *Vibrio.*

vibrissae (vī-brĭs′ē) *sing.,* **vibrissa** [L. *vibrissa,* that which shakes] Stiff hairs within the nostrils at the anterior nares.

vibromassage (vī″brō-mă-săj′) A massage in which a mechanical vibrator is used.

vibrometer (vī-brŏm′ĕt-ĕr) [L. *vibrare,* to shake, + Gr. *metron,* measure] A device used to measure the vibratory sensation threshold. It is particularly useful in judging the progression or remission of peripheral neuropathy.

vicarious (vī-kā′rē-ŭs) [L. *vicarius,* change, alternation] Acting as a substitute; pert. to assumption of the function of one organ by another.

vicarious learning Learning through indirect experience.

Vicq d'Azyr's tract (vĭk dă-zērz′) [Felix Vicq d'Azyr, Fr. anatomist, 1748–1794] A large myelinated bundle arising in mammillary nuclei and terminating in the anterior thalamic nuclei of the brain.

vidarabine (vī-dār′ă-bēn) An antiviral agent effective against the herpes simplex and herpes zoster–varicella viruses.

video-assisted Facilitated by live televised images; used for certain surgical techniques.

video display terminal ABBR: VDT. A terminal used in information processing (computer terminal) and entertainment (TV picture tube) that produces an image on a screen (target) by bombarding it with electrons. This causes the fluorescent material that coats the screen to emit light. The effects on workers involved with the use of VDTs have been investigated with respect to a variety of factors. There is no evidence that reproductive or visual health is impaired by working with VDTs. Those who work with VDTs may experience musculoskeletal difficulties if the workplaces are poorly designed. This may be due to the screen being positioned in a way that promotes poor posture, or the chair being of improper design. SEE: *ergonomics*.

videognosis (vĭd″ē-ŏg-nō′sĭs) [L. *videre,* to see, + Gr. *gnosis,* knowledge] Diagnosis using data and radiographic images transmitted by the use of television.

video-stroboscope A closed-circuit television recording technique used to obtain images while the field is illuminated by use of a stroboscope. Using this provides sequential views of objects in motion.

vidian artery (vĭd′ē-ăn) [Guido Guidi (L. *Vidius*), It. physician, 1500–1569] The artery passing through the pterygoid canal.

vidian nerve A branch from the sphenopalatine ganglion.

view Projection.

view box A device made of lights placed behind a translucent screen that is used to provide backlighting for a radiographic image. It helps clinicians see the brightness, contrast, and details of an image.

vigil (vĭj′ĭl) [L., awake] Insomnia, wakefulness.

coma v. A delirious, drowsy state in which the patient is partially conscious and occasionally responsive to stimuli. SEE: *vigilambulism*.

vigilambulism (vĭj″ĭl-ăm′bū-lĭzm) [″ + *ambulare,* to walk, + Gr. *-ismos,* condition] Automatism that occurs while the person is awake; resembles somnambulism.

vigilance (vĭj′ĭ-lăns) [L. *vigilantia,* wastefulness] The condition of being attentive, alert, and watchful.

vigintinormal (vī-jĭn″tĭ-nor′măl) [L. *viginti,* twenty, + *normal,* rule] Consisting of one twentieth of what is normal, as a solution.

vignetting (vĭn-yĕt′ĭng) In radiology, a loss in brightness and focus toward the periphery of the output phosphor during image intensification.

vigor (vĭg′or) [L.] Active force or strength of body or mind.

Villaret's syndrome (vē-lăr-āz′) [Maurice Villaret, Fr. neurologist, 1877–1946] Ipsilateral paralysis of the 9th, 10th, 11th, 12th, and sometimes the 7th cranial nerves and the cervical sympathetic fibers. It is caused by a lesion in the posterior retroparotid space. The signs and symptoms include paralysis

and anesthesia of the pharyngeal area with difficulty swallowing; loss of taste sensation in the posterior third of the tongue; paralysis of the vocal cords, and the sternocleidomastoid and trapezius muscles; and Horner's syndrome.

villi (vĭl′ī) [L.] Pl. of villus.

villiferous (vĭl-ĭf′ĕr-ŭs) [″ + *ferre,* to bear] Having villi or tufts of hair.

villoma (vĭ-lō′mă) [L. *villus,* tuft of hair, + Gr. *oma,* tumor] A villous tumor.

villose, villous (vĭl′ōs, vĭl′ŭs) [L. *villus,* tuft of hair] Pert. to or furnished with villi or with fine hairlike extensions.

villositis (vĭl″ōs-ī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of the placental villi.

villosity (vĭ-lŏs′ĭ-tē) The condition of being covered with villi.

villus (vĭl′ŭs) *pl.* **villi** [L., tuft of hair] A small fold or projection of some mucous membranes.

arachnoid v. Arachnoid granulation.

chorionic v. One of the tiny vascular projections of the chorionic surface that become vascular and help to form the placenta. SEE: *embryo* for illus.; *chorion*.

intestinal v. One of the multiple, minute projections of the intestinal mucosa into the lumen of the small intestine. These projections increase the surface area for absorption of water and nutrients; each contains a capillary network and a lacteal. SEE: illus.

synovial v. One of the thin projections of the synovial membrane into the joint cavity.

villusectomy (vĭl″ŭs-ĕk′tō-mē) [″ + Gr. *ektome,* excision] Surgical removal of a synovial villus.

vinblastine sulfate (vĭn-blăs′tēn) A fraction of an extract obtained from the periwinkle plant, *Vinca rosea,* a species of myrtle. It is a cytotoxic agent used in treating certain types of malignant tumors.

CAUTION: Like other cytotoxic drugs, vinblastine should be handled with barriers to protect the administrator. It must be disposed of in environmentally sound containers.

Vinca (vĭn′kă) A genus of herbs including periwinkles, from which vincristine and vinblastine are obtained.

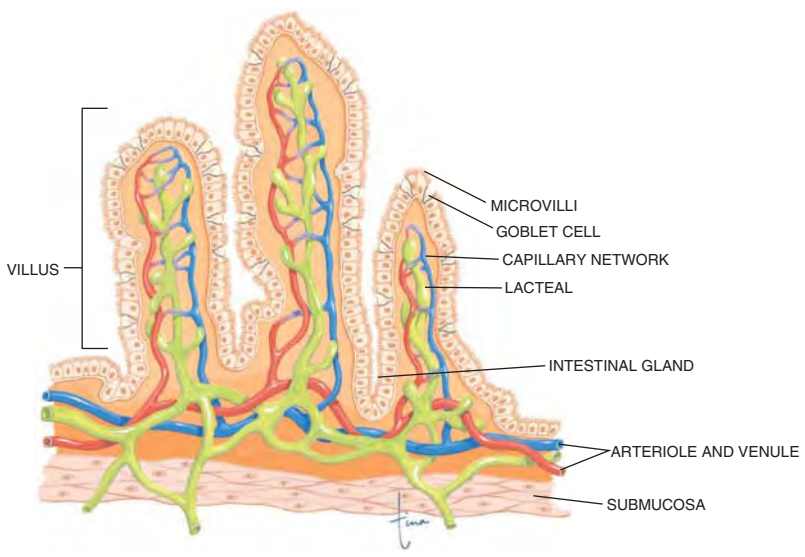
Vincent's angina (vĭn′sĕnts) Necrotizing ulcerative gingivitis.

vincristine sulfate (vĭn-krĭs′tēn) A fraction of an extract obtained from the periwinkle plant, *Vinca rosea,* a species of myrtle. It is a cytotoxic agent used in treating certain types of malignant tumors.

CAUTION: Like other cytotoxic drugs, vincristine should be handled with barriers to protect the administrator. It must be disposed of in environmentally sound containers.

vinculum (vĭn′kū-lŭm) *pl.* **vincula** [L., to bind, tie] A uniting band or bundle. SYN: *frenulum; frenum; ligament*.

v. tendinum **1.** Slender tendinous fil-



VILLI OF SMALL INTESTINE

aments connecting the phalanges with the flexor tendons. **2.** The ringlike ligament of the ankle or wrist.

vinegar (vĭn′ĕ-găr) [ME. *vinegre,* from Fr. *vin,* wine, + *aigre,* sour] An impure solution containing 4% to 6% acetic acid. It is the product of fermentation of weak alcoholic solutions such as apple cider. SEE: *condiment*.

vinyl (vī′nĭl) The univalent ethenyl hydrocarbon molecule, CH_2═CH—.

v. chloride A vinyl radical attached to a chlorine atom, CH_2═CHCl. It is used commercially to make pipes, tubing, and plastic resin. Some individuals exposed to vinyl chloride have developed hepatic angiosarcoma.

v. cyanide A toxic liquid compound, CH_2═CHCN, used in making plastics. SYN: *acrylonitrile*.

v. ether An anesthetic agent that is virtually obsolete because it is explosive or flammable in the concentration required to produce anesthesia.

violaceous (vī″ĕ-lā′shŭs) [L. *violaceus,* violet] Having a purple discoloration, esp. of the skin.

violate (vī′ĕ-lāt″) [L. *violare,* to injure] To harm or injure a person, esp. to rape a female.

violence (vī′ō-lĕnts) [L. *violentia*] **1.** The use of force or physical compulsion to abuse or damage. Interpersonal violence among children and young adults rose to epidemic levels in the U.S. in the 1990s. Known risk factors for interpersonal violence among young people include a previous history of violence, rejection by others, academic underachievement, and parental difficulties (or having parents with a history of antisocial behavior). **2.** The act of violent behavior.

domestic v. Abuse or neglect occurring within families. Types of domestic violence include child abuse, spouse abuse, elder abuse, sexual abuse, marital rape, and lapses in household firearm safety.

intimate partner v. Physical, sexual, or verbal abuse of a spouse or sexual partner.

perinatal v. Abuse or assault of women just before or after childbirth.

risk for v., directed at others Behaviors in which an individual demonstrates that he or she can be physically, emotionally, or sexually harmful to others. SEE: *Nursing Diagnoses Appendix.*

risk for v., directed at self Behaviors in which an individual demonstrates that he or she can be physically, emotionally, or sexually harmful to the self. SEE: *Nursing Diagnoses Appendix.*

violet (vī′ō-lĕt) [ME. *violett,* from L. *viola,* violet] One of the colors of the visible spectrum; similar to purple.

gentian v. $C_{25}H_{30}ClN_3$; a dye derived from coal tar that is widely used as a stain in histology, cytology, and bacteriology. It has also been used therapeutically as a topical anti-infective. Its chemical name is hexamethylpararosaniline chloride.

viosterol (vī-ŏs′tĕr-ōl) A solution of irradiated ergosterol in vegetable oil. SYN: *calciferol*.

viper (vī′pĕr) Any venomous snake of the family Viperidae.

VIPoma (vī-pō′mă) [*v*asoactive *i*ntestinal *p*olypeptide + *oma,* tumor] A rare form of neuroendocrine tumor that causes watery diarrhea, hypokalemia, and achlorhydria as a result of the release of vasoactive intestinal peptide.

viral (vī′răl) Pert. to or caused by a virus.

viral interference The inhibition of the multiplication of one type of virus by the presence of another virus in the same cell. SEE: *interferon*.

viral load A measure of the total body burden of viral particles present in human blood; the greater the number, usually, the sicker the patient. Testing for viral loads has aided the treatment of several illnesses, including AIDS and hepatitis C. In these illnesses, antiviral therapies are initiated at certain levels of viral load and continued if anticipated reductions in viremic burden are achieved.

viral set point The balance in a viral infection between the number of viruses in the blood (the "viral load") and the response by the immune system to initial infection. It may be one of the predictors of disease progression in illnesses such as human immunodeficiency virus (HIV) infection.

Virchow's node (fir′kōz) Node, sentinel.

viremia (vī″rēm′ē-ă) The presence of viruses in the blood.

vires (vī′rēs) Pl. of vis.

virga (vĭr′gă) [L., a rod] Penis.

virgin (vĕr′jĭn) [L. *virgo,* a maiden] **1.** A woman or man who has not had sexual intercourse. **2.** Uncontaminated; fresh; new.

virginal (vĕr′jĭn-ăl) [L. *virgo,* a maiden] Rel. to a virgin or to virginity.

virginity (vĕr-jĭn′ĭt-ē) [L. *virginitas,* maidenhood] The state of being a virgin; not having experienced sexual intercourse.

virile (vĭr′ĭl) [L. *virilis,* masculine] Masculine.

virile reflex **1.** The sudden downward movement of a completely relaxed penis when the prepuce or glans is pulled upward. SYN: *bulbocavernosus reflex*. **2.** The contraction of the bulbocavernous muscle on percussing the dorsum of the penis. **3.** The contraction of the bulbocavernous muscle resulting from compression of the glans penis.

virilescence (vĭr-ĭl-ĕs′ĕns) [L. *virilis,* masculine] The acquisition of second-

ary masculine characteristics in the female.

virilia (vĭr-ĭl′ē-ă) [L.] The male sexual organs.

virilism (vĭr′ĭl-ĭzm) [″ + Gr. *-ismos,* condition] The presence or development of male secondary characteristics in a woman.

virility (vĭr-ĭl′ĭ-tē) [L. *virilitas,* masculinity] **1.** The state of possessing masculine qualities. **2.** Sexual potency in the male.

virilization (vĭr″ĭ-lī-zā′shŭn) The production of masculine secondary sex changes in a woman. Included would be voice change, development of male-type baldness, clitoral enlargement, and increased growth of facial and body hair. Virilization may be caused by one of several endocrine diseases that lead to excess production of testosterone, or by the woman's taking anabolic steroids. In the latter case, this is often done to attempt to enhance muscular development.

virion (vī′rē-ŏn, vĭ′rē-ŏn) A complete virus particle; a unit of genetic material, the genome, surrounded by a protective protein coat, the capsid. Sometimes the capsid is surrounded by a lipid envelope. SYN: *particle(4);*. SEE: *capsid*.

viripotent (vī-rĭp′ō-tĕnt) [L. *viripotens*] Sexually mature, as applied to a man.

viroid (vī′royd) A small, naked, infectious molecule of RNA. Viroids differ from viruses by the absence of a dormant phase and by genomes that are much smaller than those of known viruses.

virology (vī-rŏl′ō-jē) [L. *virus,* poison, + Gr. *logos,* word, reason] The study of viruses and viral diseases.

viropexis (vī″rō-pĕk′sĭs) [″ + Gr. *pexis,* fixation] The fixation of a virus particle to a cell. This leads to the inclusion of the virus inside the cell.

virtual (vĕr′tū-ăl) [L. *virtus,* capacity] Appearing to exist but not existing in actual fact or form.

virucidal (vĭr-ū-sī′dăl) [L. *virus,* poison, + *cidus,* to kill] Destructive of a virus.

virucide (vĭr′ū-sīd) An agent that destroys or inactivates a virus, esp. a chemical substance used on living tissue.

virulence (vĭr′ū-lĕns) [LL. *virulentia,* stench] **1.** The relative power and degree of pathogenicity possessed by organisms. Properties that influence the virulence of an organism include 1. the strength of its adhesion molecules, which link it to the target cell; 2. its ability to secrete enzymes or exotoxins that damage target cells, or endotoxins that interfere with the body's normal regulatory systems; and 3. its ability to inhibit or evade the actions of white blood cells and their chemical mediators. SEE: *immunocompetence; immunocompromised*. **2.** The property of being virulent; venomousness, as of a disease. SEE: *attenuation*.

virulent (vĭr′ū-lĕnt) [L. *virulentus,* poison] **1.** Very poisonous. **2.** Infectious; able to overcome the host's defensive mechanism.

viruria (vīr-ūr′ē-ă) [″ + Gr. *ouron,* urine] The presence of viruses in the urine.

virus (vī′rŭs) [L., poison] A pathogen made of nucleic acid inside a protein shell, which can grow and reproduce only after infecting a host cell. More than 400 types of viruses that cause a great variety of illness are known. All of them can attach to cell membranes, enter the cytoplasm, take over cellular functions, reproduce their parts, and assemble themselves into mature forms capable of infecting other cells.

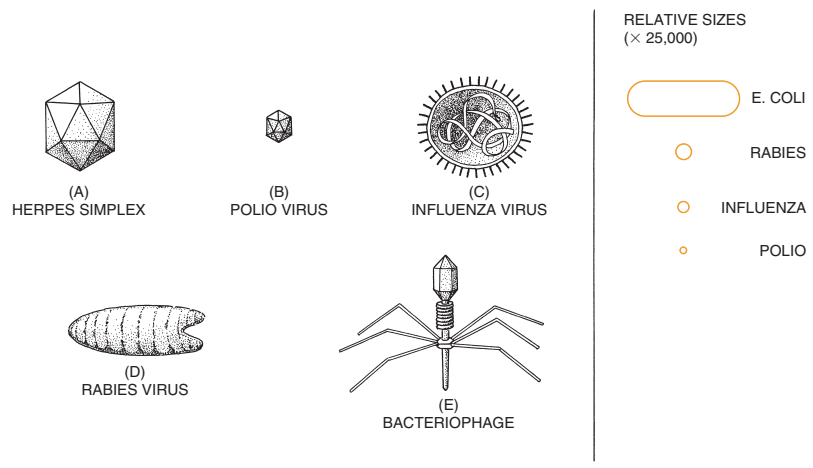
Some of the most virulent agents known are viruses (e.g., the hemorrhagic fever caused by Ebola virus). Viruses are also responsible for the common cold, childhood exanthems (chickenpox, measles, rubella), latent infections (herpes simplex), some cancers or lymphomas (Epstein-Barr virus), and diseases of virtually any organ system of the body.

Viruses with lipid envelopes have a greater ability to adhere to cell membranes and to avoid destruction by the immune system. Both the capsid and envelope are antigenic, i.e., are recognized as foreign by white blood cells. Frequent mutations change some viral antigens, so the lymphocytes are unable to create an antibody that can neutralize both the original antigen and its replacement. The common influenza viruses have antigens that mutate or combine readily, requiring new vaccines with each mutation. The body's primary immune defenses against viruses are cytotoxic T lymphocytes, interferons, and to some extent immunoglobulins; destruction of the virus often requires destruction of the host cell.

When viruses enter a cell, they may immediately trigger a disease process or remain quiescent for many years. They damage the host cell by blocking its normal protein synthesis and using its metabolic machinery for their own reproduction. New viruses are then released either by destroying their host cell or by forming small buds that break off and infect other cells. SEE: illus.; table.

CLASSIFICATION: The 400 known viruses are classified in several ways: by genome core (RNA or DNA), host (animals, plants, or bacteria), method of reproduction (e.g., retrovirus), mode of transmission (e.g., enterovirus), and disease produced (e.g., hepatitis virus).

TREATMENT: Antiviral drugs in-



VIRUSES

clude such agents as acyclovir (for herpes simplex); amantadine and rimantadine (for influenza A); interferons (for chronic hepatitis B and C); ribavirin (for respiratory syncytial virus and chronic hepatitis C); and lamivudine (among many others, for human immunodeficiency virus [HIV]).

attenuated v. A virus with reduced pathogenicity due to treatment or repeated passage through hosts.

B v. *Cercopithecine herpesvirus* 1.

bacterial v. Bacteriophage.

chikungunya v. An alphavirus, typically found in Africa or Southeast Asia, that can be transmitted to humans by the bite of *Aedes* mosquitoes. After an incubation period of about a week, the virus produces high fevers, headache, nausea, vomiting, and severe joint pain, usually in the wrists or ankles.

cowpea mosaic v. A plant virus that has been used in vaccine development to deliver antigens from pathogens and tumors. Because the virus does not infect animals, it is considered a safe vehicle for antigen display in humans and other species.

coxsackie v. SEE: *coxsackievirus*.

cytomegalic v. ABBR: CMV. Cytomegalovirus.

defective v. A virus particle that, be-

Common Viral Characteristics

Characteristics	Examples
Genetic material	
RNA	HIV, hepatitis A, polio, measles, mumps, rhinovirus, influenza
DNA	Herpesviruses, hepatitis B, adenoviruses, human papilloma viruses, cytomegalovirus
Hosts	
Humans	Measles, mumps, rubella, varicella-zoster, poliovirus
Humans and animals	Rabies, influenza, hantavirus, encephalitis virus
Plants	Tobacco mosaic virus, cowpea mosaic virus
Bacteria	Phages
Envelope	
Present	Herpesviruses, rabies, HIV
Absent	Rotavirus, Norwalk virus, adenovirus
Respiratory	Influenza, parainfluenza, hantavirus
Teratogenic	Herpes varicella, cytomegalovirus, rubella
Neurological and fatal	Rabies
Paralytic encephalitic	Polio, many encephalitis viruses
Fulminant	Yellow fever, hantavirus, Ebola-Marburg
Latent	Herpesviruses
Cancer causing	Human T-cell lymphotrophic virus, hepatitis viruses, papillomavirus

cause of a lack of certain essential factors, is unable to replicate. Sometimes this can be overcome by the presence of a helper virus that provides the missing factor or factors.

DNA v. A virus such as the papilloma virus and the herpesviruses whose genome is deoxyribonucleic acid (DNA).

EB v. Epstein-Barr virus.

enteric v. Enterovirus.

enteric cytopathogenic human orphan v. ABBR: ECHO virus. A virus that was accidentally discovered in human feces and not known to be associated with a disease, thus the name "orphan." Initially 33 ECHO virus serotypes were designated, but numbers 10 and 28 have been reclassified. Various serotypes have been associated with aseptic meningitis, encephalitis, acute upper respiratory infection, enteritis, pleurodynia, and myocarditis.

enteric orphan v. SEE: *enteric cytopathogenic human orphan v.*

filtrable v. A virus causing infectious disease, so small it retains infectivity after passing through a filter of the Berkefeld type. SEE: *filter, Berkefeld*.

fixed v. A rabies virus that was stabilized and modified but only partially attenuated by serial passage through rabbits.

foamy v. Spumavirus.

GB v. type C Hepatitis G virus.

Guanarito v. An arenavirus (from the Tacaribe virus group) that chronically infects rodents. It is the cause of sporadic outbreaks of Venezuelan hemorrhagic fever.

helper v. A virus that permits a defective virus present in the same cell to replicate. SEE: *defective v.*

hepatitis G v. An RNA flavivirus found in blood in about 2% of blood donors that may be transmitted by injection drug abuse, sexual contact, transfusions, and childbirth (from mother to infant). It is remotely related to hepatitis C virus. It causes chronic viremia, but does not seem to cause hepatitis or liver damage. SYN: *GB virus type C*.

herpes v. Herpesviruses.

human immunodeficiency v. ABBR: HIV. SEE: *human immunodeficiency virus*.

JC v. A DNA papovavirus that causes progressive multifocal leukoencephalopathy in immunosuppressed patients. It is carried asymptomatically by a large percentage of the population.

Junin v. An arenavirus that chronically infects rodents. It is the cause of sporadic outbreaks of Argentine hemorrhagic fever, a potentially lethal infection usually found in South America.

latent v. A virus that has the ability to infect the host, initially causing little or no evidence of illness but persisting for the lifetime of the infected individual; later on, a specific triggering mechanism may cause the virus to produce a clinically apparent disease. This occurs with herpes simplex virus that remains latent in sensory ganglia and is reactivated by trauma to the skin supplied by the distal sensory nerves associated with these ganglia. After reactivation, the virus may cause localized or generalized lesions in the affected area and the central nervous system.

lytic v. Any virus that, after infecting a cell, lyses it.

masked v. A virus that ordinarily occurs in the host in a noninfective state but is activated and demonstrated by indirect methods.

neurotropic v. A virus that reproduces in nerve tissue.

Nipah v. ABBR: NiV. A member of the family of paramyxoviruses that can cause outbreaks of encephalitis and respiratory disease in humans. It is transmitted to humans from infected swine (e.g., in slaughterhouses).

Norwalk v. [virus first identified in Norwalk, Ohio, U.S.A] ABBR: NLV. A calicivirus that is the causative organism in over half of the reported cases of epidemic viral gastroenteropathy. The incubation period ranges from 18 to 72 hr. The outbreaks are usually self-limiting and the intestinal signs and symptoms last for 24 to 48 hr. Treatment, if required, is supportive and directed to maintaining hydration and electrolyte balance. SYN: *Norwalk agent*. SEE: *Calicivirus*.

Oliveros v. An arenavirus of the Tacaribe complex of viruses that normally infects rodents in the pampas of Argentina. It may cause a fatal hemorrhagic fever in humans.

oncogenic v. Tumor virus.

Onyong-nyong v. An alphavirus (family Togaviridae) found in central Africa that causes epidemic fevers, joint pains, and swollen glands. The virus is transmitted to humans by mosquito bite.

orphan v. One of several viruses that initially were not thought to be associated with human illness. This group includes the enteroviruses and rhinoviruses.

parainfluenza v. One of a group of viruses that affect infants and young children. It causes respiratory infections that may be mild or may progress to pneumonia. Most infections are so mild as to be clinically inapparent.

plant v. Any virus that is pathogenic for plants.

pox v. Poxvirus.

reassortant v. A virus whose genetic material has been recombined or reshuffled so that it contains new nucleic acid sequences, new antigenic struc-

tures, and new combinations of protein products.

respiratory syncytial v. A virus that is a major cause of lower respiratory tract disease during infancy and early childhood. It induces the formation of cell masses in which the cytoplasm of cells merges into a syncytium. Attempts to develop an effective and safe vaccine have been unsuccessful so far. Because it is difficult to recognize the disease early and inapparent cases are frequent, isolation and public health measures are not adequate to control the spread of the disease. Ribavirin is the primary drug used in its treatment. The administration of high doses of respiratory syncytial virus immune globulin is an effective means of preventing lower respiratory tract infection in infants and young children at high risk for contracting this disease.

Rift Valley v. A phlebovirus that causes sporadic epidemics among both humans and animals of hemorrhagic fever, in Africa. It is transmitted by the bite of infected mosquitoes.

RNA v. A virus such as the human immunodeficiency virus, influenza virus, and polio virus whose genome is ribonucleic acid (RNA).

sandfly fever v. Toscana v.

Sindbis v. An alphavirus typically found in South Africa or Oceania that is disseminated to humans by mosquitoes of the genus *Culex*. It can cause a transient febrile illness accompanied by a diffuse maculopapular rash and muscle and joint pains.

slow v. A virus that replicates and causes disease indolently. SEE: *slow v. infection*.

slow v. infection An infection caused by a virus that remains dormant in the body for a prolonged period before causing signs and symptoms of illness. Such viruses may require years to incubate before causing diseases. Examples include progressive multifocal leukoencephalopathy and subacute sclerosing panencephalitis.

street v. A rabies virus obtained from an infected animal rather than from a laboratory strain.

SV 40 v. Simian virus 40, which is a member of the papovavirus family. The virus produces sarcomas after subcutaneous inoculation into newborn hamsters.

Tacaribe complex v. A group of viruses, originally identified in South America, that cause hemorrhagic fever in humans. They are members of the arenavirus family and are typically found in rodents. One member of this group is the Sabia virus.

Toscana v. A Bunyavirus transmitted by insect bite, esp. the bite of the sandfly (*Phlebotomus papatasi*). The virus is endemic in Sicily, Cyprus, and other Mediterranean locations and may cause encephalitis, aseptic meningitis, or septicemia. SYN: *sandfly fever virus*.

transfusion-transmissible v. ABBR: TTV. A single-stranded DNA virus, found in recipients of blood transfusions, that colonizes in the liver. It is not known whether the virus causes liver disease, e.g., chronic hepatitis, or benignly colonizes the liver.

tumor v. A virus that causes malignant neoplasms. Viruses suspected of causing tumors in humans include Epstein-Barr virus (associated with Burkitt's lymphoma), hepatitis B virus (with hepatocellular carcinoma), papilloma virus (with carcinoma of the cervix), and human herpesvirus 8 (with Kaposi's sarcoma). SYN: *oncogenic virus*.

vaccinia v. A double-stranded DNA virus, the causative agent of cowpox and a member of the Orthopoxvirus family. Vaccines against smallpox are derived from live cultures of vaccinia virus. SEE: *Orthopoxvirus*.

West Nile v. An arbovirus which primarily infects birds, but which can be transmitted by mosquito bite to humans and other animals. It may cause mild or severe encephalitis or aseptic meningitis. Common signs and symptoms include fever, headache, stiff neck, and muscular weakness. Infection is occasionally fatal.

In 2002, more than 4000 cases (274 fatalities) were reported from 38 states in the US and Canada. The disease has long been endemic in the Middle East. SEE: illus.

WEST NILE VIRUS
The Culex mosquito, vector of West Nile Virus

virusemia (vī″rŭs-ēm′ē-ă) [″ + Gr. *haima,* blood] Viremia.

virus shedding The release of a virus from the host.

virustatic (vīr″ŭ-stăt′ĭk) [″ + Gr. *statikos,* bringing to a standstill] Stopping the growth of viruses.

vis (vĭs) *pl.* **vires** [L., strength] Force, strength, energy, power.

viscera (vĭs′ĕr-ă) *sing.,* **viscus** [L.] Internal organs enclosed within a cavity,

esp. the abdominal organs. SEE: *celosomia; evisceration; splanchnic*.

viscerad (vĭs′ĕr-ăd) [″ + *ad,* toward] Toward the viscera.

visceral (vĭs′ĕr-ăl) [L. *viscera,* body organs] **1.** Pert. to viscera. **2.** Pert. to or derived from the gill arches of vertebrates.

visceral cleft One of the fissures separating the visceral arches.

visceral efferent system An out-of-date term for the autonomic nervous system. SEE: *autonomic nervous system*.

visceral skeleton The pelvis, ribs, and sternum enclosing the viscera.

viscero- (vĭs′ĕr-ō) [L. *viscera,* body organs] Combining form meaning *viscera.*

visceroceranium (vĭs″ĕr-ō-krā′nē-ŭm) That portion of the skull derived from the pharyngeal arches.

viscerogenic (vĭs″ĕr-ō-jĕn′ĭk) [″ + Gr. *gennan,* to produce] Originating in the viscera.

visceroinhibitory (vĭs″ĕr-ō-ĭn-hĭb′ĭ-tō-rē) [″ + *inhibere,* to restrain] Checking the action of the viscera.

visceromegaly (vĭs″ĕr-ō-mĕg′ă-lē) [″ + Gr. *megalos,* great] Generalized enlargement of the abdominal visceral organs.

visceromotor (vĭs″ĕr-ō-mō′tor) [L. *viscera,* body organs, + *motor,* a mover] Rel. to a nerve conveying motor impulses to the viscera. SYN: *viscerimotor*.

visceroparietal (vĭs″ĕr-ō-pă-rī′ĕ-tăl) [″ + *paries,* wall] Rel. to the viscera and abdominal wall.

visceroperitoneal (vĭs″ĕr-ō-pĕr″ĭ-tō-nē′ăl) [″ + Gr. *peritonaion,* peritoneum] Rel. to the abdominal viscera and peritoneum.

visceropleural (vĭs″ĕr-ō-ploo′răl) [″ + Gr. *pleura,* a side] Rel. to the thoracic viscera and pleura. SYN: *pleurovisceral*.

visceroptosis (vĭs″ĕr-ŏp-tō′sĭs) [″ + Gr. *ptosis,* a dropping] Downward displacement of a viscus.

viscероreceptors (vĭs″ĕr-ō-rē-sĕp′torz) A group of receptors that includes those located in visceral organs. Their stimulation gives rise to poorly localized and ill-defined sensations or to pain. In hollow visceral organs, they are stimulated principally by excessive contraction or by distention.

visceroreceptors (vĭs″ĕr-ō-rē-sĕp′torz) A group of receptors that includes those located in visceral organs. Their stimulation gives rise to poorly localized and ill-defined sensations or to pain. In hollow visceral organs, they are stimulated principally by excessive contraction or by distention.

visceroreceptors (vĭs″ĕr-ō-rē-sĕp′torz) A group of receptors that includes those located in visceral organs. Their stimulation gives rise to poorly localized and ill-defined sensations or to pain. In hollow visceral organs, they are stimulated principally by excessive contraction or by distention.

viscerosensory (vĭs″ĕr-ō-sĕn′sō-rē) [″ + *sensorius,* sensory] Pert. to sensations aroused by stimulation of visceroreceptors.

viscerosensory reflex Pain or tenderness elicited in somatic structures (skin and muscle) caused by visceral disorder. SEE: *pain, referred*.

visceroskeletal (vĭs″ĕr-ō-skĕl′ĕt-ăl) [″ + Gr. *skeleton,* a dried-up body] Rel. to the visceral skeleton.

viscerosomatic (vĭs″ĕr-ō-sō-măt′ĭk) [″ + Gr. *soma,* body] Rel. to the viscera and the rest of the body.

viscerosomatic reaction A reaction occurring in muscles of the body wall as a result of stimulation of visceroreceptors.

viscerotome (vĭs′ĕr-ō-tōm) [″ + Gr. *tome,* incision] The part of an abdominal organ that is supplied with afferent nerves from a single posterior root.

viscerotonia (vĭs″ĕr-ō-tōn′ē-ă) [″ + Gr. *tonos,* tension] Personality traits characterized by predominance of social over intellectual and physical traits. The individual is sociable and convivial, exhibits unusual appreciation of food, and loves company, affection, social support, and approval.

viscerotrophic (vĭs″ĕr-ō-trŏf′ĭk) [″ + Gr. *trophe,* nourishment] Pert. to trophic changes rel. to or associated with visceral conditions.

viscerotropic (vĭs″ĕr-ō-trŏp′ĭk) [″ + Gr. *tropos,* a turn] Primarily affecting the viscera.

viscerovisceral reaction (vĭs″ĕr-ō-vĭs′ĕr-ăl) A reaction taking place in the viscera as a result of stimulation of visceral receptors. Such reactions are usually below the level of consciousness.

viscid (vĭs′ĭd) [L. *viscum,* mistletoe, birdlime] Adhering, glutinous, sticky. In bacteriology, said of a colony that strings out by clinging to a needle that is touched to the culture and withdrawn. In a liquid culture the sediment rises in a coherent strand when the culture tube is swirled.

viscoelasticity (vĭs″kō-ē″lăs-tĭs′ĭ-tē) The property of being viscous and elastic.

viscosimeter (vĭs″kŏs-ĭm′ĕ-tĕr) [LL. *viscosus,* viscous, + Gr. *metron,* measure] A device for estimating the viscosity of a fluid, esp. of blood.

viscosimetry (vĭs″kō-sĭm′ĕ-trē) Measurement of the viscosity of a substance.

viscosity (vĭs″kŏs′ĭ-tē) [LL. *viscosus,* viscous] **1.** The state of being sticky or gummy. **2.** Resistance offered by a fluid to change of form or relative position of its particles due to attraction of molecules to each other.

specific v. The internal friction of a fluid, measured by comparing the rate of flow of the liquid through a tube with that of some standard liquid, or by measuring the resistance to rotating paddles.

viscous (vĭs′kŭs) Sticky, gummy, gelatinous, with high viscosity.

viscus (vĭs′kŭs) *pl.* **viscera** [L., body organ] Any internal organ enclosed within a cavity such as the thorax or abdomen.

visibility (vĭz″ĭ-bĭl′ĭ-tē) [L. *visibilitas*] The quality of being visible.

visible (vĭz′ĭ-bl) [L. *visibilis*] Capable of being seen.

visile (vĭz′ĭl) [L. *visum,* seeing] **1.** Pert. to vision. **2.** Readily recalling what is

seen, more than that which is audible or motile.

vision (vĭzh′ŭn) [L. *visio,* a seeing] **1.** Act of viewing external objects. SYN: *sight*. SEE: *reading machine for the blind*. **2.** Sense by which light, color, form, and contrast are apprehended. **3.** An imaginary sight.

achromatic v. Complete color blindness.

artificial v. A technique, still in the experimental stage, designed to make it possible for some persons who are blind to see as a result of electrical stimulation of the retina or the connection of digital video cameras to the visual cortex of the brain.

binocular v. The visual sensation that is produced when the images perceived by each eye are fused to appear as one.

central v. Vision resulting from light falling on the fovea centralis.

day v. A condition in which one sees better during the day than at night, found in peripheral lesions of the retina such as retinitis pigmentosa. SYN: *photopic vision*.

dichromatic v. A form of defective color vision in which only two of the primary colors are perceived.

double v. Diplopia.

field of v. The space within which an object can be seen while the eye remains fixed on one point. SEE: *perimetry*.

half v. Hemianopia.

indirect v. Peripheral v.

low v. A significant loss of vision that cannot be corrected medically, surgically, or with eyeglasses.

monocular v. Vision using only one eye.

multiple v. Polyopia.

oscillating v. Oscillopsia.

peripheral v. Vision resulting from rays falling on the retina outside of the macular field. SYN: *indirect vision*.

phantom v. An experience of visual sensations following surgical removal of an eye; usually a transient condition.

photopic v. Day vision.

scotopic v. Night vision.

stereoscopic v. Vision in which things have the appearance of solidity and relief, as though seen in three dimensions. Binocular vision produces this effect. SYN: *stereopsis*.

tunnel v. **1.** Visual acuity that is limited to the central visual field, for example, two to three degrees of visual radius. **2.** An inability to appreciate the full scope of an issue.

v. without sight The ability of individuals who are blind and unable to perceive visual stimuli including bright light, to respond to light.

visit An encounter between a patient and a health professional that requires either the patient to travel from his or her home to the professional's usual place of practice (office visit) or vice versa (home visit).

Visiting Nurse Association A voluntary health agency that provides nursing services in the home, including health supervision, education and counseling, and maintenance of the medical regimen. Nurses and other personnel such as home health aides who are specifically trained for tasks of personal bedside care provide the services offered by the agency. These agencies originated in the visiting or district nurse service provided to the poor in their homes by voluntary agencies such as the New York City Mission, which existed in the 1870s. The first visiting nurse associations were established in Buffalo, Boston, and Philadelphia between 1886 and 1887.

visual (vĭzh′ū-ăl) [L. *visio,* a seeing] **1.** Pert. to vision. **2.** One whose learning and memorizing processes are largely of a visual nature.

visual acuity SEE: under *acuity*.

visual angle The angle between the line of sight and the extremities of the object seen.

visual cone The cone whose vertex is at the eye and whose generating lines touch the boundary of a visible object.

visual evoked response ABBR: VER. A reaction produced in response to visual stimuli. While the patient is watching a pattern projected on a screen, the electroencephalogram is recorded. The characteristics of the wave form, its latency, and the amplitude of the wave can be compared with the normal, and important information concerning the function of the visual apparatus in transmitting stimuli to the brain can be obtained. SEE: *brainstem auditory evoked potential; evoked response; somatosensory evoked response*.

visual field The area within which objects may be seen when the eye is fixed. SEE: illus.; *perimetry*.

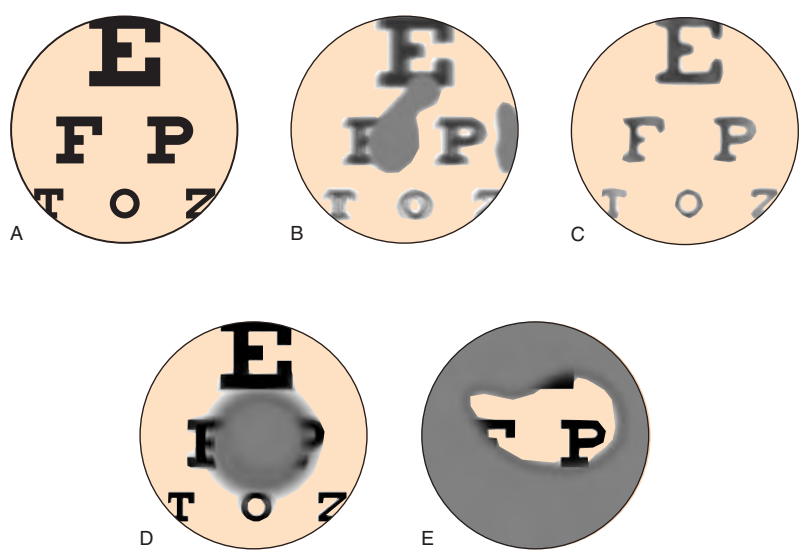
visual function Vision.

visual loss, functional A reduction in vision with no identifiable lesion of the visual pathways. It may be caused by an occult disease of the eye or of the optical centers in the brain. It may also occur in certain psychiatric disorders.

visualization (vĭzh″ū-ăl-ī-zā′shŭn) The act of viewing or sensing a picture of an object, esp. the picture of a body structure as obtained by radiographic study.

visualize (vĭzh′ū-ăl-īz) **1.** To make visible. **2.** To imagine or picture something in one's mind.

visual loss, functional A reduction in vision with no identifiable lesion of the visual pathways. It may be caused by an occult disease of the eye or of the optical centers in the brain. It may also occur in certain psychiatric disorders.



VISUAL FIELD ABNORMALITIES
(A) normal vision, (B) diabetic retinopathy, (C) cataracts, (D) macular degeneration, (E) advanced glaucoma

visual object agnosia Loss of the ability to visually recognize objects presented, even though some degree of ability to see is intact.

visual point The center of vision.

visuoauditory (vĭzh″ū-ō-aw′dĭ-tor″ē) [L. *visio,* a seeing, + *auditorius,* pert. to hearing] Rel. to sight and hearing, as connecting nerve fibers between auditory and visual centers.

visuognosis (vĭzh″ū-ŏg-nō′sĭs) [″ + Gr. *gnosis,* knowledge] The recognition and appreciation of what is seen.

visuopsychic (vĭzh″ū-ō-sī′kĭk) [″ + Gr. *psyche,* soul, mind] Both visual and psychic, applied to the cerebral area involved in perception of visual sensations.

visuosensory (vĭzh″ū-ō-sĕn′sō-rē) [L. *visio,* a seeing, + *sensorius,* sensory] Rel. to the recognition of visual impressions.

visuospatial (vĭzh″ū-ō-spā′shăl) Concerning the ability to discern spatial relationships from visual presentations.

vita glass (vī′tă-glăs) [L. *vita,* life, + AS. *glaes,* glass] Window glass containing quartz for transmitting the ultraviolet rays of sunlight.

vital (vī′tăl) [L. *vitalis,* pert. to life] **1.** Pert. to or characteristic of life. **2.** Contributing to or essential for life.

vitality (vī-tăl′ĭ-tē) **1.** Animation, action. **2.** The state of being alive.

vitalometer (vī″tă-lŏm′ĕ-tĕr) A diagnostic device that measures the response of a nerve in the pulp of a tooth to an electrical stimulus.

vital statistics Statistics relating to births (natality), deaths (mortality), marriages, health, and disease (morbidity). Vital statistics for the U.S. are published annually by the National Center for Health Statistics of the Department of Health and Human Services.

vitamer (vī′tă-mĕr) Any one of a number of compounds that have specific vitamin activity.

vitamin (vī′tă-mĭn) [L. *vita,* life, + *amine*] An accessory but vital nutrient that serves as a coenzyme or cofactor in an essential metabolic process. Small quantities of the substance assist biological reactions such as oxidation and reduction, or the synthesis of nucleic acids, hemoglobin, clotting factors, or collagen. Vitamin deficiencies produce well-recognized syndromes (e.g., scurvy [vitamin C deficiency], or beriberi [thiamine deficiency]). Unlike proteins, carbohydrates, fats, and organic salts, vitamins are not energy sources or components of body structures. Instead, they are agents that hasten or facilitate biochemical processes involving these other organic molecules. SEE: *dietary reference intakes; mineral*.

Only vitamins A, D, and K are made within the body. The rest must be consumed in the diet. Vitamin A is formed from its precursor, carotene; vitamin D is formed by the action of ultraviolet light on the skin; and vitamin K is formed by the symbiotic action of bacteria within the intestines.

A common classification system dis-

tinguishes fat-soluble vitamins (A, D, E, and K) from water-soluble vitamins (B and C). Fat-soluble vitamins are poorly assimilated in diseases that interfere with the digestion of fat, such as steatorrhea, but accumulate in organs like the liver when taken in excess. Water-soluble vitamins are readily lost from the body in urine and sweat and are more likely to be lacking from the body than overabundant. SEE: *Vitamins Appendix*.

One's need for vitamins increases in conditions that deplete their stores from the body, such as pregnancy and lactation, alcoholism, and febrile illnesses. Some drugs block the action of specific vitamins, or create illnesses that can be prevented with vitamin supplementation. In patients taking isoniazid for tuberculosis, for example, vitamin supplementation with pyridoxine is needed to prevent peripheral neuropathy.

SYMPTOMS: Refer to the *Vitamins Appendix* for signs and symptoms of vitamin deficiency.

vitamin A A fat-soluble vitamin formed within the body from alpha, beta, and gamma carotene, the yellow pigments of plants. It is essential for normal growth and development, normal function and integrity of epithelial tissues, formation of visual pigment, and normal tooth and bone development. It is stored in the liver. The recommended daily requirement for adults is 1000 mg. Retinol is the form of vitamin A found in mammals. One retinol equivalent is equal to 6 mg of beta-carotene. Excessive intake of vitamin A may cause acute or chronic effects and may increase risk of developing cancer in smokers. SYN: *retinol*. SEE: *hypervitaminosis; Vitamins Appendix*.

SOURCES: Butter, butterfat in milk, egg yolks, and cod liver oil are rich sources. The vitamin is found also in liver, green leafy and yellow vegetables, prunes, pineapples, oranges, limes, and cantaloupes.

STABILITY: This vitamin resists boiling for some time if not exposed to oxidation. It is quite stable with brief exposure to heat but not with continued high temperatures (above 100°C or 212°F).

DEFICIENCY DISORDERS: A deficiency of vitamin A causes interference with growth, reduced resistance to infections, and interference with nutrition of the cornea, conjunctiva, trachea, hair follicles, and renal pelvis. Thus these tissues have an increased susceptibility to infections. Vitamin A deficiency also interferes with the ability of the eyes to adapt to darkness (night blindness) and impairs visual acuity. Children with vitamin A deficiency will experience impaired growth and development. SEE: *Bitot's spots*.

vitamin A_1 A form of vitamin A found in fish liver oils.

vitamin A_2 A compound found in the livers of freshwater fish; similar in properties to vitamin A but with different ultraviolet absorption spectra.

vitamin B complex A group of water-soluble vitamins isolated from liver, yeast, and other sources. Only grain-made yeast preserves its potency if dried. Among vitamins included are thiamine (B_1), riboflavin (B_2), niacin (nicotinic acid), pyridoxine (B_6), biotin, folic acid, and cyanocobalamin (B_{12}).

SOURCES: *Thiamine:* Whole grains, wheat embryo, brewer's yeast, legumes, nuts, egg yolk, fruits, and vegetables. *Riboflavin:* Brewer's yeast, liver, meat, esp. pork and fish, poultry, eggs, milk, and green vegetables. *Nicotinic acid:* Brewer's yeast, liver, meat, poultry, and green vegetables. *Pyridoxine:* Rice, bran, and yeast. *Folic acid:* Leafy green vegetables, organ meats, lean beef and veal, and wheat cereals. *General:* Fortified cereals, breads and baked goods are good sources of these.

ACTION/USES: The B vitamins affect growth, stimulate appetite, lactation, and the gastrointestinal, neurological, and endocrine systems; aid in prevention of marasmus; stimulate appetite; are important in metabolism of carbohydrates, including sugar; and stimulate biliary action.

Vitamin B_1, thiamine, affects growth and nutrition and carbohydrate metabolism. B_2, riboflavin, affects growth and cellular metabolism. Nicotinic acid prevents pellagra. Pyridoxine is used by patients taking the antitubercular drug, isoniazid, to prevent peripheral neuropathy.

NOTE: Prolonged use of antibiotics may destroy intestinal flora that produce some of the B vitamins. Vitamin supplementation may be required to prevent deficiencies.

STABILITY: B vitamins are stable during normal cooking, although they may be destroyed by excessive heating for 2 to 4 hr. Baking soda destroys thiamine. Riboflavin and nicotinic acid are more stable than thiamine and are not destroyed by heat or oxidation.

DEFICIENCY DISORDERS: Deficiency causes beriberi, pellagra, digestive disturbances, enlargement of the liver, disturbance of the thyroid, degeneration of sex glands, and disturbance of the nervous system. It also induces edema; affects the heart, liver, spleen, and kidneys; enlarges the adrenals; and causes dysfunction of the pituitary and salivary glands.

vitamin B_1 Thiamine, or thiamine hydrochloride. The recommended daily allow-

ance is approx. 1.5 mg for men and 1.1 mg for women. SEE: *Vitamins Appendix.*

vitamin B_2 Riboflavin. SEE: *Vitamins Appendix.*

vitamin B_6 Pyridoxine; found in rice, bran, and yeast. Excess doses (2 to 5 g/day for months) have caused impairment of central nervous system function. SEE: *Vitamins Appendix.*

vitamin B_{12} A red crystalline substance, a cobamide, extracted from the liver, that is essential for the formation of red blood cells. Its deficiency results in pernicious anemia. It is used for prophylaxis and treatment of these and other diseases in which there is defective red cell formation. The recommended adult daily requirement is 2 μg/day. The terms vitamin B_{12} and cyanocobalamin are used interchangeably as the generic term for all of the cobamides active in humans. SYN: *cyanocobalamin*. SEE: *Vitamins Appendix.*

vitamin C Ascorbic acid, a factor necessary for formation of collagen in connective tissues and essential in maintenance of integrity of intercellular cement in many tissues, esp. capillary walls. Vitamin C deficiency leads to scurvy. SEE: *Vitamins Appendix.*

NOTE: The recommended adult daily allowance is 60 mg. Large daily doses of vitamin C have been recommended for prevention and treatment of the common cold. Although the effectiveness of vitamin C for this purpose has not been established, it is felt that the vitamin may at least decrease the severity of cold symptoms. Excess doses of vitamin C for an extended period can interfere with absorption of vitamin B_{12}, cause uricosuria, and promote formation of oxalate kidney stones.

SOURCES: Vitamin C is found in raw cabbage, young carrots, orange juice, lettuce, celery, onions, tomatoes, radishes, and green peppers. Citrus fruits and rutabagas are esp. rich in this vitamin. Strawberries are about as rich a source as tomatoes. Apples, pears, apricots, plums, peaches, and pineapples also contain vitamin C.

STABILITY: The vitamin is destroyed easily by heat in the presence of oxygen, as in open-kettle boiling. It is less affected by heat in an acid medium; otherwise, it is stable.

DEFICIENCY DISORDERS: Vitamin C deficiency causes scurvy, imperfect prenatal skeletal formation, defective teeth, pyorrhea, anorexia, and anemia. It also leads to undernutrition injury to bone, cells, and blood vessels.

vitamin D One of several vitamins having antirachitic activity. The vitamin D group, which is fat-soluble, includes D_2 (calciferol), D_3 (irradiated 7-dehydrocholesterol), D_4 (irradiated 22-dihydroergosterol), and D_5 (irradiated dehydrositosterol). It is essential in calcium and phosphorus metabolism; consequently, it is required for normal development of bones and teeth. The recommended daily allowance is 10 μg. The stability of this vitamin is not affected by oxidation; heat, unless over 100°C (212°F); or long-continued cooking. A deficiency of vitamin D causes imperfect skeletal formation, bone diseases, rickets, and caries. SEE: *Vitamins Appendix.*

SOURCES: Milk, cod liver oil, salmon and cod livers, egg yolk, and butter fat contain vitamin D. Ergosterol in the skin activated by sunlight or ultraviolet radiation possesses vitamin D potency.

ACTION/USES: Vitamin D is necessary for the absorption of calcium and phosphorus from food in the small intestine. It is called the antirachitic vitamin because its deficiency interferes with calcium and phosphorus use, which in turn causes rickets. Sun or ultraviolet radiation exposure synthesizes this vitamin in the body. Its presence is necessary for the most efficient absorption of calcium and phosphorus. It is used to treat and prevent infantile rickets, spasmophilia (infantile tetany), and softening of bone. Vitamin D is also important in normal growth and mineralization of skeleton and teeth.

Prolonged excessive doses of vitamin D (100,000 IU daily) cause hypercalcemia with anorexia, nausea, vomiting, polyuria, polydipsia, weakness, anxiety, pruritus, and altered renal function.

vitamin E A vitamin that consists of eight components: four tocopherols (of which alpha tocopherol is the most common constituent) and four tocotrienols. Vitamin E is an antioxidant found in many commonly consumed foods. Deficiencies of the vitamin in the general population are rare. Excessive doses (100 mg/kg/day) in low-birth-weight neonates have been implicated in the development of necrotizing enterocolitis and sepsis. The recommended adult daily allowance is 10 mg for men and 8 mg for women. SEE: *Vitamins Appendix.*

vitamin K An antihemorrhagic factor whose activity is associated with compounds derived from naphthoquinone. Vitamin K, which is fat soluble, is present in alfalfa, fats, oats, wheats, and rye; vitamin K_2, in fishmeal. Vitamin K_3 is synthesized as menadione sodium bisulfite. Vitamin K is necessary for synthesis of clotting factors VII, IX, X, and prothrombin by the liver. Its deficiency prolongs blood-clotting time and causes bleeding. Its roles in bone metabolism include its requirement for the conversion of osteocalcin to its active form and its requirement for matrix Gla-protein (MGP) function in bones,

teeth, and cartilage. Within the kidney, it acts to inhibit calcium oxalate stone formation. It appears to have a role in normal retinal signaling. In the newborn, the colon is sterile until food is ingested and bacteria colonize the site. Because this bacterial source of vitamin K is not immediately available, an intramuscular injection of 1 mg of water-soluble vitamin K_1 (phytonadione) is recommended for all newborns.

Large doses may cause hemolysis in persons with G6PD deficiency and in some healthy individuals. Large doses in the newborn may lead to anemia and kernicterus. The recommended adult daily allowance is 65 μg for women and 80 μg for men. SEE: *Vitamins Appendix.*

ACTION/USES: Vitamin K helps to eliminate prolonged bleeding in operations and in the biliary tract of jaundiced patients. Bile salts are necessary for its absorption.

vitamin loss Loss of vitamin content in food products as a result of oxidation or heating. Methods of preserving foods such as pickling, salting, curing, or fermenting and canning enhance vitamin loss. Vitamin C is especially labile; up to 85% is lost in commercial canning and pasteurization. Vitamin B_1 in wheat is lost through milling because the vitamin B_1 wheat embryo is removed.

vitamin supplement Any vitamin tablet or capsule containing one or more vitamins. Thus, a tablet or capsule may contain a single vitamin or many, and in some instances, a preparation will contain more than a dozen vitamins and an even greater number of minerals. In general, healthy adult men and healthy nonpregnant, nonlactating women consuming a normal, varied diet do not need vitamin supplements.

The difficulties of individuals choosing to treat themselves with vitamin supplements are: 1. People who take the supplements are usually already consuming an adequate diet. 2. The vitamins chosen are often not the ones inadequate in their diet. 3. The dose may be many times greater than the daily needs. SEE: *Food Guide Pyramid; vitamin C.*

vitellary (vĭt′ĕl-ā-rē) [L. *vitellus,* yolk of an egg] Vitelline.

vitellin (vī-tĕl′ĭn) A protein that can be extracted from egg yolk and contains lecithin. SEE: *nucleoprotein; ovovitellin.*

vitelline (vī-tĕl′ēn) Pert. to the yolk of an egg or the ovum.

vitelline duct Yolk stalk.

vitelline vein One of two veins conveying blood from the yolk sac.

vitellogenesis (vī″tĕl-ō-jĕn′ĕ-sĭs) The production of yolk.

vitellointestinal (vī″tĕl-ō-ĭn-tĕs′tĭn-ăl) Concerning the embryonic yolk sac and the intestinal tract.

vitellolutein (vī″tĕl-ō-lū′tē-ĭn) [L. *vitellus,* yolk, + *luteus,* yellow] A yellow pigment present in lutein.

vitellorubin (vī″tĕl-ō-rū′bĭn) [″ + *ruber,* red] A red pigment present in lutein.

vitellose (vī-tĕl′ōs) A proteose present in vitellin.

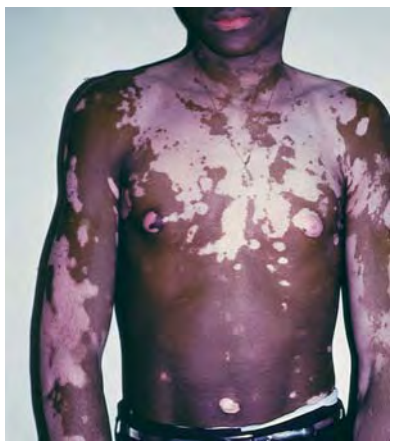
vitellus (vī-tĕl′ŭs) [L.] The yolk of an ovum, esp. the yolk of a hen's egg.

vitiation (vĭsh″ē-ā′shŭn) [L. *vitiare,* to corrupt] Injury, contamination, impairment of use or efficiency.

vitiligines (vĭt″ĭ-lĭj′ĭ-nēz) Depigmented areas of skin. SEE: *vitiligo.*

vitiliginous (vĭt″ĭ-lĭj′ĭ-nŭs) Concerning vitiligo.

vitiligo (vĭt-ĭl-ī′gō) [L.] A skin disorder characterized by the localized loss of melanocytes, with patchy loss of skin pigment. The depigmented areas, which appear most commonly on the hands, face, and genital region, are flat and pale and surrounded by normal pigmentation. Vitiligo affects all ages and races but is most noticeable in people with dark skin. The cause is unknown, but may be an autoimmune process since autoantibodies to melanocytes have been identified and vitiligo often occurs with autoimmune diseases. SYN: *leukoderma; skin, piebald.* SEE: illus.



VITILIGO

TREATMENT: Oral and topical synthetic trioxsalen and a natural psoralen, methoxsalen, are used with exposure to long-wave ultraviolet light, but the efficacy is doubtful. The lesions may be masked by use of cosmetic preparations. Vitiliginous areas should be protected from sunburn by applying a 5% aminobenzoic acid solution or gel to the affected areas. The use of 5% fluorouracil cream applied under an occlusive dressing to the depigmented areas may

cause erosion of the dermis and, after re-epithelialization, pigment may reappear.

v. capitis Vitiligo of the scalp with depigmentation of the hairs of the affected area.

perinevic v. Vitiligo surrounding a nevus.

vitium (vĭsh′ē-ŭm) *pl.* **vitia** [L., fault] A fault, defect, or vice.

vitrectomy (vī-trĕk′tō-mē) [L. *vitreus,* glassy, + Gr. *ektome,* excision] The surgical removal of the vitreous of the eye. The removed vitreous is replaced, usually with gas or liquid. This process is used to treat epiretinal membranes, macular pucker, macular hole, and other disorders of the retina or the vitreous.

enzymatic v. Pharmacological vitrectomy.

pharmacological v. A method of vitrectomy in which enzymes are used to liquefy the vitreous and weaken its attachment to the limiting membrane of the retina. SYN: *enzymatic vitrectomy*.

vitreocapsulitis (vĭt″rē-ō-kăp″sū-lī′tĭs) [L. *vitreus,* glassy, + *capsula,* capsule, + Gr. *itis,* inflammation] Inflammation of the vitreous humor. SYN: *hyalitis*.

vitreodentin (vĭt″rē-ō-dĕn′tĭn) A particularly hard and brittle form of dentin.

vitreoretinal (vĭt″rē-ō-rĕt′ĭ-năl) Concerning the vitreous and the retina.

vitreous (vĭt′rē-ŭs) [L. *vitreus,* glassy] **1.** Glassy. **2.** Pert. to the vitreous body of the eye. **3.** Vitreous body.

vitreous body A jellylike substance within the eye that fills the space between the lens and the retina. It is colorless and transparent. It may contain minute particles called "floaters."

vitrescence (vī-trĕs′ĕns) Becoming hard and transparent like glass.

vitreum (vĭt′rē-ŭm) Vitreous body.

vitrification (vī″trĭf-ĭ-kā′shŭn) The process of converting a silicate material into a smooth, viscous substance by heat. The silicate material hardens on cooling and possesses a smooth, glossy surface. In dentistry, it is related to the extensive use of ceramics, cements, and porcelains. These vary by the additive components that determine their density and refractive qualities.

vitriol (vĭt′rē-ōl) [L. *vitriolum*] A sulfate of any of various metals.

vitronectin (vī″trō-nĕk′tĭn) An adhesive glycoprotein found in the blood and the extracellular matrix. It contributes to blood clotting, cell growth and differentiation, the ability of tumors to metastasize, and normal wound healing. SYN: *complement S protein*.

vitropression (vĭt″rō-prĕsh′ŭn) [L. *vitrum,* glass, + *pressio,* a squeezing] A method of temporarily eliminating redness of the skin caused by hyperemia by pressure with a glass slide on the skin for the purpose of studying any lesions or discolorations.

vivi- (vĭv′ĭ) [L. *vivus*] Combining form meaning *alive.*

vividiffusion (vĭv″ĭ-dĭf-ū′zhŭn) [L. *vivus,* alive, + *dis,* apart, + *fundere,* to pour] The process of removing diffusible substances from the blood of a living animal by allowing it to flow through dialyzing membranes immersed in saline solution.

vivification (vĭv″ĭ-fĭ-kā′shŭn) [″ + *facere,* to make] **1.** Trimming of the surface layer of a wound to aid the union of tissues. **2.** Transformation of protein through assimilation into the living matter of cellular organisms.

viviparity (vĭv″ĭ-păr′ĭ-tē) The ability to produce living young rather than producing young by laying an egg that hatches.

viviparous (vĭv-ĭp′ăr-ŭs) [″ + *parere,* to bring forth, to bear] Developing young within the body, the young being expelled and born alive; the opposite of oviparous.

vivisect (vĭv′ĭ-sĕkt) [L. *vivus,* alive, + *sectio,* a cutting] To dissect a living animal for experimental purposes.

vivisection (vĭv″ĭ-sĕk′shŭn) [″ + *sectio,* a cutting] Cutting of or operation on a living animal for physiological investigation and the study of disease.

vivisectionist (vĭv″ĭ-sĕk′shŭn-ĭst) One who practices or believes in vivisection. SEE: *antivivisection*.

vivisector (vĭv-ĭs-ĕk′tor) [″ + *sector,* a cutting] One who practices vivisection.

VLDL *very low–density lipoprotein.*

VMA *vanillylmandelic acid.*

V_{max} *maximum velocity.*

V.N.A. *Visiting Nurse Association.*

VO_2 Ventilatory oxygen extraction, a measure of the exercise capacity of a patient.

vocal (vō′kăl) [L. *vocalis,* talking] Pert. to the voice.

vocal apparatus The organs that produce sounds and speech.

vocal cord Either of two thin, reedlike folds of tissue within the larynx that vibrate as air passes between them, producing sounds that are the basis of speech. SEE: illus.

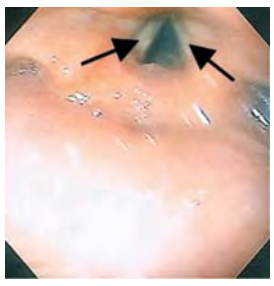
vocal cords, false The ventricular folds of the larynx.

vocal cords, true Vocal folds.

vocal folds The true vocal cords; the inferior pair of folds within the larynx; each contains a vocal ligament. They form the edges of the rima glottidis and are involved in the production of sound. SYN: *vocal cords, true*.

vocal ligament SEE: under *ligament*.

vocal lips Two shelflike projections of the lateral walls of the larynx. Their edges bear the vocal folds.



VOCAL CORDS

vocal signs The indication of disease by changes in the voice.
voces (vō′sēz) [L.] Pl. of vox.
voice (voys) [L. *vox*] A sound, uttered by human beings, produced by vibration of the vocal cords.
amphoric v. Cavernous v.
v. break The sudden interruption of speech, or a sudden decrease in vocal amplitude. It is a sign of laryngeal spasm.
cavernous v. A hollow voice sound heard during auscultation of the chest, indicating a pulmonary cavity. SEE: *amphoric v.*
eunuchoid v. The characteristic high-pitched voice of a male in whom the normal sexual development has not occurred or in a male who was castrated before puberty.
voiceprint (voys′prĭnt) A graphical representation of the characteristics of an individual's speech pattern. Because voiceprints, like fingerprints, can be used to distinguish one person from another, the technique is useful in forensic medicine and in identifying the voices of criminal suspects.
voices (voys′ĕz) In psychiatry, verbal-auditory hallucinations expressed as being heard by the patient.
void (voyd) [O.Fr. *voider,* to empty] **1.** To evacuate the bowels or bladder. **2.** An empty space, e.g., one seen in radiographical evaluation of arteries or veins.
vol *volume.*
vol% *volume percent.*
vola, volar (vō′lă, vō′lăr) [L.] Terms originally used to refer to the palm of the hand or sole of the foot. The preferred terms for reference to the palm of the hand are palmar and palmaris.
volaris (vō-lā′rĭs) Vola.
volatile (vŏl′ă-tĭl) [L. *volatilis,* flying] Easily vaporized or evaporated. Examples of volatile liquids are ether (boiling point, 34.5°C) and ethyl chloride (boiling point, 12.2°C).
volatilization (vŏl″ă-tĭl-ī-zā′shŭn) Conversion of a solid or liquid into a vapor.
volatilize (vŏl′ă-tĭl-īz) To vaporize a liquid or solid.
volition (vō-lĭsh′ŭn) [L. *volitio,* will] The act or power of willing or choosing.
volitional (vō-lĭsh′ŭn-ăl) Performed by volition.
Volkmann's canals (fōlk′mănz) [Alfred Wilhelm Volkmann, Ger. physiologist, 1800–1877] Small canals found in bone through which blood vessels pass from the periosteum. They connect with the blood vessels of haversian canals or the marrow cavity.
Volkmann's contracture (fōlk′mănz) [Richard von Volkmann, Ger. surgeon, 1830–1889] Degeneration, contracture, fibrosis, and atrophy of a muscle resulting from injury to its blood supply; usually seen in the hand. SYN: *ischemic paralysis*.
volley (vŏl′ē) [L. *volare,* to fly] The simultaneous or nearly simultaneous discharge of a number of nerve impulses from a center within the brain or spinal cord.
volt (vōlt) [Count Alessandro Volta, It. physicist, 1745–1827] An electrical unit of pressure, the electromotive force required to produce 1 ampere of current through a resistance of 1 ohm.
voltage (vōl′tĭj) Electromotive force or difference in potential expressed in volts.
voltaic (vŏl-tā′ĭk) Concerning electricity produced by a battery.
voltaism (vŏl′tă-ĭzm) Galvanism.
voltammeter (vōlt-ăm′mē-tĕr) A device for measuring both volts and amperes.
voltammetry, anodic stripping ABBR: ASV. An analytical technique used to assay blood lead content.
voltampere (vōlt-ăm′pēr) The value obtained by multiplying volts times amperes.
voltmeter (vōlt′mē″tĕr) A device for measuring voltage, esp. for determining the voltage between two points of an electrical circuit.
volubility (vŏl″ū-bĭl′ĭ-tē) [L. *volubilitas,* flow of discourse] Excessive speech.
volume (vŏl′ūm) The space occupied by a substance, usually a gas or liquid. Liquid volume is expressed in liters or milliliters; gas volume in cubic centimeters.
closing v. The amount of gas remaining in the lung when the small airways close during a maximum expiratory effort. It is increased in patients with small airway disease.
compressed v. The portion of the mechanically delivered tidal volume that is not delivered to the patient owing to expansion of the ventilator circuit with pressure. Tubing with a high compliance increases the compressed volume, esp. when the tidal volume is delivered under high pressure.
expiratory reserve v. The maximal amount of air that can be forced from the lungs after normal expiration.
hospital v. The number of cases of

specific conditions (e.g., stroke, acute myocardial infarction, or organ transplantation) treated at an inpatient facility. Morbidity and mortality are typically lowest in treatment centers where professional staff has the greatest clinical experience.

inspiratory reserve v. The maximal amount of air that can be inhaled after a normal inspiration.

mean corpuscular v. ABBR: MCV. The mean volume of an average erythrocyte. Normal values range from 82 to 92 cubic microns.

minute v. The volume of gas expired or inspired per minute in quiet breathing, usually measured as expired ventilation.

packed cell v. Hematocrit.

plasma v. The total quantity of plasma in the body. It decreases with dehydration and increases with greater salt and water intake and during early pregnancy. Plasma volume can be measured with injected fluorescent-labeled albumin.

residual v. ABBR: RV. The volume of air remaining in the lungs after maximal expiration. This air is essential for continuous gas exchange.

stroke v. The amount of blood ejected by the left ventricle at each heartbeat. The amount varies with age, sex, and exercise but averages 60 to 80 ml.

tidal v. The volume of air inspired and expired in a normal breath.

volume controller Buret (2).

volumenometer (vŏl″ūm-nŏm′ĕ-tĕr) Volumometer.

volume percent ABBR: vol%. The number of cubic centimeters (milliliters) of a substance (usually oxygen or carbon dioxide) contained in 100 ml of another substance (e.g., blood).

volumetric (vŏl″ū-mĕt′rĭk) [L. *volumen,* a volume, + Gr. *metron,* measure] Pert. to measurement of volume.

volumetric analysis Quantitative analysis performed by the measurement of the volume of solutions or liquids.

volumometer (vŏl″ū-mŏm′ĕ-tĕr) A device for measuring volume. SYN: *volumenometer*.

voluntary (vŏl′ŭn-tĕr″ē) [L. *voluntas,* will] Pert. to or under control of the will.

voluntary health agency Any nonprofit, nongovernmental agency, governed by lay or professional individuals and organized on a national, state, or local level, whose primary purpose is health related. This term applies to agencies supported mainly by voluntary public contributions. These agencies are usually engaged in programs of service, education, and research related to a particular disability or group of diseases and disabilities; for example, the American Heart Association, American Cancer Society, National Lung Institute, and their state and local affiliates. The term can also be applied to such agencies as nonprofit hospitals, visiting nurse associations, and other local service organizations that have both lay and professional governing boards and are supported by both voluntary contributions and charges and fees for service provided.

voluptuous (vō-lŭp′tū-ŭs) [L. *voluptas,* pleasure] **1.** Pert. to, arising from, or provoking, consciously or otherwise, sensual desire, usually applied to the female sex. **2.** Given to sensualism.

volute (vō-lūt′) [L. *volutus,* rolled] Convolute.

volutrauma (vŏl′ū-traw″mă) [L. *volumen,* scroll, something rolled, + Gr. *trauma,* wound] A lung injury caused by excessively high tidal volumes during the use of mechanical ventilation.

volvulus (vŏl′vū-lŭs) [L. *volvere,* to roll] A twisting of the bowel on itself, causing obstruction. A prolapsed mesentery is the predisposing cause. This usually occurs at the sigmoid and ileocecal areas of the intestines.

vomer (vō′mĕr) [L., plowshare] The plow-shaped bone that forms the lower and posterior portion of the nasal septum, articulating with the ethmoid, the sphenoid, the two palatine bones, and the two maxillae.

vomerine (vō′mĕr-ĭn) Pert. to the vomer.

vomerobasilar (vō″mĕr-ō-bās′ĭ-lăr) Concerning the vomer and base of the skull.

vomeronasal (vō″mĕr-ō-nā′săl) Pert. to the vomer and nasal bones.

vomeronasal organ Organ of Jacobson.

vomica (vŏm′ĭ-kă) *pl.* **vomicae** [L., ulcer] **1.** A cavity in the lungs, as from suppuration. **2.** Sudden and profuse expectoration of putrid purulent matter.

vomicose (vŏm′ĭ-kōs) Marked by many ulcers; ulcerous; purulent.

vomit (vŏm′ĭt) [L. *vomere,* to vomit] **1.** Material that is ejected from the stomach through the mouth. **2.** To eject stomach contents through the mouth. SYN: *vomitus*. SEE: *melena; nausea*.

PHYSIOLOGY: The act is usually a reflex involving the coordinated activity of both voluntary and involuntary muscles. A certain position is assumed, the glottis is closed, the diaphragm and abdominal muscles contract, and the cardiac sphincter of the stomach relaxes while antiperistaltic waves course over the duodenum, stomach, and esophagus.

bilious v. Bile forced back into the stomach and ejected with vomited matter.

black v. Vomit containing blood acted on by gastric digestion; seen in digestion conditions where blood collects in the stomach.

coffee-ground v. Vomit having the

appearance and consistency of coffee grounds because of blood mixed with gastric contents. It can occur in any condition associated with hemorrhage into the stomach.

vomiting (vŏm′ĭt-ĭng) [L. *vomere,* to vomit] Ejection through the mouth of the contents of the gastrointestinal tract. Along with diarrhea and hemorrhage, vomiting is an important potential cause of dehydration. It may result from toxins, drugs, uremia, and fevers; cerebral tumors; meningitis (often unaccompanied by nausea and failing to relieve associated headache); diseases of the stomach such as ulcer, cancer, dysmotility, or dyspepsia; reflex from pregnancy, uterine or ovarian disease, irritation of the fauces, intestinal parasites, biliary colic; intestinal obstruction; motion sickness; and neurological disorders such as migraine. Vomiting may also be psychological ("psychogenic") in origin. Esophageal vomiting may result from reflux or obstruction. SYN: *emesis*. SEE: table; *bulimia; hyperemesis gravidarum*.

TREATMENT: Antinausea medicines should be taken by mouth, rectally, intramuscularly or intravenously. Fluids may be given by mouth if the patient will accept them. If vomiting continues, intravenous fluids and electrolytes will be required to replace those lost in the vomit.

PATIENT CARE: Causative factors such as drugs, food, diseases, and psychological factors are assessed and treated if possible. Frequency, amount, time, and characteristics of vomit are assessed. The patient is positioned to protect the airway and prevent aspiration, and suction equipment is available. Antiemetics are administered as prescribed. Food and fluids are withheld for several hours, and mouth care is offered. If the patient requires surgery, restriction of foods and fluids for approx. 8 hr before surgery helps to prevent vomiting. Comfort measures, such as a cool cloth applied to the face, are instituted. Serum electrolytes are monitored, and accurate intake and output records are kept to ensure proper fluid replacement. Vital signs are monitored for evidence of dehydration. The health caregiver promotes a calm environment and provides distraction.

cyclic v. Periodic and recurring attacks of vomiting occurring in patients with a nervous temperament. Continued vomiting causes metabolic alkalosis as a result of chloride loss.

SYMPTOMS: Dizziness, loss of appetite, headache, and nausea may occur. The patient then vomits about every half hour for 1 to 2 days. Great thirst, slight rise of temperature, rapid pulse, and prostration are present.

PATIENT CARE: The patient's symptoms are assessed and documented, vital signs monitored, fluid and electrolyte balance maintained, and prescribed medications administered to relieve headache, nausea, and vomiting. A calm, stress-free environment is provided.

dry v. Nausea and retching without vomit.

epidemic v. Sudden unexplained attacks of gastroenteritis characterized by nausea, vomiting, and sometimes diarrhea. Although not proven, the symptoms are believed to be due to a virus. Treatment is symptomatic.

induced v. The production of vomiting by administering certain types of emetics (e.g., syrup of ipecac or amorphine) or by physical stimulation of the posterior pharynx.

CAUTION: Vomiting should never be induced after patients ingest caustic chemicals or in patients who cannot protect their own airways.

pernicious v. Hyperemesis gravidarum.

v. of pregnancy The vomiting, esp. morning sickness, that some women experience during pregnancy.

Causes of Vomiting

Gastrointestinal diseases	Esophageal obstruction, gastric distention, peptic ulcer disease, gastroparesis, cholecystitis, cholelithiasis, pancreatitis, intestinal obstruction, ileus
Metabolic illnesses	Hyponatremia, hypokalemia, hypercalcemia, adrenal insufficiency, uremia, ketoacidosis
Intoxications	Acetaminophen, arsenic, mercury, methanol, opiates, mescaline, food poisoning, and many others
Drug side effects	Antidepressants, digitalis, erythromycin, theophyllines, many chemotherapeutic drugs for the treatment of cancer (e.g., cisplatin)
Intracranial illnesses	Migraine, meningitis, intracranial hemorrhage
Febrile illnesses	Strep throat (esp. in children), pyelonephritis, and many others
Pregnancy	Hyperemesis gravidarum

projectile v. Ejection of vomit with great force.

psychogenic v. Occasional or persistent vomiting associated with severe emotional stress or brought on by the anticipation of stress. Each person has the potential for this reaction to emotional stress, but the threshold varies from one person to another.

stercoraceous v. Vomiting of fecal matter.

vomitus (vŏm′ĭ-tŭs) Vomit.

von Gierke disease (fŏn gēr′kĕz) [Edgar von Gierke, Ger. pathologist, 1877–1945] Glycogen storage disease type 1a. SYN: *glycogenosis; glycogen storage disease*.

von Graefe's sign (fŏn grā′fēz) [Albrecht von Graefe, Ger. ophthalmologist, 1828–1870] The failure of the eyelid to move downward promptly with the eyeball; the lid moves tardily and jerkily. This sign is seen in exophthalmic goiter.

von Hippel-Lindau syndrome Hippel's disease.

von Pirquet's test (fŏn pēr′kāz) [Clemens Peter Johann von Pirquet, Austrian pediatrician, 1874–1929] A diagnostic test for tuberculosis in which a small amount of tuberculin is applied to a scarified area of the skin of the arm. A positive reaction is seen if a pimply red eruption appears several days later at the site of inoculation. SEE: *tine test*.

von Recklinghausen's disease Type 1 neurofibromatosis.

von Recklinghausen's tumor Recklinghausen's tumor.

von Willebrand's disease (fŏn vĭl′ĕ-brăntz) [Erik Adolph von Willebrand, Finnish physician, 1870–1949] ABBR: vWD. A congenital bleeding disorder caused by either the mismanufacture of or a deficiency of a protein that helps platelets stick to injured blood vessels during the formation of blood clots. Inadequate amounts of the protein ("von Willebrand's factor") result in easy bruising or bleeding. Common symptoms of the disorder are frequent bleeding from the gums after toothbrushing, frequent or prolonged nosebleeds, heavy menstrual periods, or heavy bleeding after childbirth or surgery.

The disease is the most common inherited bleeding disorder. It is inherited in autosomal fashion – therefore, unlike hemophilia A and B it affects both boys and girls. The most common forms are autosomal dominant, but several recessive types of vWD are also known. Despite its high prevalence in the population (about 3% of Americans are affected), vWD is often undiagnosed because many people affected by vWD have mild episodes of bleeding. vWD can be diagnosed by the demonstration of low levels of von Willebrand's factor in the blood; by a prolonged bleeding time, or by factor VIII deficiency (one function of von Willebrand factor is to carry clotting factor VIII in plasma). Treatments for heavy bleeding episodes (or for necessary surgeries) may include the administration of clotting factors containing von Willebrand factor or Factor VIII, or synthetic vasopressin.

Voorhees' bag (voor′ēz) [James Ditmors Voorhees, U.S. obstetrician, 1869–1929] An inflatable rubber bag used in the distant past for dilating the cervix uteri to induce and facilitate labor.

voracious (vō-rā′shŭs) [L. *vorare,* to devour] Having an insatiable or ravenous appetite.

vortex (vor′tĕks) *pl.* **vortices** [L., a whirlpool] A structure having a spiral or whorled appearance.

coccygeal v. The region over the coccyx where lanugo hairs of the embryo come to a point.

v. of heart The region at the apex of the heart where muscle fibers of the ventricles make a tight spiral and turn inward.

v. lentis Spiral patterns on the surface of the lens owing to a concentric pattern of fiber growth.

vortices (vor′tĭ-sēz) [L.] Pl. of vortex.

v. pilorum Hair whorls as in arrangement of hairs on the scalp.

vorticose (vor′tĭk-ōs) [L. *vortices,* whirlpools] Whirling or having a whorled arrangement.

vorticose vein One of four veins (two superior and two inferior) that receive blood from all parts of the choroid of the eye. They empty into posterior ciliary and superior ophthalmic veins.

vox (vŏks) *pl.* **voces** [L.] Voice.

voxel A volume element, i.e., an individually representable volume of tissue detected by a digital radiographical imaging device, represented on the final image by a picture element (a "pixel").

voyeur (voy-yĕr′) [Fr., one who sees] One who derives sexual pleasure from observing nude persons or the sexual activity of others.

voyeurism (voy′yĕr-ĭzm) The experiencing of sexual gratification by observing nude persons or the sexual activity of others.

V/Q mismatch In ventilation/perfusion (V/Q) scanning, a region of the lung that ventilates normally but does not receive normal blood flow. SYN: *mismatch*.

V.R. *right vision; ventilation rate; vocal resonance.* SEE: *ventilation rate* under rate.

VRE *vancomycin-resistant enterococcus.*

VRSA (vē′ăr′ĕs′ā′) *vancomycin-resistant Staphylococcus aureus.*

V.S. *vesicular sound; vital signs; volumetric solution.*

VSD *ventricular septal defect.*

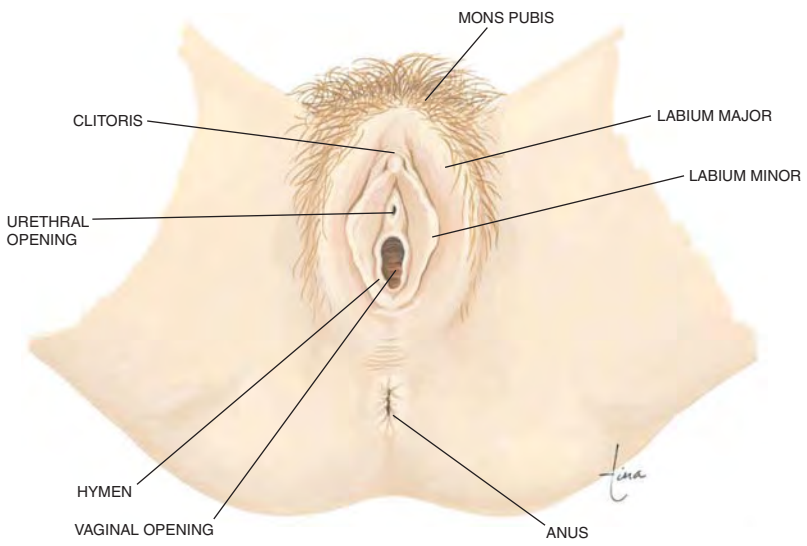
VT *tidal volume*.

vulgaris (vŭl-gā′rĭs) [L.] Ordinary, common.

vulnerable (vŭl′nĕr-ă-bl) [L. *vulnerare,* to wound] Easily injured or wounded.
vulnerant (vŭl′nĕr-ănt) **1.** Something that wounds or injures. **2.** To inflict injury.
vulnerary (vŭl′nĕr-ār″ē) **1.** Pert. to wounds. **2.** An agent, esp. a folk remedy or herb, used to promote wound healing.
vulsella, vulsellum (vŭl-sĕl′ă, vŭl-sĕl′ŭm) [L. *vulsella,* tweezers] A forceps with a hook on each blade.
vulva (vŭl′vă) *pl.* **vulvae** [L., covering] That portion of the female external genitalia lying posterior to the mons veneris, consisting of the labia majora, labia minora, clitoris, vestibule of the vagina, vaginal opening, Bartholin's glands. SYN: *pudendum femininum*. SEE: illus.
velamen v. An abnormally elongated clitoris.
vulval, vulvar [L. *vulva,* covering] Relating to the vulva.
vulvar dystrophy Lichen sclerosis et atrophicus.
vulvar leukoplakia Lichen sclerosis et atrophicus.
vulvar vestibulitis syndrome The presence of severe pain on pressing or touching the vestibule of the vagina or on attempted vaginal entry. Physical findings of localized erythema are limited to the mucosa of the vestibule. Although the etiology is unknown, the syndrome often develops in women who have intractable moniliasis or who are receiving long-term antibiotic therapy. No therapy, including vestibulectomy, has been 100% effective. SEE: *vulvodynia*.
vulvectomy (vŭl-vĕk′tō-mē) [″ + Gr. *ektome,* excision] Excision of the vulva, used to manage cancers of the vulva. Surgical approaches depend on the stage of neoplasia and range from simple vulvar excision to radical vulvectomy with node dissection. SEE: *vulvar cancer*.

PATIENT CARE: The caregiver provides emotional support, encourages questions, and meets the patient's informational needs. *Preoperative:* Care includes skin preparation, administration of prophylactic medications to prevent infection, and insertion of an indwelling catheter. The caregiver encourages the woman to verbalize her anxieties, fears, and concerns; validates her understanding of the procedure and its implications (change in body image and alterations in sexual function); and witnesses her informed consent. *Postoperative:* Care includes cleansing the wound with diluted hydrogen peroxide, rinsing with normal saline, and drying with a heat lamp, a cool-air hair dryer, or exposure to the air three or more times daily as ordered. The caregiver positions the woman for comfort and administers analgesics as needed and ordered. Discharge teaching emphasizes meticulous wound care. The patient is advised to report bleeding, purulent discharge, or intolerable pain to the primary caregiver. After a simple vulvectomy, sexual intercourse may resume when the wound has healed.

vulvitis (vŭl-vī′tĭs) [L. *vulva,* covering, + Gr. *itis,* inflammation] Inflammation of the vulva.
acute nongonorrheal v. Vulvitis re-



VULVA
Inferior view of the perineum

sulting from chafing of the opposed lips of the vulva or from accumulated sebaceous material around the clitoris.

desquamative v. Erosion or scarring of the vulva as a result of immunological or blistering conditions, such as contact dermatitis, lichen planus, lupus, or squamous cell carcinoma.

follicular v. Inflammation of the hair follicles of the vulva.

gangrenous v. Necrosis and sloughing of areas of the vulva, often a complication of infectious diseases such as diphtheria, scarlatina, herpes genitalis, or typhoid fever.

leukoplakic v. Lichen sclerosis et atrophicus.

mycotic v. Vulvitis caused by various fungi, most commonly *Candida albicans*.

plasma cellularis v., plasma cell vulvitis Inflammation and edema of the vulva, with infiltration of the upper dermis by plasma cells and other inflammatory cells. This rare condition causes itching, sexual discomfort, and discomfort during urination as well as a macular rash with sharply defined borders. SYN: *Zoon's vulvitis*.

vulvo- Combining form meaning *covering, vulva*.

vulvocrural (vŭl″vō-kroo′răl) [L. *vulva,* covering, + *cruralis,* pert. to the leg] Rel. to the vulva and thigh.

vulvodynia (vŭl″vō-dĭn′ē-ă) [″ + *dynia,* pain] Vulvar pain; a nonspecific syndrome of unknown etiology. Common complaints include sporadic pain, dyspareunia, and pruritus. A provisional diagnosis is based on the patient's symptoms, and an absence of any other vulvovaginal or systemic pathology. Palliative treatment is individualized, although some women report relief of symptoms with an oxalate-restricted diet. SEE: *vaginitis ; candidal vaginitis; pruritus, vulvar; vulvar vestibulitis syndrome*.

The Vulvar Pain Foundation provides information and support for women with vulvodynia. Their address is P.O. Box 4177, Graham, NC 27253. Phone 910-226-0704.

PATIENT CARE: The health care professional encourages the woman to verbalize her feelings and concerns. The eliciting and careful review of the woman's history focuses on identifying any coexisting disorders, and noting factors or events that preceded the symptoms and those that increase or decrease symptoms. Patient teaching for palliative self-care emphasizes soothing personal hygiene techniques and dietary modifications to reduce oxalate intake.

PERSONAL HYGIENE: Recommendations include the use of bland bath soap, warm water rinses over the vulva after voiding, and daily lukewarm sitz baths, while avoiding the use of known common irritants such as perfumed soaps, douches, and feminine hygiene sprays, as well as spermicidal agents (e.g., jellies and creams).

DIETARY MODIFICATIONS: Avoiding foods high in oxalic acid (e.g., beets, black tea, chocolate and cocoa, dried figs, ground pepper, nuts, parsley, rhubarb, spinach, Swiss chard) and taking the over-the-counter nutritional supplement calcium citrate may help reduce symptoms associated with urination.

idiopathic v. Vulvar dysesthesia.

vulvopathy (vŭl-vŏp′ă-thē) [″ + Gr. *pathos,* disease, suffering] Any disorder of the vulva.

vulvouterine (vŭl″vō-ū′tĕr-ĭn) [″ + *uterinus,* pert. to the uterus] Rel. to the vulva and uterus.

vulvovaginal (vŭl″vō-văj′ĭ-năl) [″ + *vagina,* a sheath] Pert. to the vulva and vagina. SYN: *vaginovulvar*.

vulvovaginal gland One of the small glands on either side of the vaginal orifice. SYN: *Bartholin's gland*.

vulvovaginitis (vŭl″vō-văj″ĭ-nī′tĭs) [″ + ″ + Gr. *itis,* inflammation] Simultaneous inflammation of the vulva and vagina, or of the vulvovaginal glands. The condition may be due to chemical irritation produced by materials present in medications, tight-fitting or nonabsorbent underclothes, inadequate perineal hygiene, allergic conditions, or a variety of infectious agents including bacteria, yeasts, viruses, and parasites.

diabetic v. Mycotic vulvar infection commonly occurring in diabetes mellitus.

VURD syndrome A combination of urinary tract abnormalities consisting of posterior urethral valves, unilateral urinary reflux, and dysplasia of the affected kidney. This condition typically occurs in male infants.

vv *veins*.

v/v *volume of dissolved substance per volume of solvent*.

V.W. *vessel wall*.

v/w *volume of a substance per unit of weight of another component*.

VX A toxic nerve gas, O-ethyl-[S]-[2-diisopropylaminoethyl]-methylphosphonothiolate, that might cause severe damage to public health if it were used in an act of biological terrorism.

V-Y-plasty A technique used in plastic surgery to repair a skin defect or to lengthen a scar as to release tension. A V-shaped incision is made, and the tissue at the apex of the V is placed on tension and advanced to create a straight limb of Y-shaped defect. The edges of the new wound are then sutured so that a Y-shaped scar is now produced.

W

W Symbol for the element tungsten (wolfram).

w *watt; week; wife; with.*

Waardenburg syndrome (văr′dĕn-bŭrg) [Petrus Johannes Waardenburg, Dutch ophthalmologist, 1886–1979] One of several related autosomally transmitted syndromes that may produce skin, neurological, ophthalmic, and auditory deficits.

Wachendorf's membrane (vŏk′ĕn-dorfs) [Eberhard J. Wachendorf, Dutch physician, 1703–1758] A thin membrane occluding the pupil of the embryo.

wafer (wā′fĕr) [Ger. *wafel*] A thin envelope or disk used to enclose a medication or to separate two structures from one another.

WAGR syndrome An acronym for a rare cluster of conditions and illnesses in childhood, including Wilms' tumor of the kidney, aniridia, gonadoblastoma, and mental retardation. Children affected by this sporadically occurring disease have mutations of chromosome 11 and at least two of the four listed conditions.

waist (wāst) [ME. *wast,* growth] The small part of the human trunk between the thorax and hips.

waiting list A form of health care rationing that is used esp. in the distribution of scarce resources, such as organs for transplantation.

wakeful (wāk′fŭl) [AS. *wacian,* to be awake, + *full,* complete] Not able to sleep; sleepless.

Walcher's position (vŏl′kĕrz) [Gustav Adolf Walcher, Ger. gynecologist, 1856–1935] A position in which the patient assumes a dorsal recumbent posture with the hips at the edge of the bed and the legs hanging down.

Wald, Lillian (wăld) U.S. nurse, 1867–1940, who founded the Henry Street Settlement in New York City, one of the world's first visiting nurse associations.

Wald cycle [George Wald, U.S.American biochemist, (Nobel Laureate), 1906-1997] The transformations involved in the breakdown or resynthesis of rhodopsin.

Waldenström's disease (văl′dĕn-strĕmz) [Johann Henning Waldenström, Swedish surgeon, b. 1877] Osteochondritis deformans juvenilis. SEE: *Waldenström's macroglobulinemia*.

Waldeyer's gland (vŏl′dī-ĕrz) [Wilhelm von Waldeyer, Ger. anatomist, 1836–1921] A sweat gland of the eyelids; usually found most prominently in the lower lid margin.

Waldeyer's ring Lymphoid ring.

wale A welt; a raised ridge on the skin or on the epithelial lining of an organ.

walk **1.** A method of locomotion of upright bipeds such as humans. **2.** The particular way an individual moves. SEE: *gait*.

walker A device used to assist a person in walking, esp. a person prone to falling. It consists of a stable platform made of lightweight tubing that is at a height that permits it to be grasped by the hands and used as support while taking a step. The walker is then moved forward and another step is taken. SEE: *crutch*.

walking [AS. *wealcan,* to roll] The act of moving on foot; advancing by steps.

impaired w. Limitation of independent movement within the environment on foot. SEE: *Nursing Diagnoses Appendix.*

walking system A complex device that enables patients with spinal injuries resulting in paralysis of the legs to walk. The device uses computer-controlled electrical stimulation to muscles so that walking may be accomplished. Each of these devices is made esp. for each patient, and their use is experimental.

walking wounded In military medicine, an ambulatory case.

wall [AS. *weall*] The limiting or surrounding substance or material of a vessel or cavity such as an artery, vein, chest, or bladder. In dentistry, it may refer to specific boundaries of a cavity preparation or its location within the tooth, for example, cavity walls: buccal, lingual, mesial, distal, pulpal, coronal, axial, cervical, facial, incisal, gingival, or enamel.

cell w. A wall made of cellulose and other materials that encloses a plant cell in a rigid framework. Plant cells have both cell membranes and cell walls. Plant cell walls cannot be digested by humans. SEE: *cellulose*.

Wallenberg's syndrome (vŏl′ĕn-bĕrgz) [Adolf Wallenberg, Ger. physician, 1862–1949] A complex of symptoms resulting from occlusion of the posteroinferior cerebellar artery or one of its branches supplying the lower portion of the brainstem. Dysphagia, muscular weakness or paralysis, impairment of pain and temperature senses, and cerebellar dysfunction are characteristic.

wallerian degeneration (wŏl-ē′rē-ăn) [Augustus Volney Waller, Brit. physician, 1816–1870] The dying back of the axons of nerves after an insult to nerve tissue, such as a toxic exposure, a meta-

bolic change, trauma, or deprivation of blood supply. The myelin surrounding the axon deteriorates, and the ability of the axon to transmit signals diminishes.

Waller's law of degeneration If a spinal nerve is completely divided, the distal portion undergoes fatty degeneration.

walleye (wăl′ī) [ME. *wawil-eghed*] **1.** An eye in which the iris is light-colored or white. **2.** Leukoma or dense opacity of the cornea. **3.** A squint in which both visual axes diverge. SYN: *strabismus, divergent*.

Walsh, Mary B. A U.S. nurse-educator and author who, with Helen Yura, published the first comprehensive text on nursing process in 1967. SEE: *nursing process; Nursing Theory Appendix.*

Walthard's islets, Walthard's inclusions (văl′tărdz) [Max Walthard, Swiss gynecologist, 1867–1933] Nests or small cysts of embryological squamous epithelium-like cells in the superficial parts of the ovary, tubes, and uterine ligaments.

wandering (wăn′dĕr-ĭng) [AS. *wandrian*] Moving about; not fixed.

wandering [specify sporadic or continual] Locomotion (with dementia or brain injury) characterized by its frequency and persistence: course appears to be meandering, aimless, or repetitive; frequently incongruent with boundaries, limits, or obstacles; impaired navigational ability. SEE: *Nursing Diagnosis Appendix.*

Wangensteen tube (wăn′gĕn-stēn) [Owen H. Wangensteen, U.S. surgeon, 1898–1981] A double-lumen tube used as a siphon to relieve abdominal distention, nausea, or vomiting in patients with intestinal ileus or obstruction. It was formerly used as an intranasal catheter in combination with a suction siphonage apparatus. SEE: *decompression*.

Wangiella (wăng″gē-ĕl′ă) [NL.] A genus of fungi that live in soil and rotting vegetation and have brown septate hyphae. The only known species in the genus is *W. dermatiditis*. The fungus primarily produces skin infections, although occasionally it can cause severe pneumonias or infections of the eye or brain, esp. in those with immunosuppressive diseases or conditions.

Warburg apparatus [Otto H. Warburg, Ger. biochemist, 1883–1970] A capillary manometer used for determining oxygen consumption and carbon dioxide production of small bits of cellular tissue. It is widely used in metabolism studies.

ward [AS. *weard,* watching over] A large room in a hospital for the care of several patients.

accident w. A ward reserved for the care of traumatic injuries.

psychiatric w. A ward in a general hospital for mentally ill patients.

warfarin poisoning SEE: under *poisoning*.

warfarin potassium An anticoagulant drug.

warfarin resistance syndrome A rare, autosomal dominant condition in which anomalies in the vitamin K receptor site interfere with or neutralize the effects of warfarin. Families with such anomalies have great difficulty achieving anticoagulation with warfarin.

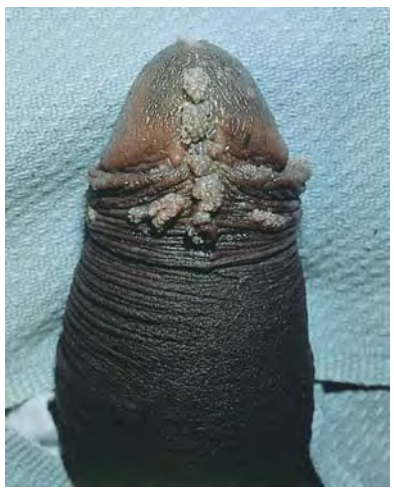
warfarin sodium [name derived from initials of *W*isconsin *A*lumni *R*esearch *F*oundation] An anticoagulant drug. Coumadin and Panwarfin are trade names.

wart (wort) [AS. *wearte*] A circumscribed cutaneous elevation resulting from hypertrophy of the papillae and epidermis. SEE: illus.

COMMON WARTS

common w. Verruca vulgaris.

genital w. A wart of the genitalia, caused by human papillomavirus (HPV). In women, these warts may be associated with cancer of the cervix. An estimated 1 million new cases of genital warts occur each year in the U.S. SYN: *venereal wart*. SEE: illus.



GENITAL WARTS ON PENIS

TREATMENT: A variety of therapies, including topically applied chemicals such as podophyllin, laser therapy, surgery, and recombinant interferon alfa-2a, have been used with varying degrees of success. Nevertheless, there is no completely safe and effective therapy available for genital warts.

PATIENT CARE: A history is obtained for unprotected sexual contact with a partner with known infection, a new partner, or multiple partners. Universal precautions are used to examine the patient, to collect a specimen, or to perform associated procedures. The health care professional inspects the genitalia for warts growing on the moist genital surfaces, such as the subpreputial sac, the urethral meatus, and less commonly, the penile shaft or scrotum in male patients and the vulva and vaginal and cervical wall in female patients. In both sexes, the papillomas may spread to the perineum and perianal area. These warts begin as tiny pink or red swellings and may grow as large as 4 in (10 cm) and become pedunculated. Multiple warts have a cauliflower-like appearance. The patient usually reports no other symptoms, but a few complain of itching and pain. Infected lesions become malodorous. The patient is monitored for signs of genital cancer and for infection. A nonthreatening, nonjudgmental atmosphere is provided to encourage the patient to verbalize feelings about perceived changes in sexual behavior and body image. Sexual abstinence or condom use during intercourse is recommended until healing is complete. The patient must inform sexual partners about the risk for genital warts and the need for evaluation. The patient should be tested for human immunodeficiency virus and for other sexually transmitted diseases. Genital warts can recur and the virus can mutate, causing warts of a different strain. The patient should report for weekly treatment until all warts are removed and then schedule a checkup for 3 months after all warts have disappeared. Female patients should have a Papanicolaou test every 6 months.

plantar w. A wart on a pressure-bearing area, esp. the sole of the foot. SYN: *verruca plantaris*. SEE: illus.

seborrheic w. Seborrheic keratosis.

venereal w. Genital wart.

PLANTAR WART

Warthin's tumor (wŏr′thĭns) [Aldred Warthin, U.S. pathologist, 1866–1931] A common benign tumor of the parotid gland. SYN: *papillary cystadenoma lymphomatosum*.

wash (wăsh) [AS. *wacsan*] **1.** The act of cleaning, esp. a part or all of the body. **2.** A medicinal preparation used in washing or coating.

eye w. A solution used to rinse the eyes. SYN: *collyrium*.

washout (wăsh′owt″) The lowering of the concentration of a substance from a solution, or from the human body, by withholding the substance and allowing it to be lost or excreted.

washout, nitrogen The removal of nitrogen from the body by breathing either 100% oxygen or a combination of oxygen and helium. Used to measure total lung capacity.

wasp [AS. *waesp*] Term sometimes applied to all insects belonging to the suborder Apocrita, order Hymenoptera (except the Formicidae or ants), but more generally restricted to the superfamilies Scolioidea, Vespoidea, and Specoidea. Members have the base of the abdomen constricted, and females have a piercing ovipositor, which in many species is modified into a sting. Many are social, living in large colonies. Common representatives are yellow jackets and hornets.

waste (wāst) [L. *vastus*, empty] **1.** Cachexia. **2.** Loss by breaking down of bodily tissue. **3.** Excreted material no longer useful to an organism.

hazardous w. In health care, any tissues; bioproducts such as blood, surgical sponges, needles, infectious materials, human remains; toxic substances; cytotoxic drugs; chemicals; or radioactive isotopes. These materials must be clearly labeled and securely stored before disposal, to prevent them from endangering public health.

solid w. Garbage, rubbish, trash, refuse, or sludge, as well as other discarded materials produced by agricultural, community, industrial, home, medical, mining, or municipal processes. Efforts to limit the environmental impact of solid waste, from the point of production through recovery processes to disposal and recycling, are known as solid waste management.

waste products Metabolic byproducts that would be harmful if allowed to accumulate, which are removed from the body by elimination. Carbon dioxide is exhaled from the lungs; undigested food and bile pigments are eliminated by the

colon. The kidneys form urine and excrete nitrogenous wastes (e.g., urea and creatinine) and excess amounts of minerals (e.g., sodium chloride).

wasting (wāst′ĭng) [L. *vastare,* to devastate] Enfeebling; causing loss of strength or size; emaciating. SEE: *marasmus*.

watchful waiting A strategy that includes frequent observation of a patient's condition rather than immediate intervention with drugs or surgery.

water (wă′tĕr) [AS. *waeter*] H_2O, hydrogen combined with oxygen, forming a tasteless, clear, odorless fluid.

Water freezes at 32°F (0°C) and boils at 212°F (100°C). It is the principal chemical constituent of the body, composing approx. 65% of the body weight of an adult male and 55% of the adult female. It is distributed within the intracellular fluid and outside of the cells in the extracellular fluid. Water is indispensable for metabolic activities within cells, as it is the medium in which chemical reactions usually take place. Outside of cells, it is the principal transporting agent of the body. The following properties of water are important to living organisms: it is almost a universal solvent; it is a medium in which acids, bases, and salts ionize, and the concentrations of these substances (electrolytes) must be and are normally regulated quite precisely by the body; it possesses a high specific heat and has a high latent heat of vaporization, important in regulation and maintenance of a constant body temperature; it possesses a high surface tension; and it is an important reacting agent and essential in all hydrolytic reactions.

Water is the principal constituent of all body fluids (blood, lymph, tissue fluid), secretions (saliva, gastric juice, bile, sweat), and excretory fluid (urine). Intake of water is determined principally by the sense of thirst. Excessive intake may lead to water intoxication; excessive loss to dehydration. Humans can survive for only a short time without water intake. The exact length of survival time varies with ambient temperature, moisture in available food, and amount of physical activity.

bound w. Intracellular water attached to organic molecules. It is not available for metabolic processes.

deionized w. Water that has been passed through a substance that removes cations and anions present as contaminants.

w. diffusion The movement of water into and out of cells (e.g., cells of the central nervous system after a stroke). Decreases in water diffusion are found when brain cells have been deprived of blood and oxygen.

distilled w. Water that has been purified by distillation. It is used in preparing pharmaceuticals.

emergency preparation of safe drinking w. The purification of water when only unclean water is available or when the available drinking water is believed to be contaminated. One of the following methods may be used: 1. Water is strained through a filter and boiled vigorously for 30 min. 2. Three drops of alcoholic solution of iodine are added to each quart (approx. 1 L) of water. The water is then mixed well and left to stand for 30 min before using. 3. Ten drops of 1% chlorine bleach, 2 drops of 4% to 6% chlorine bleach, or 1 drop of 7% to 10% chlorine bleach is added to each quart (liter) of water. The water is then mixed well and left to stand for 30 min. If the water is cloudy to begin with, double the amount of chlorine is used.

When the water is contaminated by *Giardia* organisms, heating to 55°C (131°F) kills the protozoa (method 1). Methods 2 and 3 also kill the cysts, but more time is required. Bacteria and viruses are killed by water kept at 60°C (140°F) for 30 min.

hard w. Water that contains dissolved salts of magnesium or calcium.

heavy w. D_2O; an isotopic variety of water, esp. deuterium oxide, in which hydrogen has been displaced by its isotope, deuterium. Its properties differ from ordinary water in that heavy water has a higher freezing and boiling point and is incapable of supporting life.

w. of hydration Water within the crystalline structure of an ionic compound that can be removed by heating or other means, leaving a pure salt.

w. for injection Water for parenteral use that has been distilled and sterilized.

lime w. SEE: under *lime*.

potable w. Water suitable for drinking. Drinking water should be free of disease-causing organisms and should contain only trace amounts of organic and/or inorganic chemicals.

purified w. Water that is mineral free; obtained by distillation, or deionization.

pyrogen-free w. Water that has been rendered free of fever-producing proteins (bacteria and their metabolic products). SEE: *w. for injection*.

soft w. Water that contains very little, if any, dissolved salts of magnesium or calcium.

waterborne (wă′tĕr-bŏrn″) Carried in water, esp. drinking water, surface water, lakes, rivers, or recreational swimming pools.

waterborne disease Any disease transmitted by consuming or bathing in water. Common disease-causing agents that contaminate water include *Cryptosporidium, Cyclospora,* some hepatitis

viruses, *Escherichia coli* 0157:H7, and metallic toxins.

water cure Hydrotherapy.

Waterhouse-Friderichsen syndrome (wăt′ĕr-hows-frĭd′ĕ-rĭk-sĕn) [Rupert Waterhouse, Brit. physician, 1873–1958; Carl Friderichsen, Danish physician, b. 1886] Acute adrenal failure due to hemorrhage into the adrenal gland caused by meningococcal infection. SEE: *adrenal gland; meningitis, acute meningococcal*.

Water's projection Maxillary sinus radiograph.

waters The common term for the amniotic fluid surrounding the fetus.

water syringe In dentistry, a syringe for delivering water spray to a localized area. The flow, pressure, and temperature are controlled.

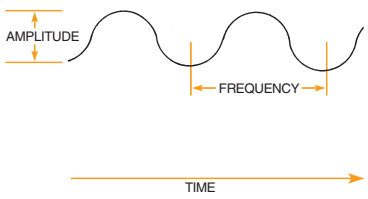
Watson, Margaret Jean Harman (wăt′sŏn) A nursing educator, born 1940, who developed the Theory of Human Caring. SEE: *Nursing Theory Appendix*.

Watson-Schwartz test (wŏt′sŏn-shwărts) [Cecil J. Watson, U.S. physician, 1901–1983; Samuel Schwartz, U.S. physician, b. 1916] A test used in acute porphyria to differentiate porphobilinogen from urobilinogen.

watt [James Watt, Scottish engineer, 1736–1819] ABBR: w. A unit of electrical power. One watt is the power produced by 1 ampere of current flowing with a force or pressure (i.e., electromotive force) of 1 volt. In SI units, 1 w equals 1 J/sec. In other units, 1 w equals 1 newton m/sec. This is also equal to 0.7376 ft-lb/sec. SEE: *electromotive force*.

wattage (wŏt′ĭj) The electrical energy produced or consumed by an electrical device, expressed in watts.

wave (wāv) [ME. *wave*] **1.** A disturbance, usually orderly and predictable, observed as a moving ridge with a definable frequency and amplitude. **2.** An undulating or vibrating motion. **3.** An oscillation seen in the recording of an electrocardiogram, electroencephalogram, or other graphic record of physiological activity. SEE: illus.



COMPONENTS OF WAVES

a w. **1.** A venous neck wave produced by atrial contraction. **2.** A component of right atrial and pulmonary artery wedge pressure tracings produced by atrial contraction. The a wave just precedes the first heart sound. It is absent in atrial fibrillation and is larger in atrioventricular dissociation and in conditions causing dilation of the right atrium.

afterpotential w. The wave produced after the action potential wave passes along a nerve. On the recording of the electrical activity, it will be either a negative or positive wave smaller than the main spike.

alpha w. An electroencephalographic deflection often generated by cells in the visual cortex of the brain. SEE: *alpha rhythm*.

beta w. An electroencephalographic deflection. Its frequency is between 18 and 30 Hz. SEE: *beta rhythm*.

blast w. A shock wave produced by a blast or explosion. The wave front consists of air under very high pressure that can cause great damage to people, objects, and structures.

brain w. The fluctuation, usually rhythmic, of electrical impulses produced by the brain. SEE: *electroencephalography*.

c w. A component of right atrial and pulmonary capillary wedge pressure waves. It reflects the closing of the tricuspid valve at the beginning of ventricular systole. An abnormal configuration is seen in increased right heart pressure and with abnormalities of the tricuspid valve.

delta w. An abnormal deflection seen on the electrocardiogram in patients with pre-excitation syndromes, such as Wolff-Parkinson-White syndrome. It occurs at the take-off of the QRS complex.

electromagnetic w. A wave-form produced by simultaneous oscillation of electric and magnetic fields perpendicular to each other. The direction of propagation of the wave is perpendicular to the oscillations. The following waves, in order of increasing frequency and decreasing wavelength, are electromagnetic: radio, television, microwave, infrared, visible light, ultraviolet, x-rays, and gamma rays. SEE: *electromagnetic spectrum* for table.

excitation w. The wave of irritability originating in the sinoatrial node that sweeps over the conducting tissue of the heart and induces contraction of the atria and ventricles.

F w. Flutter waves in atrial fibrillation, detectable on the electrocardiogram at 250 to 350 per minute.

f w. A fibrillatory wave seen as the wavy base line on the electrocardiogram tracing of atrial fibrillation. These waves are caused by multiple ectopic foci in the atria.

J w. An upwardly curving deflection of the J point of the electrocardiogram, found in patients whose body tempera-

ture is less than 32°C. This finding is one cardiac effect of hypothermia. The J wave has a particular shape; viewed from above, its surface is convex. SYN: *Osborne wave*.

light w. An electromagnetic wave that stimulates the retina or other optical sensors.

Osborne w. J wave.

P w. SEE: *electrocardiogram*.

pulse w. The pressure wave originated by the systolic discharge of blood into the aorta. It is not due to the passage of the ejected blood but is the result of the impact being transmitted through the arterial walls. The velocity in the aorta may be as high as 500 cm/sec and as low as 0.07 cm/sec in capillaries. The speed of transmission varies with the nature of the arterial wall, increasing with age as the arteries become less resilient. Thus in arteriosclerosis, the velocity is increased over normal.

Q w. A downward or negative wave of an electrocardiogram following the P wave. It is usually not prominent and may be absent without significance. New Q waves are present on the electrocardiogram after patients suffer myocardial infarction. SEE: *electrocardiogram*.

R w. SEE: *electrocardiogram*.

radio w. An electromagnetic wave between the frequencies of 10^{11} and 10^{4} Hz.

S w. SEE: *electrocardiogram*.

w. scheduling A method for assigning appointments for patients that brings several patients in to see their health care professionals at the same time (e.g., at the beginning of each hour instead of every 15 or 20 min during the hour).

shock w. **1.** A compression wave produced by a shock such as an earthquake or explosion that is characterized by a sudden change in air pressure, density, and velocity. **2.** An electromagnetic or sonic shock wave focused at a specific target (e.g., within the body). **3.** A sudden disruption. SEE: *extracorporeal shock wave lithotripsy; shock w.*

sound w. A vibration of a vibrating medium that, on stimulating sensory receptors of the cochlea, is capable of giving rise to a sensation of sound. In dry air, the velocity is 1087 ft (331.6 m)/sec at 0°C; in water, it is approx. four times faster than in air.

T w. The portion of the electrical activity of the heart that reflects repolarization of the ventricles. SEE: *electrocardiogram; interval, Q-T*.

theta w. A brain wave present in the electroencephalogram. It has a frequency of about 4 to 7 Hz.

ultrashort w. An arbitrary designation of radio waves of a wavelength of less than 1 m.

ultrasonic w. A sound wave of greater frequency than 20 kHz. These waves do not produce sound audible to the human ear.

wavelength (wāv′lĕngth) The distance between the beginning and end of a single wave cycle, usually measured from the top of one wave to the top of the next one.

wax [AS. *weax*] **1.** A substance obtained from bees (beeswax), plants, or petroleum (paraffin). It is solid at room temperature. In medicine, a purified form, white wax, is used in making ointments and to stop bleeding from bones during surgery. In dentistry, it is used, e.g., to create fixed appliances or dentures. **2.** Any substance with the consistency of beeswax. **3.** Earwax. SYN: *cerumen*.

bone w. A polymer used to fill defects in damaged body parts and to control bleeding from injured bone, e.g., in orthopedic surgery. Its use is occasionally associated with side effects, including the formation of foreign-body reactions or the development of infections.

casting w. A mixture of several waxes that can be carved or formed into shapes to be cast in metal.

waxing-up In dentistry, the shaping of wax around the contours of a trial denture or cast restoration.

wax pattern A molded or carved pattern in wax used extensively in dentistry and jewelry-making whereby casts are made using the lost wax technique.

waxy (wăks′ē) [AS. *weax,* wax] Resembling or pert. to wax.

WBC *white blood cell; white blood count.*

weak (wēk) [Old Norse *veikr,* flexible] **1.** Lacking physical strength or vigor; infirm, esp. as compared with what would be the normal or usual for that individual. **2.** Dilute, as in a weak solution, or weak tea. **3.** Biologically or chemically active; said, e.g., of acids, bases, electrolytes, muscles, or toxins.

weakness **1.** Fatigue; lack of strength; lack of energy. **2.** Any structural or functional deficiency.

positional w. The apparent weakness of a muscle when tested in a shortened range of motion. This is a normal phenomenon of a muscle's length-tension curve. To differentiate positional weakness from general muscle weakness, the muscle must be tested throughout its entire range of motion.

PATIENT CARE: The patient should be positioned carefully when testing for muscle force production. To assess strength accurately, muscles should be tested throughout the entire range of motion.

stretch w. The apparent weakness of a muscle resulting from prolonged positioning in a lengthened position, thus

shifting the muscle length-tension curve to the right; a form of positional weakness. This phenomenon is observed when the force production of the lengthened muscle is limited when it is tested in a relatively short position.

PATIENT CARE: Care must be taken in positioning when testing for muscle force production. To assess strength accurately, muscles should be tested in their functional or ideal positions or throughout the entire range of motion.

wean (wēn) [AS. *wenian*] **1.** To accustom an infant to discontinuation of breast milk by substitution of other nourishment. **2.** The gradual discontinuation of any form of therapy. SEE: *ventilator support, weaning from*.

weanling (wēn′lĭng) A young child or infant recently changed from breast to formula feeding.

weaponize (wĕ′pŏn-īz) To convert a bacterial culture or some other substance into an agent that can be used to injure or kill.

wear pattern The location of tooth erosion as determined by the characteristics of the facets of the teeth.

web A tissue or membrane extending across a space.

esophageal w. A group of thin membranous structures that include mucosal and submucosal coats across the esophagus. They may be congenital or may follow trauma, inflammation, or ulceration of the esophagus. SEE: *Plummer-Vinson syndrome*.

terminal w. A microscopic weblike network that is beneath the microvilli of intestinal absorption cells, and beneath the stereocilia of the hair cells of the inner ear.

webbed [AS. *webb,* a fabric] Having a membrane or tissue connecting adjacent structures, as the toes of a duck's feet.

Weber-Christian disease (wĕb′ĕr-krĭs′chĕn) [Fredrick Parkes Weber, Brit. physician, 1863–1962; Henry A. Christian, U.S. physician, 1876–1951] Relapsing, febrile, nodular, nonsuppurative panniculitis, a generalized disorder of fat metabolism characterized by recurring episodes of fever and the development of crops of subcutaneous fatty nodules.

Weber's gland (vā′bĕrz) [Moritz I. Weber, Ger. anatomist, 1795–1875] One of the mucous glands of the tongue.

Weber's law The increase in stimulus necessary to produce the smallest perceptible increase in sensation bears a constant ratio to the strength of the stimulus already acting.

Weber's syndrome (wĕb′ĕrz) [Sir Hermann David Weber, Brit. physician, 1823–1918] Paralysis of the oculomotor nerve on one side with contralateral spastic hemiplegia. It is caused by a lesion of the crus cerebri.

Weber's syndrome Paralysis of the hypoglossal nerve on one side and of the oculomotor nerve on the other, with paralysis of the limbs owing to a lesion of a cerebral peduncle.

Weber test [Friedrich Eugen Weber, Ger. otologist, 1823–1891] A test for unilateral deafness. A vibrating tuning fork held against the midline of the top of the head is perceived as being so located by those with equal hearing ability in the ears; to persons with unilateral conductive-type deafness, the sound will be perceived as being more pronounced on the diseased side; in persons with unilateral nerve-type deafness, the sound will be perceived as being louder in the good ear. SEE: *hearing*.

Wechsler Intelligence Scale for Children (wĕks′lĕr) [David Wechsler, Romanian-American psychologist, 1896–1981] ABBR: WISC. A widely used intelligence test for children aged 5 to 16.

wedge **1.** A solid object with a broad base and two sides arising from the base to intersect each other and to form an acute angle opposite the base. **2.** In radiography, a filter placed in the primary x-ray beam to vary the intensity.

step w. A device consisting of increasing thicknesses of absorber through which radiographs are taken to determine the amounts of radiation reaching the film.

WEE *western equine encephalomyelitis.*

WeeFIM The Functional Independence Measure adapted for children aged 6 months to 7 years. SEE: *Functional Independence Measure*.

weeping [AS. *wepan,* to lament] **1.** Shedding tears. **2.** Moist, dripping.

bloody w. Hemorrhage from the conjunctiva.

Wegener's granulomatosis, Wegener's syndrome (vĕg′ĕ-nĕrz) [Frederich Wegener, Ger. pathologist, 1843–1917] A systemic necrotizing vasculitis marked by pneumonitis and glomerulonephritis; small and medium-sized blood vessels throughout the body may be affected. The average age of onset is 40, and the disease affects men more often than women.

ETIOLOGY: The precise etiology is unknown. Autoantibodies have been identified in the blood of approx. 90% of patients. Granulomas may be present in the lung, upper respiratory tract, and small arteries and veins. Localized or diffuse inflammatory patches are seen in the glomerular capillaries of the kidney.

SYMPTOMS: Chronic pneumonitis and glomerulonephritis are the most prominent signs; ulcerations of the nasopharyngeal mucosa also are common. Other signs and symptoms include mus-

1983 Metropolitan Height and Weight Tables for Men and Women According to Frame, Ages 25 to 59

* Shoes with 1-in. heels.

† Indoor clothing weighing 5 lb for men and 3 lb for women.

cle and joint pain, skin rashes, fever, and neuropathy.

TREATMENT: Suppressive immunotherapeutic drugs such as cyclophosphamide and corticosteroids are used to control the disease. Trimethoprim-sulfamethoxazole may prevent relapses. There is a 1-year, 80% mortality rate in untreated patients; when treatment is effective, patients can live normal lifespans. Those with diffuse glomerular damage may develop chronic renal failure. SEE: *granuloma*.

Weigert's law (vī′gĕrts) [Carl Weigert, Ger. pathologist, 1845–1904] An observation stating that loss or destruction of tissue results in an excess of new tissue during repair.

weighing, underwater Hydrodensitometry.

weight (wāt) [AS. *gewiht*] The gravitational force exerted on an object, usually by the earth. The unit of weight is the newton; 1 newton equals 0.225 lb. The difference between weight and mass is that the weight of an object varies with the force of gravity, but the mass remains the same. For example, an object weighs less on the moon than on earth because the force of gravity is less on the moon; but the object's mass is the same in both places. SEE: *mass* (3).

Many diseases cause alterations of body weight (BW), for example, BW decreases in Addison's disease, AIDS, cancer, chronic diarrhea, chronic infections, untreated type I diabetes mellitus, anorexia, lactation when prolonged, marasmus, obstruction of the pylorus or thoracic duct, starvation, tuberculosis, and peptic ulcer.

Normal weight depends on the frame of the individual. SEE: table.

apothecaries' w. SEE: *apothecaries' weights and measures*.

atomic w. ABBR: at. wt. The weight of an atom of an element compared with that of ½₂ the weight of carbon-12.

avoirdupois w. SEE: *avoirdupois measure*.

birth w. The weight of the newborn. Normal weight of the newborn is between 5.5 lb (2.5 kg) and 10 lb (4.5 kg). Birth weight is an important index of maturation and chance for survival. Weight of less than 2.5 kg is associated with an increased chance of death in the perinatal period. Medical advances have increased the chance of survival of newborns of 2.0 kg or more. SEE: *large for gestational age; small for gestational age*.

w. cycling Rapid increases and decreases in body weight. SEE: *yo-yo diet*.

equivalent w. An obsolete term for the weight of a chemical element that is equivalent to and will replace a hydrogen atom (1.008 g) in a chemical reaction.

ideal body w. ABBR: IBW. The

number of pounds or kilograms a person should weigh, based on height and frame, to achieve and maintain optimal health. Several tables, such as the Metropolitan Life Height and Weight Table, show ideal body weights for men and women of varying heights. These references may be used to help set goals for patients who are underweight or overweight. SEE: *weight* for table.

w. loss A decline in body weight (BW). It is mild when 5% of BW is lost, moderate when 5% to 10% of BW is lost, and high when more than 10% of BW is lost.

PATIENT CARE: Intentional weight loss achieved through dieting and/or exercise has significant health benefits for the overweight or obese. It reduces the risk of many common illnesses, including coronary artery disease, type 2 diabetes mellitus, hyperlipidemia, and hypertension. Unintentional weight loss, esp. of more than 10% of body weight, may be a marker of serious disease, such as cancer, depression, hyperthyroidism, malabsorption, or peptic ulcers.

low birth w. ABBR: LBW. Abnormally low weight of a newborn, usually less than 2500 g. A 280-g infant has survived, but with physical and mental impairment.

Identifying mothers at risk for delivery of LBW infants involves careful assessment. Demographic factors include maternal age (adolescence) and nonwhite race; the highest risk occurs in primiparas under the age of 15. A review of the mother's history often finds low birth weight or prepregnancy weight, previous preterm delivery or spontaneous abortion, delivery of other LBW newborns, or fetal exposure to diethylstilbestrol. Cigarette smoking or abuse of other substances (i.e., alcohol or narcotics) may be involved. Other factors include height less than 60 in and weight less than 80% of standard weight for height, diabetes with vascular changes, *Chlamydia trachomatis* genital tract infections, and urinary tract infections.

molecular w. ABBR: mol. wt.; MW. The weight of a molecule attained by totaling the atomic weight of its constituent atoms. SEE: *atomic w.*

set point w. The concept that body weight is controlled by the central nervous system and set at a certain value; the value is more or less stable until something occurs to alter it. An example of resetting of the set point occurs in persons with a disturbance of hypothalamic function that interferes with the satiety and feeding centers.

usual body w. ABBR: UBW. Body weight value used to compare a person's current weight with his or her own baseline weight. The UBW may be a more realistic goal than the ideal body weight for some individuals. SEE: *ideal body w.*

w. in volume ABBR: w/v. The amount by weight of a solid substance dissolved in a measured quantity of liquid. Percent w/v expresses the number of grams of an ingredient in 100 mL of solution.

w. in weight ABBR: w/w. The amount by weight of a solid substance dissolved in a known amount (by weight) of liquid. Percent w/w expresses the number of grams of one ingredient in 100 g of solution.

weighting **1.** In radiation therapy using two opposing fields, the use of a higher dose for one of the fields. **2.** In statistical or numerical analysis, the placing of emphasis on a variable or the gauging of the impact of a variable among a group of potential influences on an outcome.

weightlessness The condition of not being acted on by the force of gravity. It is present when astronauts travel in areas so distant from the earth, moon, or planets that the force of gravity is virtually absent.

weights and measures SEE: *Weights and Measures Appendix*.

Weil's disease (vīlz) [Adolf Weil, Ger. physician, 1848–1916] Leptospirosis caused by any one of several serotypes of *Leptospira interrogans* such as *L. icterohemorrhagica* in rats, *L. pomona* in swine, or *L. canicola* in dogs. All of these may be pathogenic for humans.

ETIOLOGY: The infection is caused by contact with infected rat urine or feces.

SYMPTOMS: Symptoms include muscular pains, fever, jaundice, and enlargement of the liver and spleen.

TREATMENT: Penicillins or tetracyclines are curative.

PREVENTION: Doxycycline may be used to prevent infection in those exposed to the spirochetes.

Weil-Felix reaction, Weil-Felix test (vīl-fā′lĭks) [Edmund Weil, Austrian bacteriologist, 1880–1922; Arthur Felix, Ger. bacteriologist, 1887–1956] The agglutination of certain *Proteus* organisms caused by the development of *Proteus* antibodies in certain rickettsial diseases.

Weir Mitchell's treatment (wēr mĭt′chĕlz) [Silas Weir Mitchell, U.S. neurologist, 1829–1914] The treatment for hysteria and neurasthenia that consisted of bedrest, massage, nourishing diet, and a change of environment.

weismannism (wīs′măn-ĭzm) [August F. L. Weismann, Ger. biologist, 1834–1914] The theory that acquired characteristics are not inherited.

Weitbrecht's foramen (vīt′brĕkts) [Jo-

sias Weitbrecht, Ger.-born Russian anatomist, 1702–1747] The opening in the articular cartilage of the shoulder joint.

Weitbrecht's ligament A small ligament between the proximal ends of the radius and ulna.

Welch's bacillus (wĕlsh′ĕz) [William Henry Welch, U.S. pathologist, 1850–1934] *Clostridium perfringens,* the causative organism of gas gangrene. SEE: *gangrene, gas*.

weld (wĕld) [variant of *well,* to boil] To fuse or join two objects with heat.

Wellens' syndrome (wĕl′ĕns) [Hein J.J. Wellens, contemporary cardiologist from the Netherlands] The electrocardiographic (ECG) signs of impending occlusion of the left main or left anterior descending coronary artery. ECG shows an inverted symmetrical T wave with little or no associated change of the ST segment or R wave. Inversion appears principally in the V leads. The finding identifies patients who are at risk for an extensive myocardial infarction.

wellness Good health, as well as its appreciation and enjoyment. Wellness is more than a lack of disease symptoms; it is a state of mental and physical balance and fitness. SYN: *subjective well-being*.

Wells syndrome Eosinophilic cellulitis.

welt [ME. *welte*] An elevation on the skin produced by a lash, blow, or allergic stimulus. The skin is unbroken and the mark is reversible.

wen (wĕn) [AS.] A cyst resulting from the retention of secretion in a sebaceous gland. One or more rounded or oval elevations, varying in size from a few millimeters to about 10 cm, appear slowly on the scalp, face, or back. They are painless, rather soft, and contain a yellow-white caseous mass. The sac and contents should be carefully dissected to prevent its recurrence. SYN: *sebaceous cyst; steatoma*. SEE: *Fordyce's disease*.

Wenckebach's period, Wenckebach's phenomenon (vĕn′kĕ-băks) [Karel F. Wenckebach, Dutch-born Aust. internist, 1864–1940] A form of incomplete heart block in which, as detected by electrocardiography, there is progressive lengthening of the P-R interval until there is no ventricular response; and then the cycle of increasing P-R intervals begins again.

Werdnig-Hoffmann disease (vĕrd′nĭg-hŏf′măn) [Guido Werdnig, Austrian neurologist, 1844–1919; Johann Hoffmann, Ger. neurologist, 1857–1919] Spinal muscular atrophy.

Werdnig-Hoffmann paralysis Infantile muscular atrophy, considered by some to be identical with amyotonia congenita.

Werdnig-Hoffmann syndrome Werdnig-Hoffmann paralysis.

Werlhof's disease (vĕrl′hŏfs) [Paul G. Werlhof, Ger. physician, 1699–1767] Idiopathic thrombocytopenic purpura.

Wermer's syndrome [Paul Wermer, U.S. physician, d. 1975] Multiple endocrine neoplasia.

Werner's syndrome [C. W. O. Werner, Ger. physician, 1879-1936] A disease in which adults age at an accelerated pace. The disease is inherited in an autosomal recessive fashion. SEE: *progeria*.

Wernicke's aphasia (vĕr′nĭ-kē) [Karl Wernicke, Ger. neurologist, 1848–1905] An injury to the Wernicke's area in the temporal lobe of the dominant hemisphere of the brain, resulting in an inability to comprehend the spoken or written word. Visual and auditory pathways are unaffected; however, patients are unable to differentiate between words or interpret their meaning. Although patients speak fluently, they are unable to function socially because their ability to communicate effectively is impaired by a disordered speech pattern called paraphasia (i.e., inserting inappropriate syllables into words or substituting one word for another). They also may be unable to repeat spoken words. If the condition is due to a stroke, the aphasia may improve with time. The disorder is often caused by impairment of blood flow through the lower division of the left middle cerebral artery. SEE: *speech, paraphasic*.

Wernicke's center An area in the dominant hemisphere of the brain that recalls, recognizes, and interprets words and other sounds in the process of using language.

Wernicke's encephalopathy Encephalopathy associated with thiamine deficiency; usually associated with chronic alcoholism or other causes of severe malnutrition. SYN: *Wernicke's syndrome*.

Wernicke's syndrome Wernicke's encephalopathy.

Western blot test A technique for analyzing protein antigens. Initially, the antigens are separated by electrophoresis on a gel and transferred to a solid membrane by blotting. The membrane is incubated with antibodies, and then the bound antibodies are detected by enzymatic or radioactive methods. This method is used to detect small amounts of antibodies.

West Nile virus SEE: under *virus*.

Westphal-Edinger nucleus (vĕst′făl-éd′ĭng-ĕr) [Karl Westphal, Ger. neurologist, 1833–1890; Ludwig Edinger, Ger. neurologist, 1855–1918] A small group of nerve cells in the rostral portion of the nucleus of the oculomotor nerve. Efferent fibers pass to the ciliary ganglion conveying impulses destined for the intrinsic muscles of the eye.

Westphal-Strümpell pseudosclerosis (vĕst′făl-strĭm′p'l) [K. Westphal; Adolf G. G. von Strümpell, Ger. physician, 1853–1925] Wilson's disease.

wet (wĕt) [AS. *waet*] Soaked with moisture, usually water.

wet brain An increased amount of cerebrospinal fluid with edema of the meninges; may be associated with alcoholism.

wet cup A cupping glass used after scarification.

wet dream Nocturnal emission.

wet nurse A woman who breastfeeds another's child.

wet nurse phenomenon The production of milk in response to repeated stimulation of the nipples in unpregnant women who have previously been pregnant.

wet pack A form of bath given by wrapping a patient in hot or cold wet sheets, covered with a blanket, used in the distant past esp. to reduce fever.

Wetzel grid (wĕt′sĕl) [Norman C. Wetzel, U.S. pediatrician, b. 1897] A graph for use in evaluating growth and development in children aged 5 to 18 years.

Weyers acrofacial dysostosis An autosomal dominant syndrome characterized by short stature and dental anomalies, nail dystrophy, and polydactyly. Some geneticists consider it a variant of Ellis-van Creveld syndrome.

Wharton's duct (hwăr′tŏnz) [Thomas Wharton, Brit. anatomist, 1614–1673] The duct of the submandibular salivary gland opening into the mouth at the side of the frenulum linguae. SYN: *submandibular duct*.

Wharton's jelly The gelatinous intercellular material of the umbilical cord; it consists of collagen, mucin, and hyaluronic acid.

wheal (hwēl) [ME. *wale,* a stripe] An elongated mark or ridge. Such a ridge is produced by intradermal injection.

wheal (hwēl) [AS. *hwele*] A more or less round and temporary elevation of the skin, white in the center with a pale-red periphery, accompanied by itching. It is seen in urticaria, insect bites, anaphylaxis, and angioneurotic edema. SYN: *pomphus*.

wheal and flare reaction The response within 10 to 15 min to an antigen injected into the skin. The injected skin elevates and blanches, and becomes surrounded by a red rim of inflamed tissue.

wheat (hwēt) [AS. *hwaete*] Any of various cereal grasses, widely cultivated for its edible grain used in making flour. Wheat preparations and pastas include macaroni, vermicelli, and noodles, which are made from flour and water, molded, dried, and slightly baked. They are easy to digest.

STRUCTURE: Wheat is composed of the husk or outer coat, which is removed before grinding; bran coats, which are removed in making white flour and contain the mineral substances; gluten, which contains the fat and protein; and starch, the center of the kernel. Refined wheat products do not include the bran and germ, which contain B complex vitamins, phosphorus, and iron.

Individuals who are gluten intolerant (e.g., persons with celiac sprue) cannot digest the protein gluten found in wheat.

wheat germ The embryonic portion of of the wheat seed or kernel. It contains vitamin E, thiamine, riboflavin, and other micronutrients.

Wheatstone bridge An electric circuit with two branches, each containing two resistors. These branches are joined to complete the circuit. If the resistance in three resistors is known, the resistance of the fourth and unknown one can be calculated.

wheel A disk attached through its middle to an axle that rotates. In dentistry, small wheels are attached to a handpiece or lathe, and used for polishing and shaping teeth, restorations, and appliances.

carborundum w. A cutting wheel containing silicon carbide, in variable grit sizes.

diamond w. In dentistry, a wheel that contains diamond powder or chips.

polishing w. In dentistry, a wheel made of soft material suitable for polishing teeth or restorations.

wire w. A wheel containing pieces of wire. It is used for cleaning metal surfaces.

wheelchair A type of mobility device for personal transport. Traditional wheelchairs have a seating area positioned between two large wheels, with two smaller wheels at the front. These can be self-propelled through handrims or pushed by another person. Advances in wheelchair design have provided alternatives that accommodate obstacles and rough terrain. Lightweight, collapsible models exist, as well as models designed for racing and sports. Powered wheelchairs and scooters, driven by electric motors, can be controlled through electronic switches and enable mobility by persons with muscle weakness or even paralysis.

wheeze (hwēz) [ME. *whesen*] A continuous musical sound caused by narrowing of the lumen of a respiratory passageway. Often noted only by the use of a stethoscope, it occurs in asthma, croup, hay fever, mitral stenosis, and bronchitis. It may result from asthma, tumors, foreign body airway obstructions, bronchial spasm, pulmonary infections, emphysema and other chronic obstructive lung diseases, or pulmonary edema.

wheezing The production of whistling sounds during difficult breathing such as occurs in asthma, coryza, croup, and other respiratory disorders. SEE: *wheeze*.

whey The watery material separated from the curd of milk that has coagulated.

whiplash injury An imprecise term for injury to the cervical vertebrae and adjacent soft tissues. It is produced by a sudden jerking or relative backward or forward acceleration of the head with respect to the vertebral column. This type of injury may occur in a vehicle that is suddenly and forcibly struck from the rear.

Whipple's disease (hwĭp′ĕlz) [George Hoyt Whipple, U.S. pathologist, 1878–1976] An infectious disease with gastrointestinal and systemic features caused by the organism *Trophermya whippelii*. This rare disease resembles idiopathic steatorrhea. SYN: *intestinal lipodystrophy*.

TREATMENT: Intensive antibiotic therapy with procaine penicillin followed by maintenance therapy with tetracycline yields good results.

whipworm (wĭp′wŭrm) *Trichuris trichiura*.

whiskey, whisky (hwĭs′kē) A distilled alcoholic liquor made from grain. The alcohol present is ethyl alcohol.

whisper (hwĭs′pĕr) [AS. *hwisprian*] **1.** Speech with a low, soft voice; a low, sibilant sound. **2.** To utter in a low sound.

cavernous w. Direct transmission of a whisper through a cavity in auscultation.

whistle (hwĭs′ĕl) **1.** A sound produced by pursing one's lips and blowing. **2.** A tubular device driven by wind that produces a loud and usually shrill sound.

whistling face syndrome A congenital malformation with muscle dysfunction that produces a masklike "whistling face," hypoplastic nasal bones, and clubfeet. The genetic transmission may be autosomal recessive. SYN: *Freeman-Sheldon syndrome*.

white (hwīt) [AS. *hwit*] **1.** The achromatic color of maximum lightness that reflects all rays of the spectrum. **2.** The color of milk or fresh snow; opposite of black.

white cell Leukocyte.

white-clot syndrome Widespread blood clotting, usually in several veins and arteries at once, that is associated with thrombocytopenia. Caused by an adverse immune reaction to heparin, the condition is often life threatening. SEE: *heparin-induced thrombocytopenia*.

white-damp Carbon monoxide formed in a mine following an explosion.

white of egg The albumin of an egg.

white of eye The part of the sclera visible around the iris.

white gangrene Gangrene caused by local impairments of blood flow.

whitehead (hwīt′hĕd) A closed comedo containing pale, dried sebum. SEE: *blackhead; comedo*.

white leg Phlegmasia alba dolens.

whitepox (hwīt′pŏks) Variola minor.

whites Slang for leukorrhea.

white softening The stage of softening of any tissue in which the affected area has become white and anemic.

whitlow (hwĭt′lō) [ME. *whitflawe,* white flow] Suppurative inflammation at the end of a finger or toe. It may be deep seated, involving the bone and its periosteum, or superficial, affecting parts of the nail. SYN: *felon; panaris; paronychia; runaround*.

herpetic w. Whitlow due to herpes simplex virus. It is painful and accompanied by lymphadenopathy. Herpetic whitlow occurs commonly in health care workers as a result of exposure to viral shedding from patients with herpetic lesions on the skin.

WHO *World Health Organization.*

whole body counter An instrument that detects the radiation present in the entire body.

whole bowel irrigation SEE: under *irrigation*.

wholism (hōl′ĭzm) Holism.

wholistic health Holistic medicine.

whoop (hoop) [AS. *hwopan,* to threaten] The sonorous and convulsive inspiratory crow following a paroxysm of whooping cough.

whooping cough Pertussis.

WHO QoL-100 An international measure of quality of life developed by the World Health Organization based on assessments of physical and psychological well-being, level of independent living, social relationships, and environmental quality.

whorl (hwŭrl) [ME. *whorle*] **1.** A spiral arrangement of cardiac muscle fibers. SYN: *vortex*. **2.** A type of fingerprint in which the central papllary ridges turn through at least one complete circle. SEE: *fingerprint* for illus.

WIC *Special Supplementary Food Program for Women, Infants, and Children.*

Wickham's striae (wĭ′kămz strē′ă) [L. F. Wickham, Fr. dermatologist, 1861–1913] Lines that are demonstrable on the buccal mucosa in patients with lichen planus.

Widal's reaction, Widal's test (vē-dălz′) [Georges Fernand Isidore Widal, Fr. physician, 1862–1929] An agglutination test for typhoid fever.

wig A covering for the head to simulate hair if the individual is bald or partially bald. Wigs may be made of hair or synthetic fibers such as acrylic. Wigs are esp. beneficial for use by patients who have lost their hair due to exposure to

certain types of cytotoxic agents used in cancer chemotherapy.

wild (wīld) [ME. *wilde*] Occurring in nature.

wild cherry The dried bark of *Prunus serotina,* used principally in the form of syrup as a flavored vehicle for cough medicine.

will [AS.] **1.** The mental faculty used in choosing or deciding on an act or thought. **2.** The power of controlling one's actions or emotions.

Willis' cord One of the cords crossing the superior longitudinal sinus transversely.

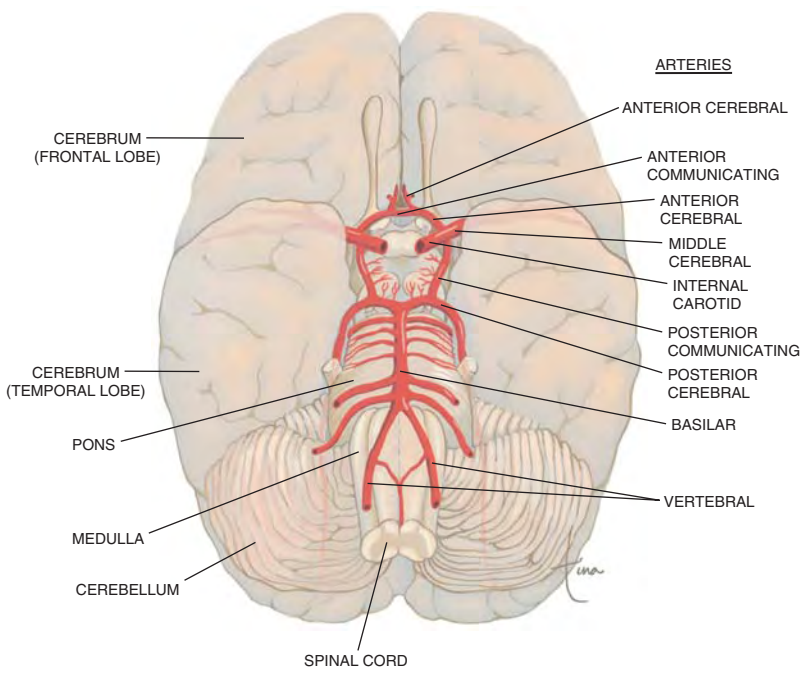
Willis, Thomas (wĭl'ĭs) British anatomist, 1621–1675.

circle of W. An arterial anastomosis that encircles the optic chiasm and hypophysis, from which the principal arteries supplying the brain are derived. It receives blood from the two internal carotid arteries and the basilar artery formed by union of the two vertebral arteries. SEE: illus.

Wilms' tumor (vĭlmz) [Max Wilms, Ger. surgeon, 1867–1918] A rapidly developing tumor of the kidney that usually occurs in children. It is the most common renal tumor of childhood. It is associated with chromosomal deletions, esp. from chromosomes 11 and 16. In the past, the mortality from this type of cancer was extremely high; however, newer approaches to therapy have been very effective in controlling the tumor in about 90% of patients. SYN: *embryonal carcinosarcoma; nephroblastoma*. SEE: *Nursing Diagnoses Appendix.*

Wilson's disease (wĭl'sŭnz) [Samuel Alexander Kinnier Wilson, Brit. internist, 1877–1937] A hereditary syndrome transmitted as an autosomal recessive trait in which a decrease of ceruloplasmin permits accumulation of copper in various organs (brain, liver, kidney, and cornea) associated with increased intestinal absorption of copper. A pigmented ring (Kayser-Fleischer ring) at the outer margin of the cornea is pathognomonic. This syndrome is characterized by degenerative changes in the brain, cirrhosis of the liver, hemolysis, splenomegaly, tremor, muscular rigidity, involuntary movements, spastic contractures, psychic disturbances, dysphagia, and progressive weakness and emaciation. SYN: *hepatolenticular degeneration; Westphal-Strümpell pseudosclerosis*.

TREATMENT: The untreated disease is fatal. The goal is to prevent further copper accumulation in tissues by avoiding foods high in copper such as organ meats, shellfish, nuts, dried legumes, chocolate, and whole cereals. Re-



CIRCLE OF WILLIS
Inferior view of brain

duction of the copper in the tissues is achieved by giving the copper binder, D-penicillamine, orally until the serum copper level returns to normal. Carefully controlled doses of this therapy will probably be required for the patient's entire lifetime. Blood cell counts and hemoglobin should be monitored every 2 weeks during the first 6 weeks of treatment. Nonsteroidal anti-inflammatory drugs or systemic corticosteroids may help to relieve symptoms.

CAUTION: The copper binder, D-penicillamine, may cause pyridoxine and iron deficiency.

Wilson-Mikity syndrome [Miriam G. Wilson, U.S. pediatrician, b. 1922; Victor G. Mikity, U.S. radiologist, b. 1919] A so-called pulmonary dysmaturity syndrome seen in premature infants. The symptoms are insidious onset of dyspnea, tachypnea, and cyanosis in the first month of life. Radiographs of the lungs reveal evidence of emphysema that develops into multicysts. Therapy is directed at the pulmonary insufficiency and cardiac failure. The death rate is about 25%.

windburn Erythema and irritation of the skin caused by exposure to wind. Simultaneous exposure to the sun, moisture, wind, and cold may cause a severe dermatitis.

windchill The cooling effect wind has on exposed human skin. The effect is intensified if the skin is moist or wet.

windchill factor Loss of heat from exposure of skin to wind. Heat loss is proportional to the speed of the wind. Thus, skin exposed to a wind velocity of 20 mph (32 km/hr) when the temperature is 0°F (−17.8°C) is cooled at the same rate as in still air at −46°F (−43.3°C). Similarly, when the temperature is 20°F (−6.7°C) and the wind is 10, 20, or 35 mph (16.1, 32.2, or 56.3 km/hr), the equivalent skin temperature is −4°, −18°, or −28°F (−20°, −27.8°, or −33.3°C), respectively.

The windchill factor is calculated for dry skin; skin that is wet from any cause and exposed to wind loses heat at a much higher rate. Wind blowing over wet skin can cause frostbite, even on a comfortably warm day as judged by the thermometer.

window [Old Norse *vindauga*] **1.** An aperture for the admission of light or air or both. **2.** A small aperture into a cavity, esp. that of the inner ear. SYN: *fenestra*.

aortic w. In radiology, in a left anterior oblique or lateral view of the chest, a clear area bounded by the aortic arch, the bifurcation of the trachea, and the pericardial border.

beryllium w. The part of a radiographic tube through which the x-ray photons pass to the outside.

cochlear w. Round w.

w. level ABBR: WL. In computed tomography, the center of the range of gray scale in the image.

oval w. The opening from the middle ear cavity to the inner ear, over which the plate of the stapes fits; it transmits vibrations for hearing. SYN: *fenestra vestibuli*.

pericardial w. A surgically constructed drainage portal through the pericardium into the peritoneum, used for the relief of pericardial effusions or tamponade.

radiation w. A translucent lead glass window in a radiographic control booth.

radiographic w. A thinner area on the glass envelope of an x-ray tube from which x-rays are emitted toward the patient.

round w. A membrane-covered opening below the oval window. Vibrations in the inner ear cause the membrane to bulge outward, decreasing the pressure in the cochlea and preventing damage to the hair cells. SYN: *fenestra cochleae; fenestra rotunda; cochlear window*.

vestibular w. Oval window.

w. width ABBR: WW. In digital imaging, the number of shades of gray in an image.

windowing Cutting a hole in anything, such as a plaster cast, to relieve pressure on the skin or a bony area.

windpipe (wĭnd′pīp) Trachea.

wine (wīn) [L. *vinum,* wine] **1.** Fermented juice of any fruit, usually made from grapes and containing 10% to 15% alcohol.

red w. An alcoholic beverage made from pressed grapes, which contains polyphenolic antioxidants. Consumption of red wine, not in excess of 1 to 2 glasses per day, is associated with reduced risk of coronary artery disease.

wineglass A fluid measure of approx. 2 fl oz (60 ml).

wine sore Slang term for a superficial infected area of the skin seen in alcoholics with poor personal hygiene; erroneously thought to be due to specific action of the wine.

wing [Old Norse *vaengi*] A structure resembling the wing of a bird, esp. the great and small wings of the sphenoid bone. SEE: *ala*.

wink [AS. *wincian*] The brief, voluntary closure of one eye. In hemiplegia, the patient may not be able to blink or close the eye on the paralyzed side without simultaneously closing the other eye. This is called *Revilliod sign* or *orbicularis sign*. SEE: *blink; Marcus Gunn syndrome*.

winking Wink.

jaw w. SEE: *jaw winking*.

Winslow, foramen of (wĭnz′lō) [Jacob Benignus Winslow, Danish-born Fr. anatomist, 1669–1760] Epiploic foramen.

Winslow, ligament of The oblique popliteal ligament located at the back of the knee.

Winslow, pancreas of The processus uncinatus of the pancreas.

wintergreen oil Methyl salicylate. This colorless, yellowish, or reddish liquid has a characteristic taste and odor. It is used as a flavoring substance and as a counterirritant applied topically in the form of salves, lotions, and ointments.

winter itch A mild form of eczematous dermatitis of the lower legs of elderly persons during dry periods of the year. The skin contains fine cracks and there is no erythema. The skin should be rehydrated with a cream or emulsion of water in oil. SYN: *asteatotic eczema; pruritus hiemalis*.

wire (wīr) **1.** Metal drawn out into threads of varying thickness. **2.** To join fracture fragments together by use of wire.

arch w. A cable, usually made of metal, that is used to apply tension to the teeth in orthodontics.

guide w. A wire used to enter tight spaces (e.g., obstructed valves or channels) within the body.

Kirschner w. SEE: *Kirschner wire*.

separating w. A brass wire used in dentistry to separate teeth before banding them.

wired Slang for tense and anxious, esp. when the condition is caused by the effect of a psychoactive drug.

wiring (wīr′ĭng) Fastening bone fragments together with wire.

circumferential w. A method of treating a fractured mandible by passing wires around the bone and a splint in the oral cavity.

continuous loop w. The forming of wire loops on both mandibular and maxillary teeth to provide attachment sites for rubber bands. These are used in treating fractures of the mandible. SYN: *Stout's wiring*.

craniofacial suspension w. Wiring using bones not contiguous with the oral cavity for attachment of wires that lead from those bones to the fractured jaw segments.

Gilmer w. Wiring of single opposed teeth by use of wire passed circumferentially around the two teeth and the ends twisted together. The twisted ends are placed where they will not irritate adjacent soft tissues. This procedure is used to produce intermaxillary fixation.

Ivy loop w. The placement of wire around adjacent teeth to provide an attachment site for rubber bands.

perialveolar w. The use of wires to fix a splint to the mandible. The wires are passed through the alveolar process from the buccal plate to the palate.

pyriform w. Wiring using the nasal bones to stabilize a fracture of the jaw. The wires are passed through the pyriform aperture of the nasal bone and then to the segment.

silver w. Abnormal reflections of light seen on the ophthalmoscopic examination of the retina of persons with long-standing, uncontrolled hypertension.

Stout's w. Continuous loop w.

Wirsung, duct of (vēr′soong) [Johann Georg Wirsung, Ger. physician, 1600–1643] Pancreatic duct.

wisdom tooth (wĭz′dŏm) The third most distal molar on each side of the jaw. These four molars may appear as late as the 25th year or may never erupt.

Wiskott-Aldrich syndrome (vĭs′kŏt-ăl′drĭch) [Alfred Wiskott, Ger. pediatrician, 1898–1978; Robert A. Aldrich, U.S. pediatrician, b. 1917] An X-linked immune deficiency syndrome whose hallmarks are decreased resistance to infection, eczema, and thrombocytopenia. The number of T lymphocytes in the blood and lymph nodes declines, blood levels of immunoglobulin M class antibodies are reduced, and the response to many antigens is inadequate. If bone marrow transplant is unsuccessful, the patients die at a young age from infection.

withdrawal Cessation of administration of a drug, esp. a narcotic, or alcohol to which the individual has become either physiologically or psychologically addicted. Withdrawal symptoms vary with the type of drug used. Neonates may exhibit withdrawal symptoms from drugs or alcohol ingested by the mother during pregnancy. SEE: *drug addiction*.

caffeine w. SEE: *caffeine; coffee; tea*.

withdrawal syndrome Irritability, autonomic hyperactivity, hallucinations, or other phenomena resulting from the withdrawal of alcohol, stimulants, or some opiates.

opiate perinatal w.s. Intrauterine hyperactivity and increased oxygen consumption associated with opiate withdrawal in infants of addicted mothers. The syndrome places infants at increased risk for meconium aspiration pneumonia and transient tachypnea.

witkop (wĭt′kŏp) [Afrikaans, white scalp] Matted crusts in the hair producing a scalplike structure; seen in South African natives.

Witkop syndrome [C.J. Witkop, 20th cent. Chilean dentist/oral surgeon] Tooth and nail syndrome .

witness A person having knowledge or information about a particular subject or event.

expert w. A qualified person who assists a judge and jury in understanding technical aspects of a lawsuit, such as breaches of the standard of care and damages or injuries sustained.

fact w. A person who has knowledge of circumstances surrounding the events of the alleged incident in a complaint or petition for damages. SYN: *material witness*.

material w. Fact witness.

Witzel jejunostomy (vĭt′zl) [Friedrich O. Witzel, Ger. surgeon, 1865–1925] A jejunostomy created by inserting a rubber or silicone catheter into the jejunum and bringing it to the skin surface. Medication and feedings can be administered on a long-term basis. SEE: *jejunostomy*.

witzelsucht (vĭt′sĕl-zookt) [M. Jastrowitz, Ger. physician, b. 1839] A condition produced by frontal lobe lesions characterized by self-amusement from poor jokes and puns. SEE: *moria*.

primary affective w. A peculiar variety of witzelsucht characterized by teutonization of nomenclature.

Wohlfahrtia (vōl-fär′tē-ă) [Peter Wohlfahrtia, Ger. author, 1675–1726] A genus of flies parasitic in animal tissue, belonging to the family Sarcophagidae, order Diptera.

W. magnifica A species found in southeast Europe. The larvae may occur in human and animal wounds.

W. vigil A species found in Canada and the northern United States.

Wolbachia (wōl-băk′ē-ă) A genus of bacteria that live only inside the cells of host insects. They have been associated with the blindness caused by *Onchocerca volvulus*.

Wolfe's graft A graft using the whole skin thickness.

wolffian body (wool′fē-ăn) [Kaspar Friedrich Wolff, Ger. anatomist, 1733–1794] Mesonephros. SEE: *embryo; paroophoron; parovarium*.

wolffian cyst A cyst lying in one of the broad ligaments of the uterus.

wolffian duct The duct in the embryo leading from the mesonephros to the cloaca. From it develop the ductus epididymis, ductus deferens, seminal vesicle, ejaculatory duct, ureter, and pelvis of the kidney. SYN: *mesonephric duct*.

wolffian tubule One of 30 to 34 tubules that develop within the mesonephros and empty into the mesonephric duct. Most are transitional, persisting for only a short time. Some persist in a men as the efferent ductules of the testis; others persist only as vestigial structures. SYN: *mesonephric tubule*. SEE: *epoophoron; paradidymis; paroophoron*.

Wolff's law Law that states that bones adapt structurally to resist the specific forces acting on them.

Wolff-Parkinson-White syndrome (wŏlf′păr′kĭn-sŏn-wīt′) [Louis Wolff, U.S. cardiologist, 1898–1972; Sir John Parkinson, Brit. physician, 1885–1976; Paul Dudley White, U.S. cardiologist, 1886–1973] ABBR: WPW. A disease manifested by occasional episodes of potentially life-threatening tachycardia, in which there is an abnormal electrical pathway in the heart connecting the atria to the ventricles.

ETIOLOGY: In some families, the disease is transmitted as an autosomal dominant trait.

DIAGNOSIS: In electrocardiography, the P-R interval is less than 0.12 sec and the QRS complex is widened as a result of an initial electrical deflection, called the delta wave.

TREATMENT: Ablation of the abnormal accessory pathway cures about 92% of patients. SEE: *pre-excitation, ventricular*.

wolfram (wool′frăm) Tungsten.

wolfsbane (wŏlfs′bān) Common name for several species of *Aconitum,* a genus of highly toxic, hardy perennials. Also called *monkshood*. SEE: *aconite*.

Wolhynia fever Trench fever.

Wolman's disease [Moshe Wolman, Israeli physician, b. 1914] An autosomal recessive disorder in which infants develop hepatosplenomegaly, calcification of the adrenal glands, and foam cells in the bone marrow and other tissues.

woman An adult human female. SEE: *man*.

battered w. A woman who has been physically or sexually assaulted by her husband, partner, or former partner. Typically verbal abuse precedes physical violence. An escalating pattern of intimidation and injury often results, sometimes culminating in death. Frequently women are reluctant to report this type of abuse because they feel trapped or isolated. Women from any socioeconomic level may be affected. Shelters and support for battered women are available in many locations.

womb (woom) [AS. *wamb*] Uterus.

Wood's rays (wŭdz) [Robert Williams Wood, U.S. physicist, 1868–1955] Ultraviolet rays; used to detect fluorescent materials in the skin and hair in certain disease states such as tinea capitis. The terms Wood's light and Wood's lamp have become synonymous with Wood's rays, even though these are misnomers.

woodruff A low-growing, hardy perennial herb (*Galium odoratum* or *Asperula odorata*) used in alternative medicine to treat nervousness, insomnia, and cardiac irregularity. Liver damage has been reported in some patients after long-term use.

wool fat Anhydrous lanolin, a fatty sub-

stance obtained from sheep's wool; used as a base for ointments. It can produce contact dermatitis in susceptible persons.

woolly hair syndrome A rare congenital disorder in which infants are born with wiry or unusually curly hair; sometimes associated with abnormal heart development. Sometimes found only on hair that grows on nevi.

woolsorter's disease A pulmonary form of anthrax that develops in those who handle wool contaminated with *Bacillus anthracis.* SEE: *anthrax*.

word blindness Alexia.

word deafness Auditory agnosia.

word salad The use of words indiscriminantly and haphazardly, that is, without logical structure or meaning. It is a finding in uncontrolled mania and schizophrenia.

work [Ger. *wirken*] **1.** A force moving a resistance. The amount of work done is the product of the force in the direction of movement times the distance the resisting object is moved. Regardless of the force applied, if the resisting object is not moved, then no work has been done. This is not to say that energy has not been expended. Work is measured in units of force times distance, or newton meters. SEE: *calorie; erg*. **2.** The job, occupation, or task one performs as a means of providing a livelihood. **3.** The effort employed to explore interpersonal or psychological issues.

body w. Musculoskeletal manipulations such as massage, stretching, postural alignment, and breathing exercises that are used to relieve stress, treat pain, and promote a sense of wellness.

social w. Provision of social services (in fields such as child welfare, criminal justice, hospital-based medicine, or mental health) and the promotion of social welfare by a professionally trained person. Social work often involves advocacy and aid for individuals who are poor, elderly, homeless, unemployed, or discriminated against in society because of gender, race, or other biases.

workaholic A colloquial term for a person addicted to occupational or productive pursuits who has difficulty relaxing or enjoying familial, social, or leisure activities.

worker, sex An individual who engages in sexual activities in exchange for payment. SEE: *prostitution*.

workflow The processes involved in completing a job, including such functions as the organization of human or other resources; the design of tasks; the development of procedures (and their implementation), followed by feedback, oversight, and quality improvement.

work hardening A series of conditioning exercises that an injured worker performs in a rehabilitation program. These are designed to simulate the functional tasks encountered on the job to which the individual will return.

working through The combined efforts of a patient and mental health practitioner to understand the basis of behaviors, feelings, symptoms, or thoughts.

workout In athletics, a practice or training session.

workup The process of obtaining all of the necessary data for diagnosing and treating a patient. It should be done in an orderly manner so that essential elements will not be overlooked. Included are retrieval of all previous medical and dental records, the patient's family and personal medical history, social and occupational history, physical examination, laboratory studies, x-ray examinations, and indicated diagnostic surgical procedures. The patient's workup is an ongoing process wherein all hospital personnel involved cooperate in attempting to determine the correct diagnosis and effective therapy. SEE: *charting; medical record, problem-oriented*.

sepsis w. A colloquial term for the evaluation of a patient, esp. a neonate, with a fever, for laboratory evidence of severe infection. Common tests for febrile neonates include a complete blood count; blood cultures, cerebrospinal fluid, urine, and stool samples; and chest x-ray. Most neonates with a fever are given immediate treatment with broad-spectrum antibiotics pending the results of cultures.

World Health Organization ABBR: WHO. The United Nations agency concerned with international health and the eradication of disease.

worm (wŭrm) [AS. *wyrm*] **1.** An elongated invertebrate belonging to one of the following phyla: Platyhelminthes (flatworms); Nemathelminthes or Aschelminthes (roundworms or threadworms); Acanthocephala (spinyheaded worms); and Annelida (Annulata) (segmented worms). SYN: *helminth*. **2.** Any small, limbless, creeping animal. **3.** The median portion of the cerebellum. **4.** Any wormlike structure.

bladder w. Cysticercus.

wormian bone SEE: under *bone*.

wormwood (wĕrm′wood) A toxic substance, absinthium, obtained from *Artemisia absinthium*. It was used in certain alcoholic beverages (absinthe), but because of its toxicity such use is prohibited in most countries.

worried well Persons who are healthy, but who, because of their anxiety or an imagined illness, frequent medical care facilities seeking reassurance concerning their health.

wound (woond) [AS. *wund*] A break in the continuity of body structures caused

by violence, trauma, or surgery to tissues. In treating the nonsurgically created wound, tetanus prophylaxis must be considered. If not previously immunized, the patient should be given tetanus immune globulin.

abdominal w. A wound that damages the abdominal wall and intraperitoneal and extraperitoneal organs and tissues. A careful examination (often including peritoneal lavage, ultrasonography, or computed tomographic scanning of the abdomen) is necessary to determine the precise nature of the injury and the proper course of treatment. Superficial injuries may require no more than ordinary local care; immediate laparotomy may be needed, however, when major bleeding or organ damage has occurred. Intravenous fluids, blood components, antibiotics, and tetanus prophylaxis are given when necessary. Major abdominal trauma may be overlooked in comatose or otherwise critically injured patients when there is no obvious abdominal injury. SEE: *abdomen*.

bullet w. A penetrating wound caused by a missile discharged from a firearm. The extent of injury depends on the wound site and the speed and character of the bullet. SEE: *Nursing Diagnoses Appendix; gunshot w.*

TREATMENT: Tetanus booster injection or tetanus immune globulin and antibiotics, if indicated, should be given. An appropriate bandage should be applied. Emergency surgery may be necessary. Complications, including hemorrhage and shock, should be treated.

contused w. A bruise in which the skin is not broken. It may be caused by a blunt instrument. Injury of the tissues under the skin, leaving the skin unbroken, traumatizes the soft tissue. Ruptured blood vessels underneath the skin cause discoloration. If extravasated blood becomes encapsulated, it is termed hematoma; if it is diffuse, ecchymosis. SEE: *ecchymosis; hematoma*.

TREATMENT: Cold compresses, pressure, and rest, along with elevation of the injured area, will help prevent or reduce swelling. When the acute stage is over (within 24 to 48 hr), continued rest, heat, and elevation are prescribed. Aseptic drainage may be indicated.

crushing w. Trauma due to force applied to tissues so they are disrupted or compressed, but with minimal or no frank lacerations. If there is no bleeding, cold should be applied; if the wound is bleeding, application of the dressing should be followed by cold packs until the patient can be given definitive surgical treatment. If the bone is fractured, a splint should be applied.

fishhook w. An injury caused by a fishhook becoming embedded in soft tissue. Deeply embedded fishhooks are difficult to remove. One should push the hook through, then cut off the barb with an instrument, and pull the remainder of the fishhook out by the route of entry. Antitetanus treatment should be given as indicated. Because these injuries often become infected, prophylactic use of a broad-spectrum antibiotic is indicated.

gunshot w. ABBR: GSW. A penetrating injury from a bullet shot from a gun. At very close range, the wound may have gunpowder deposits and the skin burn marks. GSWs can crush, penetrate, stretch, cavitate, or fracture body structures. The severity of the wound may depend on the structures damaged, the velocity and caliber of the bullet, and the underlying health of the victim. SEE: *bullet w.*

lacerated w. Laceration.

nonpenetrating w. A wound in which the surface of the skin remains intact.

open w. A contusion in which the skin is also broken, such as a gunshot, incised, or lacerated wound. SEE: illus.

penetrating w. A wound in which the skin is broken and the agent causing the wound enters subcutaneous tissue or a deeply lying structure or cavity.

perforating w. Any wound that has breached the body wall or internal organs. The perforation may be partial or complete.

puncture w. A wound made by a sharp-pointed instrument such as a dagger, ice pick, or needle. A puncture wound usually is collapsed, which provides ideal conditions for infection. The placement of a drain, antitetanus therapy or prophylaxis, and gas gangrene prophylaxis may be required. This will depend on the nature of the instrument that caused the injury.

subcutaneous w. A wound, such as contusion, that is unaccompanied by a break in the skin.

tunnel w. A wound having a small entrance and exit of uniform diameter.

wound ballistics The study of the effects on the body produced by penetrating projectiles.

wound healing SEE: *healing; inflammation*.

W-plasty A technique used in plastic surgery to prevent contractures in straight-line scars. Either side of the wound edge is cut in the form of connected W's, and the edges are sutured together in a zigzag fashion. SEE: *tissue expansion, soft; Z-plasty*.

wrap **1.** A covering, esp. one that is wound tightly around an object, as an

OPEN WOUND
An open cavitary wound

elastic wrap or a compression wrap. **2.** To wind a covering around an object.

compression w. An elastic bandage used to prevent or reduce the formation of edema. The wrap is applied starting distally; it uses overlapping spirals to progress proximally. Greater pressure is applied distally than proximally, creating a compression gradient that encourages venous and lymphatic return. SEE: illus.

COMPRESSION WRAP

Wright's stain (rītz) [James H. Wright, U.S. pathologist, 1871–1928] A combination of eosin and methylene blue used in staining blood cells to reveal malarial parasites and to differentiate white blood cells.

wrinkle (rĭng′kl) [AS. *gewrinclian,* to wind] **1.** A crevice, furrow, or ridge in the skin. **2.** To make creases or furrows, as in the skin by habitual frowning.

wrinkle test A test of sensibility following complete transection of or damage to peripheral nerves based on the characteristic sympathetic response of skin following extended immersion in water. SEE: *nerve*.

Wrisberg's cartilages The cuneiform cartilages of the larynx.

Wrisberg's ganglion (rĭs′bŭrgz) [Heinrich August Wrisberg, Ger. anatomist, 1739–1808] A ganglion of the superficial cardiac plexus, between the aortic arch and the pulmonary artery. Also called *Wrisberg's cardiac ganglion*. SYN: *cardiac ganglion*.

Wrisberg's nerve **1.** The medial brachial cutaneous nerve, a branch of the medial cord of the brachial plexus. **2.** The nervus intermedius (pars intermedia), a branch of the facial nerve lying between the motor root and the acoustic nerve.

wrist (rĭst) [AS] The joint or region between the hand and the forearm. SEE: *hand* for illus.; *skeleton*.

wrist drop A condition in which the hand is flexed at the wrist and cannot be extended; may be due to injury of the radial nerve or paralysis of the extensor muscles of the wrist and hand.

wrist unit A component of an upper-extremity prosthesis that attaches the terminal device to the forearm section and provides for pronation or supination.

writing The act of placing characters, letters, or words together for the purpose of communicating ideas.

dextrad w. Writing that progresses from left to right.

mirror w. SEE: *mirror writing*.

wrongful birth, wrongful life The idea that conception would have been prevented or pregnancy would have been interrupted if the parents had been

adequately informed of the possibility that the mother would give birth to a physically or mentally challenged child.

wryneck (rī′nĕk) Torticollis.

w.s. *water-soluble.*

wt *weight.*

Wuchereria (voo″kĕr-ē′rē-ă) [Otto Wucherer, Ger. physician, 1820–1873] A genus of filarial worms of the class Nematoda, commonly found in the tropics.

W. bancrofti A parasitic worm that is the causative agent of elephantiasis. Adults of the species live in human lymph nodes and ducts. Females give birth to sheathed microfilariae, which remain in internal organs during the day but at night are in circulating blood, where they are sucked up by night-biting mosquitoes, in which they continue their development, becoming infective larvae in about 2 weeks. They are then passed on to humans when the mosquito bites. SYN: *Filaria bancrofti*. SEE: illus.

WUCHERERIA BANCROFTI
Microfilaria (×400)

W. malayi A species occurring in Southeast Asia and largely responsible for lymphangitis and elephantiasis in that region. It closely resembles *W. bancrofti.*

wuchereriasis (voo″kĕr-ē-rī′ă-sĭs) Elephantiasis.

w/v *weight in volume.*

w/w *weight in weight.*

X

X Symbol for Kienböck's unit of x-ray dose; symbol for xanthine.

Xalatan Latanoprost.

Xanax Alprazolam.

xanthelasma (zăn″thĕl-ăz′mă) [Gr. *xanthos,* yellow, + *elasma,* plate] A yellow, lipid-rich plaque (a xanthoma) present on the eyelids, esp. near the inner canthus. SEE: illus.

XANTHELASMA

xanthematin (zăn-thĕm′ă-tĭn) A yellow substance produced by the action of nitric acid on hematin.

xanthemia (zăn-thē′mē-ă) [″ + *haima,* blood] Carotenemia.

xanthene (zăn′thēn) A crystalline compound, $O{=}(C_6H_4)_2{=}CH_2$, from which various dyes are formed, including rhodamine and fluorescein.

xanthic (zăn′thĭk) [Gr. *xanthos,* yellow] **1.** Yellow. **2.** Pert. to xanthine.

xanthine (zăn′thĭn, -thēn) A nitrogenous compound present in muscle tissue, liver, spleen, pancreas, and other organs, and in the urine. It is formed during the degradation of adenosine monophosphate to uric acid.

dimethyl-x. Theobromine.

xanthine base A group of chemical compounds including xanthine, hypoxanthine, uric acid, and theobromine, which have a purine as their base. SYN: *purine base*.

xanthinuria, xanthiuria (zăn″thē-ū′rē-ă) The excretion of large amounts of xanthine in the urine. SYN: *xanthuria*.

xanthochromia (zăn″thō-krō′mē-ă) [″ + *chroma,* color] Yellow discoloration, as of the skin in patches or of the cerebrospinal fluid, resembling jaundice.

xanthochromic (zăn″thō-krō′mĭk) **1.** Pert. to anything yellow. **2.** Pert. to xanthochromia.

xanthocyanopia, xanthocyanopsia (zăn″thō-sī-ăn-ŏ′pē-ă, -ŏp′sē-ă) [Gr. *xanthos,* yellow, + *kyanos,* blue, + *opsis,* sight] A form of color blindness in which yellow and blue are distinguishable, but not red and green. SYN: *xanthokyanopy*.

xanthocyte (zăn′thō-sīt) [″ + *kytos,* cell] A cell containing yellow pigment.

xanthoderma (zăn″thō-dĕr′mă) [″ + *derma,* skin] Yellowness of the skin.

xanthodont (zăn′thō-dŏnt) [″ + *odous,* tooth] An individual who has yellow teeth.

xanthogranuloma (zăn″thō-grăn″ū-lō′mă) [″ + L. *granulum,* grain, + *oma,* tumor] A tumor having characteristics of both an infectious granuloma and a xanthoma.

juvenile x. A skin disease that may be present at birth or develop in the first months of life. Firm dome-shaped yellow, pink, or orange papules, ranging from a few millimeters to 4 cm in diameter, are usually present on the scalp, face, and upper trunk. Biopsy of these lesions reveals lipid-filled histiocytes, inflammatory cells, and Touton giant cells (multinucleated vacuolated cells with a wreath of nuclei and peripheral rim of foamy cytoplasm). The lesions regress spontaneously during the first years of life. Juvenile xanthogranuloma of the iris is one of the most common causes of bleeding into the anterior chamber of the eye in childhood.

xanthokyanopy (zăn″thō-kī-ăn′ō-pē) [″ + *kyanos,* blue, + *opsis,* sight] Xanthocyanopia.

xanthoma (zăn-thō′mă) [Gr. *xanthos,* yellow, + *oma,* tumor] Soft, yellow skin plaques or nodules that contain deposits of lipoproteins inside histiocytes; they are esp. likely to be found on the skin of patients with hyperlipidemia.

diabetic x. A yellow fatty skin deposit associated with uncontrolled diabetes mellitus.

x. disseminatum A condition characterized by the presence of xanthomata throughout the body, esp. on the face, in tendon sheaths, and in mucous membranes. SEE: *Hand-Schüller-Christian disease*.

x. multiplex Xanthomata all over the body.

x. palpebrarum Xanthoma affecting the eyelids.

x. tuberosum A form of xanthoma that may appear on the neck, shoulders, trunk, or extremities, consisting of small elastic and yellowish nodules.

xanthomatosis (zăn″thō-mă-tō′sĭs) [″ + ″ + *osis,* condition] A condition in

which there is a deposition of lipid in tissues, usually accompanied by hyperlipemia. Cholesterol may accumulate in tumor nodules (xanthoma) or in individual cells, esp. histiocytes and reticuloendothelial cells.

xanthomatous (zăn-thō′mă-tŭs) Concerning xanthoma.

Xanthomonas maltophilia (zăn-thō′mŏnăs) Former name for *Stenotrophomonas maltophilia*.

xanthophose (zăn′thō-fōz) [″ + *phos,* light] Any yellow phose. SEE: *phose*.

xanthophyll (zăn′thō-fĭl) [″ + *phyllon,* leaf] A yellow pigment derived from carotene. It is present in some plants and egg yolk.

xanthoprotein (zăn″thō-prō′tē-ĭn) A yellow substance produced by heating proteins with nitric acid.

xanthopsia (zăn-thŏp′sē-ă) [″ + *opsis,* sight] A condition in which objects appear to be yellow.

xanthopsis (zăn-thŏp′sĭs) A yellow pigmentation seen in certain cancers and degenerating tissue.

xanthosis (zăn-thō′sĭs) [″ + *osis,* condition] A yellowing of the skin seen in carotenemia resulting from ingestion of excessive quantities of carrots, squash, egg yolk, and other foods containing carotenoids. The condition is usually harmless, but it may indicate an increase of lipochromes in the blood caused by other conditions such as hypothyroidism, diabetes, or a malignancy.

xanthous (zăn′thŭs) [Gr. *xanthos,* yellow] Yellow.

xanthurenic acid (zăn-thū-rēn′ĭk) An acid, $C_{10}H_7NO_4$, excreted in the urine of pyridoxine-deficient animals after they are fed tryptophan. Also called 4,8-dihydroxyquinaldic acid.

xanthuria (zăn-thū′rē-ă) [″ + *ouron,* urine] Xanthinuria.

x-disease Poisoning caused by ingestion of peanuts or peanut products contaminated with *Aspergillus flavus* or other *Aspergillus* strains that produce aflatoxin. Farm animals and humans are susceptible to this toxicosis. SYN: *aflatoxicosis*.

Xe Symbol for the element xenon.

xeno- [Gr. *xenos,* stranger] Combining form indicating *strange, foreign.*

xenobiotic (zĕn″ō-bī-ŏt′ĭk) An antibiotic not produced by the body, and thus foreign to it.

xenodiagnosis (zĕn″ō-dī″ăg-nō′sĭs) [″ + ″] The diagnosis of parasitic infection in humans or animals using an intermediate host such as an insect as a culture tool. Uninfected insects are allowed to feed on the infected person. The insects are subsequently tested for the presence of infection, e.g., Chagas' disease or leishmaniasis, a few days or weeks later.

xenogeneic (zĕn″ō-jĕn-ā′ĭk) [″ + *gennan,* to produce] Obtained from a different species. Antigenically foreign.

xenogenous (zĕn-ŏj′ĕn-ŭs) [Gr. *xenos,* stranger, + *gennan,* to produce] **1.** Caused by a foreign body. **2.** Originating in the host, as a toxin resulting from stimuli applied to cells of the host.

xenograft (zĕn′ō-grăft) [″ + L. *graphium,* stylus] A surgical graft of tissue from an individual of one species to an individual of a different species. SYN: *heterograft*.

xenomenia (zĕn-ō-mē′nē-ă) [″ + *meniaia,* menses] Menstruation from a part of the body other than the uterus. SYN: *stigmata; menstruation, vicarious*. SEE: *endometriosis*.

xenon (zē′nŏn) [Gr. *xenos,* stranger] SYMB: Xe. A gaseous element; atomic weight, 131.29; atomic number, 54. Xenon can be used as an (expensive) anesthetic agent. It is neither explosive nor inflammatory, and it is analgesic and hypnotic. It has no teratogenic effects, does not suppress cardiac function, and has a short recovery time.

PATIENT CARE: Radioactive isotopes of xenon, including Xe^{133} and Xe^{127}, are used in ventilation/perfusion ("V/Q") lung scans to diagnose pulmonary embolism. The xenon gas is the ventilation agent in the study, i.e., the agent that highlights how well gases move in and out of lung tissues. An isotope of technetium is used to demonstrate pulmonary blood flow.

xenoparasite (zĕn″ō-păr′ă-sīt) An ectoparasite of a weakened animal, one that would not normally serve as a host.

xenophobia (zĕn″ō-fō′bē-ă) [″ + *phobos,* fear] Abnormal dread of strangers.

xenophonia (zĕn″ō-fō′nē-ă) [″ + *phone,* voice] Alteration in accent and intonation of a person's voice resulting from a speech defect.

xenophthalmia (zĕn″ŏf-thăl′mē-ă) [″ + *ophthalmia,* eye inflammation] Inflammation of the eye caused by a foreign body.

Xenopsylla (zĕn″ŏp-sĭl′ă) [″ + *psylla,* flea] A genus of fleas belonging to the family Pulicidae, order Siphonaptera.

X. cheopis The rat flea; other hosts include humans. This species is a vector for a number of pathogens including *Hymenolepis nana,* the dwarf tapeworm; *Salmonella* organisms; the causative organisms of bubonic and sylvatic plague and endemic typhus.

xenotransplantation (zĕn″ō-trăns″plăntā′shŭn) Transplantation of animal tissues or organs into humans.

xerantic (zē-răn′tĭk) [Gr. *xeros,* dry] Causing dryness. SYN: *siccant; siccative*.

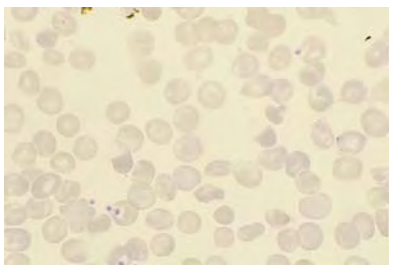
xerasia (zē-rā′sē-ă) [Gr. *xeros,* dry] A disease of the hair in which there is ab-

normal dryness and brittleness, and eventually hair loss.

xero- Combining form meaning *dry*.

xerocheilia (zē″rō-kī′lē-ă) [″ + *cheilos,* lip] Dryness of the lips; a type of cheilitis.

xerocyte (zē′rō-sīt) An erythrocyte that is dehydrated and appears to have "puddled" at one end, seeming half dark and half light. This type of cell is found in hereditary xerocytosis. SEE: illus.; *xerocytosis, hereditary*.



XEROCYTES

xerocytosis, hereditary (zē″rō-sī-tō′sĭs) A disorder of erythrocytes usually inherited as an autosomal dominant trait. A membrane defect in the red blood cells permits the loss of excess potassium ions and water, causing dehydration of the cells. Hemolysis and anemia range from mild to severe. SEE: *xerocyte* for illus.

xeroderma (zē″rō-dĕr′mă) [″ + *derma,* skin] Roughness and dryness of the skin; mild ichthyosis.

x. pigmentosum A rare, progressive, autosomal recessive, degenerative disease characterized by severe photosensitivity developing in the first years of life. There is rapid onset of erythema, bullae, pigmented macules, hypochromic spots, and telangiectasia. The skin becomes atrophic, dry, and wrinkled. A variety of benign and malignant growths appear early in life. The condition is treated symptomatically and sunlight is avoided. SYN: *Kaposi's disease; melanosis lenticularis*.

xerography (zē-rŏg′ră-fē) Xeroradiography.

xeroma (zē-rō′mă) [″ + *oma,* tumor] Xerophthalmia.

xeromammography (zē″rō-măm-mŏg′ră-fē) Xeroradiography of the breast.

xeromycteria (zē″rō-mĭk-tē′rē-ă) [″ + *mykter,* nose] Dryness of the nasal passages.

xerophthalmia (zē-rŏf-thăl′mē-ă) [″ + *ophthalmos,* eye] Conjunctival dryness with keratinization of the epithelium following chronic conjunctivitis and in disease caused by vitamin A deficiency. SYN: *xeroma; xerophthalmus*. SEE: *Schirmer's test*.

xerophthalmus (zē″rŏf-thăl′mŭs) Xerophthalmia.

xeroradiography (zē″rō-rā″dē-ŏg′ră-fē) A method of photoreproduction used in radiography. It is a dry process involving the use of metal plates covered with a powdered substance, such as selenium, electrically and evenly charged. The x-rays alter the charge of the substance to varying degrees, depending on the tissues they have traversed. This produces the image. This procedure has been replaced by film and screen mammography because of its high radiation dose.

xerosis (zē-rō′sĭs) [Gr.] Abnormal dryness of the skin, mucous membranes, or conjunctiva. SEE: illus. **xerotic,** *adj.*

XEROSIS

xerostomia (zē″rō-stō′mē-ă) [″ + *stoma,* mouth] Dry mouth.

xerotocia (zē″rō-tō′sē-ă) [″ + *tokos,* birth] Dry labor caused by a diminished amount of amniotic fluid.

-ximab (zī′măb″) [from the shape of the Gr. letter chi (X) in "chimera" as if it were a Latin "X" + monoclonal antibody] A combining form for *chimeric monoclonal antibody*. Unlike monoclonal antibodies made from humanized sources (-zumabs), -ximabs usually elicit a neutralizing antibody response in a patient who receives them.

xiphi-, xipho-, xiph- Combining forms meaning *sword-shaped, xiphoid*.

xiphisternum (zĭf″ĭ-stĕr′nŭm) [Gr. *xiphos,* sword, + *sternon,* chest] Xiphoid process.

xiphocostal (zĭf″ō-kŏs′tăl) [″ + L. *costa,* rib] Rel. to the xiphoid process and ribs.

xiphodynia (zĭf″ō-dĭn′ē-ă) [″ + *odyne,* pain] Pain in the xiphoid process.

xiphoid (zĭf′oyd) [Gr. *xiphos,* sword, + *eidos,* form, shape] Sword-shaped. SYN: *ensiform; gladiate*.

xiphoiditis (zĭf″oyd-ī′tĭs) [″ + ″ + *itis,*

inflammation] Inflammation of the xiphoid process.

xiphoid process The lowest portion of the sternum; a sword-shaped cartilaginous process supported by bone. No ribs attach to the xiphoid process; however, some abdominal muscles are attached. The xiphoid process ossifies in the aged. SYN: *xiphisternum*. SEE: *sternum* for illus.

xiphopagotomy (zī-fŏp″ă-gŏt′ō-mē) Surgical separation of twins joined at the xiphoid process.

xiphopagus (zī-fŏp′ă-gŭs) [″ + *pagos,* thing fixed] Symmetrical twins joined at the xiphoid process.

X-linked (x′lĭnkt) Denoting characteristics that are transmitted by genes on the X chromosome.

X-linked disorder A disease caused by genes located on the X chromosome. SEE: *choroideremia; hemophilia*.

x radiation SEE: under *radiation*.

x-ray **1.** Electromagnetic radiation having a wavelength between 0.1 and 100 angstrom units. **2.** A term commonly but loosely used to signify an image of a part of the body made with electromagnetic radiation. The formal synonym for this colloquial usage is radiograph.

x-ray photon An uncharged particle of energy, moving in waves produced by the interaction of high-speed electrons with a target (commonly tungsten). These particles vary from those of lower energy (1 to 0.1 A.U.), used in diagnostic imaging, to those of higher energy (0.1 to 10^{-4} A.U.), used in therapy. SYN: *roentgen ray*.

xylene (zī′lēn, zī-lēn′) A mixture of isomeric dimethylbenzenes used in making lacquers and rubber cement. SYN: *xylol*.

xylene poisoning SEE: under *poisoning*.

xylenol (zī′lĕ-nŏl) General name for a series of dimethylphenols found in the pine-type coal tar disinfectants.

xylitol (zī′lĭ-tŏl) A five-carbon sugar alcohol that has a sweet taste and has chemical properties similar to those of sucrose. It may be used in place of sucrose as a sweetener. The use of xylitol in the diet might reduce tooth decay in children.

xylol (zī′lŏl) Xylene.

xylose (zī′lōs) [Gr. *xylon,* wood] Wood sugar, a crystalline, nonfermentable pentose.

xylulose (zī′lū-lōs) A pentose sugar present in nature as L-xylulose. It appears in the urine in essential pentosuria and in the form of D-xylulose.

xylyl (zī′lĭl) A radical, $CH_3C_6H_4CH_2$—, formed by the removal of a hydrogen atom from xylene.

xyrospasm (zī′rō-spăzm) [Gr. *xyron,* razor, + *spasmos,* a convulsion] An occupational spasm or overuse syndrome involving the fingers and arms; seen in barbers.

xyster (zĭs′tĕr) [Gr., scraper] Raspatory.

Y

Y Symbol for the element yttrium.

Yale brace A lightweight orthotic used to stabilize the cervical spine (i.e. after vertebral fracture). It consists of a cervical collar with supports that hold the collar firmly on the chest and upper back.

Yankauer suction catheter (yăng′kow-ĕr) A rigid suction tip used to aspirate secretions from the oropharynx.

yard [AS. *gerd,* a rod] A measure of 3 ft or 36 in.; equal to 0.9144 m. SEE: *Weights and Measures Appendix*.

yawn (yawn) [AS. *geonian*] To open the mouth involuntarily and take a deep breath, a movement mediated by neurotransmitters in the hypothalamus and often associated with stretching.

yawning (yawn′ĭng) Deep inspiration with the mouth wide open. It is associated with drowsiness, boredom, anxiety, or fatigue, and in some animals, penile erection. SEE: *pandiculation*.

yaws (yawz) An infectious nonvenereal disease caused by a spirochete, *Treponema pertenue,* and mainly found in humid, equatorial regions. The disease is marked by fevers, joint pains, and caseating eruptions on the hands, feet, face, and external genitals. The infection is rarely, if ever, fatal but can be disfiguring and disabling. It is treated with penicillin. SYN: *frambesia; pian*.

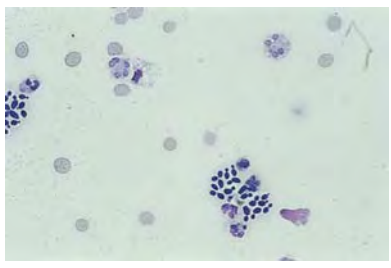
mother y. A papilloma that is the initial lesion of yaws, occurring at the site of inoculation 3 to 4 weeks after infection. This lesion persists for several weeks or months and is painless unless there is a secondary infection. SYN: *frambesioma*.

Yb Symbol for the element ytterbium.

Y-connector A glass or plastic connector that divides one incoming line into two outgoing ones.

years of life lost The number of years a person is estimated to have remained alive if the disease experienced had not intervened.

yeast (yēst) [AS. *gist*] **1.** Any of several unicellular fungi of the genera *Saccharomyces* or *Candida,* which reproduce by budding. They are capable of fermenting carbohydrates. Yeasts, esp. *Candida albicans,* may cause systemic infections as well as vaginitis and oral thrush. Yeast infections are frequently present in patients with malignant lymphomas, poorly controlled diabetes mellitus, AIDS, or other conditions causing immunocompromise. SEE: illus.; *Candida; candidiasis; fungi*. **2.** A commercial product composed of meal impregnated with living fungi, used, for example, in fermenting beer and ale and baking bread.



BUDDING YEAST
(In peritoneal fluid (×400)

brewer's y. Yeast obtained during the brewing of beer. It may be used in the dried form as a source of vitamin B.

dried y. Dried yeast cells from strains of *Saccharomyces cerevisiae*. It is used as a source of proteins and vitamins, esp. B complex.

yellow (yĕl′ō) [AS. *geolu*] One of the primary colors resembling that of a ripe lemon.

visual y. A retinal pigment.

yellow body Corpus luteum.

yellow fever One of two forms of an acute, infectious disease caused by a flavivirus and transmitted by the *Aedes* mosquito. It is endemic in Western Africa, Brazil, and the Amazon region of South America but is no longer present in the U.S.

There are two forms of yellow fever: urban, in which the transmission cycle is mosquito to human to mosquito; and sylvan, in which the reservoir is wild primates.

According to the World Health Organization, yellow fever afflicts about 200,000 people a year in Africa and South America, about 30,000 of whom die.

ETIOLOGY: The virus is carried most commonly by the *Aedes aegypti* mosquito, but the *Aedes vittatus* and *Aedes taylori* mosquitoes also are important vectors.

SYMPTOMS: After an incubation period of 3 to 6 days, patients develop high fever, headache, muscle aches, nausea and vomiting, and gastrointestinal disturbances such as diarrhea or constipation. In most patients, the disease resolves in 2 or 3 days, but in about 20% the fever returns after a 1 to 2 day re-

mission period and is accompanied by abdominal pain, severe diarrhea, gastrointestinal bleeding (producing a characteristic "black vomit"), anuria, and jaundice (from which the name "yellow fever" was derived) caused by liver infection. Rarely, there is progressive liver failure, renal failure, and death.

Yellow fever can be distinguished from dengue by the presence of jaundice, and from malaria by the absence of splenomegaly and low serum transaminase levels. Blood tests can identify the virus and its antigens, to which antibodies are formed in 5 to 7 days. A liver biopsy to isolate the virus is contraindicated because of the risk of bleeding.

LABORATORY FINDINGS: As in many viral infections, the white blood cell count and platelet count may be suppressed. The erythrocyte sedimentation rate is rarely elevated. In severely ill patients with jaundice or renal failure, the serum bilirubin and creatinine levels are elevated.

DIAGNOSIS: Diagnosis on clinical grounds alone is almost impossible during the period of infection or in atypical mild forms. Yellow fever viral antigen or antibodies may be detected during the acute phase of the illness.

PROPHYLAXIS: Preventive measures include mosquito control by screening, spraying with nontoxic insecticides, and destruction of breeding areas. Yellow fever vaccine prepared from the 17D strain is available for those who plan to travel or live in areas where the disease is endemic. The vaccine is contraindicated in the first 4 months of life and the first trimester of pregnancy.

TREATMENT: No antiviral agents are effective against the yellow fever virus. Fluids are given to maintain fluid and electrolyte balance, acetaminophen to reduce fever, and histamine blockers (e.g., ranitidine) or gastric acid pump inhibitors (e.g., omeprazole) to decrease the risk of gastrointestinal bleeding. Vitamin K is given if there is decreased production of prothrombin by the liver.

A live virus vaccine, which can be obtained only at designated vaccination centers, may be given to adults and children over age 9 months who are traveling to countries where yellow fever is endemic; the vaccine is effective for 10 years, after which a booster is required. Persons who are immunosuppressed, pregnant, or allergic to eggs should not receive the vaccine. Travelers need to determine if the country they are visiting has regulations about vaccination.

PROGNOSIS: The prognosis is grave. Mortality is 5% for natives of an area where the disease is endemic.

yellow nail syndrome A condition marked by slowing of nail growth marked by yellowish discoloration, bilateral lymphedema, and recurrent pleural or pericardial effusions. It is typically found in persons with underlying autoimmune, lymphatic, or malignant diseases.

Yergason's test A test used to identify subluxation of the long head of the biceps brachii muscle from the bicipital groove caused by disruption of the transverse humeral ligament. The patient is seated, the glenohumeral joint is in the anatomical position, the elbow flexed to 90 degrees, and the forearm supinated to assume the "palm up" position. The evaluator resists the patient as the shoulder is externally rotated and the elbow flexed. A positive test result is marked by a "snapping" sensation as the long head of the biceps brachii subluxates from the bicipital groove, indicating a tear of the transverse humeral ligament.

Yersinia (yĕr-sĭn′ē-ă) [Alexandre Emil Jean Yersin, Swiss bacteriologist who worked in Paris, 1863–1943] A genus of gram-negative coccobacilli of the family Enterobacteriaceae; several are human pathogens.

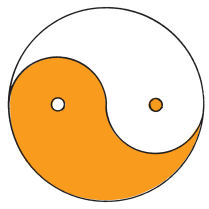
Y. enterocolitica A species that causes acute mesenteric lymphadenitis and enterocolitis. The disease may progress to a septicemic form in children, and mortality may be as high as 50%. Therapy with trimethoprim-sulfamethoxazole, aminoglycosides, tetracycline, third-generation cephalosporin, or quinolones is effective.

Y. pestis The species that causes bubonic and pneumonic plague. SEE: *plague*.

Y. pseudotuberculosis A species that causes pseudotuberculosis in humans.

yersiniosis (yĕr-sĭn″ē-ō′sĭs) Infection with *Yersinia* organisms.

yin-yang (yĭn-yăng) The Chinese symbol of presumptively opposing but complementary entities or concepts such as light-dark, male-female, and sun-moon. In traditional Chinese philosophy and medicine, the goal is to have a proper balance of such forces. SEE: illus.



YIN-YANG

-yl [Gr. *hyle,* matter, substance] Suffix signifying a radical in chemistry.

-ylene Suffix denoting a bivalent hydrocarbon radical in chemistry.

yoga [Sanskrit, union] A system of traditional Hindu beliefs, rituals, and activities that aims to provide spiritual enlightenment and self-knowledge. In the Western world, the term has been associated primarily with physical postures (asanas) and coordinated, diaphragmatic breathing. Many practitioners of complementary medicine use yoga to treat chronic musculoskeletal pain, anxiety, insomnia, and other conditions.

yogurt, yoghurt (yōg′hŭrt) [Turkish] A form of curdled milk created by culturing milk with *Lactobacillus bulgaricus*. Yogurt is a source of calcium and protein that is palatable. It may be better tolerated than milk in persons with lactase deficiency. Yogurt with live cultures may also be useful for replenishing the intestinal flora that have been eliminated following a course of antibiotics. SEE: *milk*.

yohimbine (yō-hĭm′bēn) An alkaloid derived from the bark of the tree *Corynanthe yohimbi*. It is an alpha-adrenergic blocking agent that in excess causes antidiuresis, increased blood pressure, tachycardia, irritability, tremor, sweating, dizziness, nausea, and vomiting. It is used therapeutically to treat erectile dysfunction.

yoke (yōk) A tissue connecting two structures.

yolk (yōk) [AS. *geolca*] The contents of the ovum; sometimes only the nutritive portion. SYN: *vitellus*. SEE: *zona pellucida*.

y. stalk The duct that connects the embryonic gut to the yolk sac; it disappears during fetal development. SYN: *omphalomesenteric duct; umbilical duct; vitelline duct*.

Young-Helmholtz theory (yŭng-hĕlm′hōlts) [Thomas Young, Brit. physician, 1773–1829; Hermann Ludwig Ferdinand von Helmholtz, Ger. physician, 1821–1894] The theory that color vision depends on three different sets of retinal fibers responsible for perception of red, green, and violet. The loss of red, green, or violet as color perceptive elements in the retina causes an inability to perceive a primary color or any color of which it forms a part.

youth (yooth) [AS. *geoguth*] The period between childhood and maturity. Young adulthood is between 18 and 35 years of age.

ypsiliform (ĭp-sĭl′ĭ-form) Y-shaped.

y.s. *yellow spot* of the retina.

ytterbium (ĭ-tŭr′bē-ŭm) SYMB: Yb. A rare metallic earth element used in screens in radiography; atomic weight, 173.04; atomic number, 70.

yttrium (ĭt′rē-ŭm) SYMB: Y. A metallic element; atomic weight, 88.905; atomic number, 39.

Yura, Helen A U.S. nurse-educator and author who published the first comprehensive text on the nursing process with Mary B. Walsh in 1967. SEE: *nursing process; Nursing Theory Appendix*.

yushi (yū′shē) Minamata disease.

Z

Z **1.** Ger. *Zuckung,* contraction. **2.** Symbol for atomic number.

z *zero; zone.*

Z-79 Committee of the American National Standards Institute A committee that develops standards for anesthetic and ventilatory equipment. The label "Z-79" signifies that a device meets the established standard.

zafirlukast (zăf-fĕr-lūk′ăst) A leukotriene inhibitor used to treat asthma. Trade name is Accolate.

Zaglas' ligament (zăg′glŭs) The part of the posterior sacroiliac ligament from the posterosuperior spinous process of the ilium to the side of the sacrum.

Zahn's line (zŏnz) [Frederick W. Zahn, Ger. pathologist, 1845–1904] One of the transverse whitish marks on the free surface of a thrombus made by the edges of layered platelets.

zalcitabine (zăl-cī′tă-bēn) ABBR: ddc. A nucleoside analogue reverse transcriptase inhibitor used in the treatment of HIV-1.

Zantac Ranitidine.

Zavanelli maneuver (zăv″vă-nĕl′ē) In obstetrics, the manual return of the head of a partially born fetus with intractable shoulder dystocia to the vagina. This is followed by cesarean section.

Z disk A thin, dark disk that transversely bisects the I band (isotropic band) of a striated muscle fiber. The thin filaments, made primarily of actin, are attached to the Z disk; the area between the two Z disks is a sarcomere, the unit of contraction. SYN: *Krause's membrane; Z line*.

ZDV Zidovudine.

zea (zē′ă) Maize or corn.

zeatin (zē′ă-tĭn) A cytotoxin that can be isolated from sweet corn.

zeaxanthin (zē″ă-zăn′thĭn) A pigmented antioxidant (a member of the carotenoid family) that is found in broccoli, corn, leafy green vegetables, and squash. Consumption of zeaxanthin-rich foods has been associated with a decreased risk of age-related macular degeneration, among other illnesses.

zein (zē′ĭn) [Gr. *zeia,* a kind of grain] A protein obtained from maize. It is deficient in tryptophan and lysine.

Zeis' gland (tsīs) [Eduard Zeis, Ger. ophthalmologist, 1807–1868] One of the sebaceous glands of the eyelid, close to the free edge of the lid. Each gland is associated with an eyelash. SEE: *Moll's glands*.

zeisian (zī′sē-ăn) Pert. to something originally described by Eduard Zeis.

zeitgeber (tsīt′gā″bĕr) [German *zeitgeber,* timekeeper] Any of the mechanisms in nature that keep internal biological clocks synchronized (entrained) with the environment. Zeitgebers can be physical, involving light or temperature (e.g., sunrise, sunset), or social, involving regular activities (e.g., consistent mealtimes).

zeitgeist (tsīt′gīst) [German] The spirit of the people, or trend of thought at a particular time.

zelotypia (zē″lō-tĭp′ē-ă) [Gr. *zelos,* zeal, + *typtein,* to strike] **1.** Morbid or monomaniacal zeal in the interest of any project or cause. **2.** Insane jealousy.

Zenker, Friedrich Albert von (zĕng′kĕr) German pathologist, 1825–1898.

Z.'s degeneration A glassy or waxy hyaline degeneration of skeletal muscles in acute infectious diseases, esp. in typhoid. SYN: *zenkerism*.

Z.'s diverticulum Herniation of the mucous membrane of the esophagus through a defect in the wall of the esophagus. The location is usually in the posterior hypopharyngeal wall. Small diverticuli are asymptomatic. Large ones trap food and may cause esophageal obstruction, dysphagia, or the regurgitation of food. Treatment is surgical or endoscopic.

Zenker's fluid [Konrad Zenker, 19th-century Ger. histologist] A tissue fixative consisting of mercuric chloride, potassium dichromate, glacial acetic acid, and water. It is used to examine cells, and particularly nuclei, in detail.

zenkerism (zĕng′kĕr-ĭzm) Zenker's degeneration.

zero (zē′rō) [It.] **1.** Corresponding to nothing. SYMB: 0. **2.** The point from which the graduation figures of a scale commence.

On the Celsius scale for example, zero (0°) is the temperature of melting ice. SEE: *thermometer*.

absolute z. The temperature at which all molecular motion (translational, vibrational, rotational) ceases. It is the lowest possible temperature, −273.15°C or −459.6°F; equal to zero degrees Kelvin.

limes z. SYMB: L0. The greatest amount of toxin that, when mixed with one unit of antitoxin and injected into a guinea pig weighing 250 g, will cause no local edema.

zero population growth ABBR: ZPG. The demographic equilibrium in which in a given period of time the population

neither increases nor decreases, that is, the death and birth rates are equal.

zero-sum game A game in which the sum of the wins is equal to the sum of the losses. In such a game, every victory by one party results in equivalent losses by other participants.

Ziehl-Neelsen method (zēl-nēl′sĕn) [Franz Ziehl, Ger. bacteriologist, 1857–1926; Friedrich Karl Adolf Neelsen, Ger. pathologist, 1854–1894] A method for staining *Mycobacterium tuberculosis*. A solution of carbolfuchsin is applied, which the organism retains after rinsing with acid alcohol.

Zieve's syndrome (zēvz) [L. Zieve, U.S. physician, b. 1915] Hyperlipidemia, jaundice, hemolytic anemia, and abdominal pain following the intake of a large amount of alcoholic beverages.

ZIFT *zygote intrafallopian transfer*.

Zim jar opener (zĭm) Trademarked name for a variety of devices allowing one-handed opening of bottles and jars for persons with disability.

zinc (zĭnk) [L. *zincum*] SYMB: Zn. A bluish-white, crystalline metallic element that boils at 906°C; atomic weight, 65.37; atomic number, 30; specific gravity, 7.13. It is found as a carbonate and silicate, known as calamine, and as a sulfide (blende). Dietary sources are meat, including liver; eggs; seafood; and, to a lesser extent, grain products.

FUNCTION: Zinc is an essential dietary element for animals, including humans. It is involved in most metabolic pathways. The recommended dietary intake is 12 to 15 mg of zinc daily for adults, 19 mg daily during the first 6 months of pregnancy, and 5 mg daily for infants.

DEFICIENCY SYMPTOMS: Loss of appetite, growth retardation, hypogonadism and dwarfism, skin changes, immunological abnormalities, altered rate of wound healing, and impaired taste characterize this condition. Zinc deficiency during pregnancy may lead to developmental disorders in the child.

z. acetate White, pearly crystals; used as an astringent, antiseptic, contraceptive, and copper-binding compound.

z. bacitracin SEE: *bacitracin, zinc*.

z. cadmium sulfide A fluorescent material used in radiographic screens.

z. carbonate A mild astringent used topically in dusting powders.

z. chloride A white granular powder used as an antiseptic. It is corrosive. Inhalation of zinc chloride smoke may cause damage to the airways.

z. finger A small protein that can be constructed to bind to specific DNA sequences within genes.

z. gelatin A combination of zinc oxide, glycerin, and purified water. This smooth jelly is placed between layers of gauze dressing to serve as a protective dressing and to support varicosities. It is removed by soaking in warm water.

z. oxide A very fine white powder of zinc. It is slightly antiseptic and astringent and is used chiefly in the form of ointment containing 20% zinc oxide. SYN: *white zinc*.

z. oxide and eugenol Two substances that react together to produce a relatively hard mass, used in dentistry for impression material, cavity liners, sealants, temporary restorations, and cementing layers.

z. salts A bluish-white metal used to make various containers and also to galvanize iron to prevent rust. The most commonly used compounds are zinc oxide as a pigment for paints and ointments. The salts also are used as a wood preservative, in soldering, in medicine to neutralize tissue, and in dilute solutions as an astringent and emetic.

z. stearate A very fine smooth powder used as a nonirritating antiseptic and astringent for burns and abrasions.

z. sulfate An astringent agent used as a 0.25% solution for temporary relief of minor eye irritation.

z. undecylenate An antifungal agent used in treating fungal infection of the feet.

white z. Zinc oxide.

zinciferous (zĭng-kĭf′ĕr-ŭs) Containing zinc.

Zingiberis rhizoma, Zingiberis oficinale (zĭng-ĭ′bĕr-ĭs rī-zō′mă, zĭn-jĭ′) [L. fm Gr., root-mass ginger] The scientific name for ginger root.

Zinn's ligament (zĭnz) [Johann G. Zinn, Ger. anatomist, 1727–1759] Connective tissue giving attachment to the rectus muscles of the eyeball. SEE: *zonule of Zinn*.

zipper pull A device allowing persons with limited function to fasten zippers on clothing, esp. those in back.

zirconium (zĭr-kō′nē-ŭm) SYMB: Zr. A metallic element found only in combination; atomic weight, 91.22; atomic number, 40. It is used in corrosion-resistant alloys and as a white pigment in dental porcelain and other ceramics.

Z line Z disk.

Zn Symbol for the element zinc.

zoacanthosis (zō″ăk-ăn-thō′sĭs) Dermatitis due to foreign bodies such as bristles, hairs, or stingers from animals.

zoanthropy (zō-ăn′thrō-pē) [Gr. *zoon,* animal, + *anthropos,* man] The delusion that one is an animal.

Zocor Simvastatin.

Zollinger-Ellison syndrome (zŏl′ĭn-jĕr-ĕl′ī-sŏn) [Robert M. Zollinger, 1903–1992; Edwin H. Ellison, 1918–1970, U.S. surgeons] A condition caused by neuroendocrine tumors, usually of the pancreas, which secrete excess amounts of gastrin. This stimulates the stomach

to secrete great amounts of hydrochloric acid and pepsin, which in turn leads to peptic ulceration of the stomach and small intestine. About 60% of the tumors are malignant. Hyperacidity produced by the tumor can be treated with proton-pump inhibitors (such as omeprazole). Surgical removal of the tumor (called gastrinoma) may be curative.

Zoloft Sertraline.

zolpidem (zōl′pē-dĕm) An imidazopyridine administered orally as a short-term treatment of insomnia. Its therapeutic class is sedatives/hypnotics.

zona (zō′nă) *pl.* **zonae** [L., a girdle] **1.** A band or girdle. **2.** Herpes zoster.

z. ciliaris Ciliary zone.

z. fasciculata The middle layer of the adrenal cortex. It secretes glucocorticoids, mainly cortisol.

z. glomerulosa The outer layer of the adrenal cortex. It secretes mineralocorticoids, mainly aldosterone.

z. ophthalmica Old name for herpes zoster of the area supplied by the ophthalmic nerve.

z. pellucida The inner, solid, thick, membranous envelope of the ovum. It is pierced by many radiating canals, giving it a striated appearance. SYN: *zona radiata; zona striata; membrane, vitelline*.

z. radiata Zona pellucida.

z. reticularis The inner layer of the adrenal cortex. It secretes very small amounts of androgens and estrogens.

z. striata Zona pellucida.

zonal (zō′năl) [L. *zonalis*] Pert. to a zone.

zonary (zō′năr-ē) [L. *zona,* a girdle] Pert. to or shaped like a zone.

zone (zōn) [L. *zona,* a girdle] An area or belt.

border z. The partially damaged part of an organ that is found between tissue that is severely injured by an infarct and nearby tissue that is still well supplied with blood, oxygen, and nutrients.

cell-free z. In dentistry, an area below the odontoblastic layer of the dental pulp that has relatively few cells; also called the *zone of Weil*.

cell-rich z. The area of increased cell frequency between the cell-free zone and the central pulp of the tooth.

chemoreceptor trigger z. ABBR: CTZ. A zone in the medulla that is sensitive to certain chemical stimuli. Stimulation of this zone may produce nausea.

ciliary z. The peripheral part of the anterior surface of the iris of the eye.

cold z. In a hazardous materials incident, an unexposed area where rescue personnel wait for assignments and the command post is located, which is safe from any potential contamination.

comfort z. The range of temperature, humidity, and, when applicable, solar radiation and wind in which an individual doing work at a specified rate and in a certain specified garment is comfortable.

epileptogenic z. Any area of the brain that after stimulation produces an epileptic seizure.

erogenous z. An area of the body that may produce erotic sensations when stimulated. These areas include, but are not limited to, the breasts, lips, genital and anal regions, buttocks, and sometimes the special senses that cause sexual excitation, such as the sense of smell or taste.

H z. H band.

hot z. In a hazardous materials incident or biohazard laboratory, the area where the hazardous materials are located. This area cannot be entered without protective equipment, special permission, and specialized training.

hypnogenic z. Any area of the body that, when pressed on, induces hypnosis.

lung z. A hypothetical region of the lung defined by the relationship between the degree of alveolar ventilation and pulmonary blood flow (perfusion). Three lung zones have been identified: I, ventilation exceeds perfusion; II, ventilation and perfusion are equal; and III, perfusion exceeds ventilation. Zone I is found in the upper lung field, where gravity impedes perfusion, and zone III in the inferior portion of the lung, where gravity assists perfusion.

transitional z. The area of the lens of the eye where the epithelial capsule cells change into lens fibers.

warm z. In a hazardous materials incident, the area between the hot zone and the cold zone, where decontamination occurs. Only specialized personnel who are appropriately dressed are permitted in this location.

zonesthesia (zōn″ĕs-thē′zē-ă) [″ + *aisthesis,* sensation] A sensation, as a cord constricting the body. SYN: *girdle sensation; girdle pain*.

zonifugal (zō-nĭf′ū-găl) [″ + *fugere,* to flee] Passing outward from within any zone or area.

zoning The occurrence of a stronger fixation of complement in a lesser amount of suspected serum; a phenomenon occasionally observed in diagnosing syphilis by the complement-fixation method.

zonipetal (zō-nĭp′ĕt-ăl) [″ + *petere,* to seek] Passing from outside into a zone or area of the body.

zonography (zō-nŏg′ră-fē) A type of tomography, using a tomographic angle less than 10°, that produces an image of a larger thickness of tissue. This technique is used for kidneys or structures lacking inherent contrast.

zonoskeleton (zōn″ō-skĕl′ĕ-tŏn) The proximal bones to which limbs attach,

such as the hip bone, scapula, and clavicle.

zonula (zōn′ū-lă) [L.] A small zone. SYN: *zonule*.

z. adherens The portion of the junctional complex between columnar epithelial cells below the zonula occludens where there is an intercellular space of about 200 A.U. and the cellular membranes are supported by filamentous material.

z. ciliaris The suspensory ligament of the crystalline lens. SYN: *zonule of Zinn*.

z. occludens The portion of the junctional complex between columnar epithelial cells just below the free surface where the intercellular space is obliterated. Also called *tight junction*.

zonular (zōn′ū-lăr) Pert. to a zonula.

zonular space A space between the fibers of the ligaments of the lens.

zonule (zōn′ūl) [L. *zonula,* small zone] A small band or area. SYN: *zonula*.

z. of Zinn Zonula ciliaris.

zonulitis (zōn-ū-lī′tĭs) [″ + Gr. *itis,* inflammation] Inflammation of the zonule of Zinn.

zonulolysis (zŏn″ū-lŏl′ĭ-sĭs) [″ + Gr. *lysis,* dissolution] The use of enzymes to dissolve the zonula ciliaris of the eye. SYN: *zonulysis*.

zonulotomy (zŏn″ū-lŏt′ō-mē) [″ + Gr. *tome,* incision] Surgical incision of the ciliary zonule.

zonulysis (zŏn″ū-lī′sĭs) Zonulolysis.

zoo- Combining form meaning *animal, animal life.*

zoobiology (zō″ō-bī-ŏl′ō-jē) [Gr. *zoon,* animal, + *bios,* life, + *logos,* word, reason] The biology of animals.

zoochemistry (zō″ō-kĕm′ĭs-trē) Biochemistry of animals.

zoofulvin (zō″ō-fŭl′vĭn) A yellow pigment derived from certain animal feathers.

zoogenous (zō-ŏj′ĕn-ŭs) [″ + *gennan,* to produce] Derived or acquired from animals.

zoogeny (zō″ŏj′ĕ-nē) [″ + *gennan,* to produce] The development and evolution of animals.

zoogeography (zō″ō-jē-ŏg′ră-fē) The study of the distribution of animals on the earth.

zooglea (zō″ō-glē′ă) [″ + *gloios,* sticky] A stage in development of certain organisms in which colonies of microbes are embedded in a gelatinous matrix.

zoograft (zō′ō-grăft) [″ + L. *graphium,* stylus] A graft of tissue obtained from an animal.

zoografting (zō″ō-grăft′ĭng) The use of animal tissue in grafting on a human body.

zooid (zō′oyd) [″ + *eidos,* form, shape] **1.** Resembling an animal. **2.** A form resembling an animal; an organism produced by fission. **3.** An animal cell that can move or exist independently.

zoolagnia (zō″ō-lăg′nē-ă) [″ + *lagneia,* lust] Sexual desire for animals.

zoologist (zō-ŏl′ō-jĭst) [″ + *logos,* word, reason] A biologist who specializes in the study of animal life.

zoology (zō-ŏl′ō-jē) The science of animal life.

zoomania (zō″ō-mā′nē-ă) [Gr. *zoon,* animal, + *mania,* madness] A morbid and excessive affection for animals.

Zoomastigophora (zō″ŏ-măs″tĭ-gō′fō-ră) A class of unicellular organisms within the phylum Sarcomastigophora. These organisms usually have one or more flagella, but these may be absent in some species. It includes free-living and parasitic species such as *Giardia lamblia*.

zoonosis (zō-ō-nō′sĭs) *pl.* **zoonoses** [″ + *nosos,* disease] An infection common in animal populations that occasionally infects humans. Over 250 organisms are known to cause zoonotic infections, of which 30 to 40 spread from pets and animals used by the blind and deaf. Immunosuppressed persons and persons who work with animals are esp. at risk of developing zoonoses.

zoonotic (zō″ō-nŏt′ĭk) Concerning zoonoses.

Zoon's vulvitis Plasmacellularis vulvitis.

zooparasite (zō″ō-păr′ă-sīt) [″ + *para,* beside, + *sitos,* food] An animal parasite.

zoopathology (zō″ō-păth-ŏl′ō-jē) [″ + *pathos,* disease, + *logos,* word, reason] The science of the diseases of animals.

zoophile (zō′ō-fīl) [″ + *philein,* to love] **1.** One who likes animals. **2.** An antivivisectionist.

zoophilia (zō″ō-fĭl′ē-ă) The preference for obtaining sexual gratification by having intercourse or other sexual activity with animals.

zoophilism (zō-ŏf′ĭl-ĭzm) [″ + ″ + *-ismos,* condition] An abnormal love of animals.

zoophyte (zō′ō-fīt) [″ + *phyton,* plant] An animal that appears plantlike; any of numerous invertebrate animals resembling plants in appearance or mode of growth.

zooplankton (zō″ō-plănk′tŏn) [″ + *planktos,* wandering] A small animal organism present in natural waters. SEE: *phytoplankton*.

zoopsychology (zō″ō-sī-kŏl′ō-jē) Animal psychology.

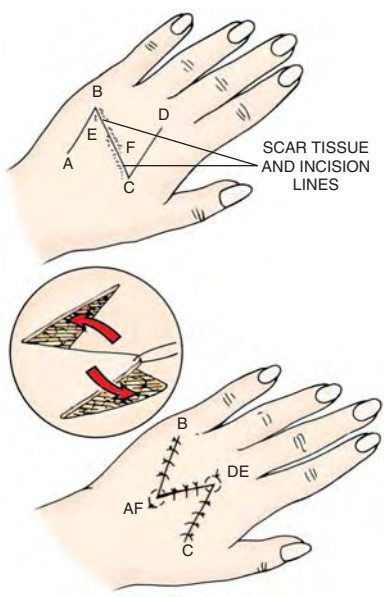
zoosadism (zō″ō-sā′dĭzm) The act of being sadistic to animals.

zooscopy (zō-ŏs′kō-pē) [″ + *skopein,* to examine] **1.** Zoopsia. **2.** The scientific observation of animals.

zoosmosis (zō″ŏs-mō′sĭs) [Gr. *zoe,* life, + *osmos,* impulsion] Osmosis that occurs within cells.

zoospore (zō′ō-spor) [″ + *sporos,* seed] A motile asexual spore that moves by means of one or more flagella.

zoosterol (zō″ō-stē′rŏl) Any sterol derived from animals.
zootechnics (zō″ō-tĕk′nĭks) [Gr. *zoon,* animal, + *techne,* art] The complete care, management, and breeding of domestic animals.
zootic (zō-ŏt′ĭk) Concerning animals.
zootomy (zō-ŏt′ō-mē) [″ + *tome,* incision] Dissection of animals.
zootoxin (zō″ō-tŏks′ĭn) [″ + *toxikon,* poison] Any toxin or poison produced by an animal (e.g., snake venom).
zootrophic (zō″ō-trŏf′ĭk) [″ + *trophe,* nutrition] Concerning animal nutrition.
zoster (zŏs′tĕr) [Gr. *zoster,* girdle] Herpes zoster.
z. auricularis Herpes zoster of the ear.
z. ophthalmicus Herpes zoster affecting the ophthalmic nerve.
z. sine herpete Cutaneous pain of dermatomal distribution, suggestive of herpes zoster but without the typical rash of shingles. That the pain is caused by a reactivation of herpes zoster may be confirmed by antibody titer or polymerase chain reaction tests.
zosteroid (zŏs′tĕr-oyd) [″ + *eidos,* form, shape] Resembling herpes zoster.
ZPG *zero population growth.*
Z-plasty (z-plăs′tē) The use of a Z-shaped incision in plastic surgery to relieve tension in scar tissue. The area under tension is lengthened at the expense of the surrounding elastic tissue. SEE: illus.; *tissue expansion, soft; W-plasty*.



Z-PLASTY METHOD OF CORRECTING A DEFORMING SCAR

Zr Symbol for the element zirconium.
Z-track (z-trăk′) An injection technique in which the surface (skin and subcutaneous) tissues are pulled and held to one side before insertion of the needle deep into the muscle in the identified site. The medication is injected slowly, followed by a 10-sec delay; then the needle is removed, and the tissues are quickly permitted to resume their normal position. This provides a Z-shaped track, which makes it difficult for the injected irritating drug to seep back into subcutaneous tissues.
-zumab (zoo′măb) A combining form for *humanized monoclonal antibody*. Compared with monoclonal antibodies made from chimeric sources (-ximabs), -zumabs are less likely to elicit a neutralizing antibody response in the patient who receives them.
zwitterion (tsvĭt′ĕr-ī″ŏn) A dipolar ion that contains positive and negative charges of equal strength. This ion is therefore not attracted to either an anode or cathode. In a neutral solution, amino acids function as zwitterions.
zygal (zī′găl) [Gr. *zygon,* yoke] Concerning or shaped like a yoke.
zygapophyseal (zī″gă-pō-fīz′ē-ăl) Concerning a zygapophysis.
zygapophysis (zī″gă-pŏf′ĭ-sĭs) [″ + *apo,* from, + *physis,* growth] One of the articular processes of the neural arch of a vertebra.
zygion (zĭj′ē-ŏn) *pl.* **zygia** [Gr. *zygon,* yoke] The craniometrical point on the zygoma at either end of the bizygomatic diameter.
zygodactyly (zī″gō-dăk′tĭl-ē) [″ + *daktylos,* digit] Syndactylism.
zygoma (zī-gō′mă) [Gr., cheekbone] **1.** The long arch that joins the zygomatic processes of the temporal and malar bones on the sides of the skull. **2.** The malar bone.
zygomatic (zī″gō-măt′ĭk) Pert. to the zygomatic bone, also called the cheekbone or malar bone.
zygomatic arch The formation, on each side of the cheeks, of the zygomatic process of each malar bone articulating with the zygomatic process of the temporal bone.
zygomaticoauricularis (zī″gō-măt″ĭ-kō-ăw-rĭk″ū-lā′rĭs) [L.] The muscle that draws the pinna of the ear forward.
zygomaticofacial (zī″gō-măt″ĭ-kō-fā′shăl) Concerning the zygomatic bone and face.
zygomaticofrontal (zī″gō-măt″ĭ-kō-frŏn′tăl) Concerning the zygomatic bone and frontal bone of the face.
zygomaticomaxillary (zī″gō-măt″ĭ-kō-măk′sĭ-lĕr″ē) Concerning the zygomatic bone and maxilla.
zygomatico-orbital (zī″gō-măt″ĭ-kō-or′bĭ-tăl) Concerning the zygomatic bone and orbit of the eye.
zygomaticosphenoid (zī″gō-măt″ĭ-kō-

sfē′noyd) Concerning the zygomatic bone and sphenoid bone.

zygomaticotemporal (zī″gō-măt″ĭ-kō-tĕm′por-ăl) Concerning the zygomatic bone and temporal bone.

zygomaticum (zī″gō-măt′ĭ-kŭm) [L.] Zygomatic bone.

zygomaticus (zī″gō-măt′ĭk-ŭs) [L.] A muscle that draws the upper lip upward and outward.

zygomaxillary (zī″gō-măks′ĭl-ār-ē) [Gr. *zygoma,* cheekbone, + L. *maxilla,* jawbone] Pert. to the cheekbone and upper jaw.

Zygomycetes (zī″gō-mī-sēt′ēz) In one system of taxonomy, a class of the true fungi that includes those which cause mucormycosis and entomophthoramycosis. This class is equivalent to the phylum Zygomycotina in another system of taxonomy.

zygomycosis (zī″gō-mī-kō′sĭs) Fungal infections caused by various species including those involved in mucormycosis and entomophthoramycosis.

Zygomycotina (zī″gō-mī″kō-tēn′ă) [NL.] In one system of taxonomy, a phylum of the true fungi. It is synonymous with the class Zygomycetes in another system of taxonomy.

zygon (zī′gŏn) [Gr.] The short crossbar connecting the parallel limbs of a cerebral fissure.

zygopodium (zī″gō-pō′dē-ŭm) The intermediate-distal portion of a limb, such as the ulna and radius, and the tibia and fibula.

zygosis (zī-gō′sĭs) [Gr. *zygosis,* a balancing] The sexual union of two unicellular animals.

zygosity (zī-gŏs′ĭ-tē) [Gr. *zygon,* yoke] Concerning zygosis.

zygosperm (zī′gō-spĕrm) Zygospore.

zygospore (zī′gō-spor) A spore formed by fusion of morphologically identical structures. SYN: *zygosperm*.

zygote (zī′gōt) [Gr. *zygotos,* yoked] The cell produced by the union of two gametes; the fertilized ovum. SYN: *oosperm; zygocyte*.

zygote intrafallopian transfer SEE: under *transfer*.

zygotene (zī′gō-tēn) [Gr. *zygotos,* yoked] The second stage of the prophase of the first meiotic division. During this stage, the homologous chromosomes pair side by side. SEE: *cell division*.

zygotic (zī-gŏt′ĭk) Concerning a zygote.

zygotoblast (zī-gō′tō-blăst) [″ + *blastos,* germ] Sporozoite.

zygotomere (zī-gō′tō-mēr) [″ + *meros,* part] Sporoblast.

zymase (zī′mās) [Gr. *zyme,* leaven, + *-ase,* enzyme] Any of a group of enzymes that, in the presence of oxygen, convert certain carbohydrates into carbon dioxide and water or, in the absence of oxygen, into alcohol and carbon dioxide or lactic acid. It is found in yeast, bacteria, and higher plants and animals. SEE: *enzyme, fermenting*.

zymic (zī′mĭk) Concerning enzymes.

zymogen (zī′mō-jĕn) [″ + *gennan,* to produce] A protein that becomes an enzyme. It exists in an inactive form antecedent to the active enzyme. **zymogenic,** *adj.* SYN: *proenzyme*. SEE: *pepsinogen; trypsinogen*.

zymogenous (zī-mŏj′ĕ-nŭs) Zymogenic.

zymogram (zī′mō-grăm) An electrophoretic graph of the separation of the enzymes in a solution.

zymohexase (zī″mō-hĕk′sās) The enzyme involved in splitting fructose 1,6-diphosphate into dihydroxyacetone phosphate and phosphoglyceric aldehyde.

zymologist (zī-mŏl′ō-jĭst) One who specializes in the study of enzymes.

zymology (zī-mŏl′ō-jē) The science of fermentation.

zymolysis (zī-mŏl′ĭ-sĭs) [Gr. *zyme,* leaven, + *lysis,* dissolution] The changes produced by an enzyme; the action of enzymes.

zymolyte (zī′mō-līt″) Substrate.

zymolytic (zī″mō-lĭt′ĭk) [″ + *lytikos,* dissolved] Causing a reaction catalyzed by an enzyme.

zymoprotein (zī″mō-prō′tē-ĭn) Any protein that also functions as an enzyme.

zymosan (zī′mō-săn) An anticomplement obtained from the walls of yeast cells.

zymose (zī′mōs) Invertase.

zymosterol (zī-mŏs′tĕr-ŏl) A sterol obtained from yeast.

zymotic (zī-mŏt′ĭk) Rel. to or produced by fermentation.

Zyrtec Cetirizine.

Z.Z.′Z.″ Symbol for increasing strengths of contraction.

APPENDIX 1
Nutrition

Appendix 1-1 Explanation of Dietary Reference Values

AI, Adequate Intake The amount of a specific nutrient needed to achieve a specific indication (e.g., to maintain bone mass).

DRI, Dietary Reference Intake A nutrient recommendation index based on the parameters specified in the Average Intake, Estimated Average Requirement, Recommended Dietary Allowance, and Upper Intake values.

DRV, Daily Reference Value Standards for nutrient intake set for both macronutrient and micronutrient dietary components that lack a Recommended Dietary Allowance. The Daily Reference Value for some nutrients represents their Upper Limit.

DV, Daily Value A dietary reference term that encompasses the Dietary Reference Value and Reference Daily Intake. It is used to calculate the labeled percent of each nutrient that a serving of the product provides.

EAR, Estimated Average Requirement The estimated intake of a nutrient that meets the nutritional needs of 50% of the individuals within a given age-gender cohort.

ESADDI, Estimated Safe and Adequate Daily Intake The amount of a nutrient calculated to meet the needs of half of the individuals in that age group.

RDA, Recommended Dietary Allowance The amount of a specific dietary component, as established by the National Academy of Sciences, required to meet the needs of 97% of the individuals in a given age-gender cohort. $RDA = EAR + 2SD_{EAR}$

RDI, Reference Daily Intake The nutrient intake standard established by the U.S. Food and Drug Administration as a food label reference for macronutrients and micronutrients.

RNI, Recommended Nutrient Intake The Canadian nutrient intake standard.

US RDA, U.S. Recommended Daily Allowance A nutritional standard formerly promulgated by the FDA and now replaced by the Recommended Dietary Allowance.

UL, Tolerable Upper Intake Level The highest intake per day that is likely to produce no adverse health risks.

	2nd 6 months				71		1200	19	90	120	9	12	290	70

[a] The allowances, expressed as average daily intakes over time, are intended to provide for individual variations among most normal persons living in the United States under usual environmental stresses. Diets should be based on a variety of common foods in order to provide other nutrients for which human requirements have been less well defined.

[b] Weights and heights of reference adults are actual medians for the U.S. population of the designated age, as reported by NHANES II [second National Health and Nutrition Examination Survey]. The median weights and heights of those under 19 years of age were taken from Hamill et al. [Physical Growth: National Center for Health Statistics percentiles. Am J Clin Nutr 32:607, 1979]. The use of these figures does not imply that the height-to-weight ratios are ideal.

[c] Retinol equivalents. 1 RE = 1 μg retinol or 6 μg beta-carotene.

[d] Alpha-tocopherol equivalents. 1 mg d-alpha tocopherol = 1 alpha- TE.

[a] As cholecalciferol. 1 μg cholecalciferol = 40 IU vitamin D.

[b] In the absence of adequate exposure to sunlight.

[c] As niacin equivalents (NE). 1 mg of niacin = 60 mg of tryptophan; 0–6 months = preformed niacin (not NE).

[d] As dietary folate equivalents (DFE). 1 DFE = 1 μg food folate = 0.6 μg of folic acid from fortified food or as a supplement consumed with food = 0.5 μg of a supplement taken on an empty stomach.

[e] Although AIs have been set for choline, there are few data to assess whether a dietary supply of choline is needed at all stages of the life cycle, and it may be that the choline requirement can be met by endogenous synthesis at some of these stages.

[f] Because 10 to 30% of older people may malabsorb food-bound B_{12}, it is advisable for those older than 50 years to meet their RDA mainly by consuming foods fortified with B_{12} or a supplement containing B_{12}.

[g] In view of evidence linking folate intake with neural tube defects in the fetus, it is recommended that all women capable of becoming pregnant consume 400 μg from supplements or fortified foods in addition to intake of food folate from a varied diet.

[h] It is assumed that women will continue consuming 400 μg from supplements or fortified food until their pregnancy is confirmed and they enter prenatal care, which ordinarily occurs after the end of the periconceptional period—the critical time for formation of the neural tube.

This table presents Recommended Dietary Allowances (RDAs) in bold type and Adequate Intakes (AIs) in ordinary type followed by an asterisk (*). RDAs and AIs may both be used as goals for individual intake. RDAs are set to meet the needs of almost all (97 to 98%) individuals in a group. For healthy breastfed infants, the AI is the mean intake. The AI for other life-stage and gender groups is believed to cover needs of all individuals in the group.

Pregnancy									
≤18 years	2.5	3.5	350	50	10	30	80	800	3.0
19–50 years	2.5	3.5	350	50	10	35	100	1,000	3.5
Lactation									
≤ 18 years	2.5	4	350	50	10	30	80	800	3.0
19–50 years	2.5	4	350	50	10	35	100	1,000	3.5

[a] UL = The maximum level of daily nutrient intake that is likely to pose no risk of adverse effects. Unless otherwise specified, the UL represents total intake from food, water, and supplements. Due to lack of suitable data, ULs could not be established for thiamine, riboflavin, vitamin B_{12}, pantothenic acid, and biotin. In the absence of ULs, extra caution may be warranted in consuming levels above recommended intakes.

[b] The UL for magnesium represents intake from a pharmacological agent only and does not include intake from food and water.

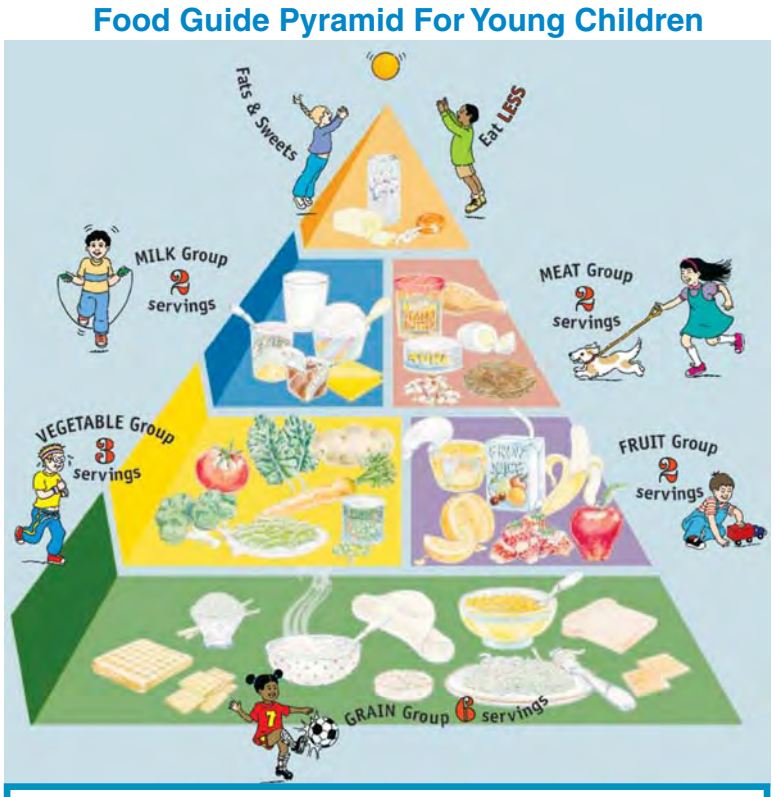
[c] The ULs for niacin and folate apply to synthetic forms obtained from supplements, fortified foods, or a combination of the two.

[d] ND: Not determinable due to lack of data of adverse effects in this age group and concern with regard to lack of ability to handle excess amounts. Source of intake should be from food only to prevent high levels of intake.

SOURCE: National Academy of Sciences

Appendix 1–5 Food Guide Pyramids

Food Guide Pyramid For Young Children



WHAT COUNTS AS ONE SERVING?

GRAIN GROUP
1 slice of bread
1/2 cup of cooked rice or pasta
1/2 cup of cooked cereal
1 ounce of ready-to-eat cereal

VEGETABLE GROUP
1/2 cup of chopped raw or cooked vegetables
1 cup of raw leafy vegetables

FRUIT GROUP
1 piece of fruit or melon wedge
3/4 cup of juice
1/2 cup of canned fruit
1/4 cup of dried fruit

MILK GROUP
1 cup of milk or yogurt
2 ounces of cheese

MEAT GROUP
2 to 3 ounces of cooked lean meat, poultry, or fish.

1/2 cup of cooked dry beans, or 1 egg counts as 1 ounce of lean meat. Two tablespoons of peanut butter count as 1 ounce of meat.

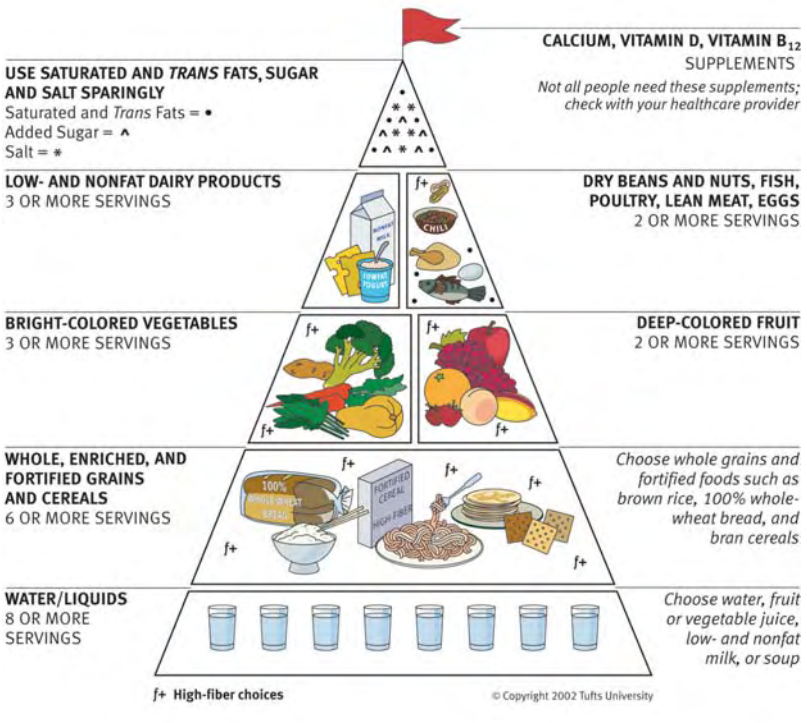
FATS AND SWEETS
Limit calories from these.

Four- to 6-year olds can eat these serving sizes. Offer 2- to 3-year olds less, except for milk. Two- to 6-year old children need a total of 2 servings from the milk group each day.

FOOD IS FUN and learning about food is fun, too. Eating foods from the Food Guide Pyramid and being physically active will help you grow healthy and strong.

SOURCE: U.S. Department of Agriculture Center for Nutrition Policy and Promotion.

Food Guide Pyramid for Older Adults



For additional copies go to http://nutrition.tufts.edu

Modified Food Pyramid for 70+ Adults: Translating Guidelines into Daily Eating

Food Group	*What's a Senior to Do Every Day*	*Best Choices (each equals one serving)*
Bread, fortified cereal, rice, and pasta	Strive for 6 servings of high-fiber, unrefined whole grains.	1 slice whole-grain bread; ½ cup cooked brown rice; 1 oz fortified cereal
Vegetables	Munch on 3 servings of bright-colored vegetables each day—look for dark green, red, orange, and yellow (best sources of valuable nutrients).	1 cup raw spinach; ½ cup mashed squash; ¾ cup 100% vegetable juice. NOTE: If you boil vegetables, use the cooking water (many vitamins and minerals are in it) in sauces, soups, or stews.
Fruits	Snack on 2 servings of brightly colored fruits	1 med. orange, banana, apple; ½ cup berries; ¼ cup raisins or prunes; ¾ cup 100% juice—select juice with calcium
Milk, yogurt, and cheese	Eat 2–3 servings of low-fat or non-fat dairy foods. These are great sources of calcium and vitamin D.	1 cup low-fat milk or yogurt; 1½ oz low-fat natural cheese. NOTE: If you have trouble digesting milk products, try lactose-free dairy products, or add lactose enzymes to milk.
Meat, poultry, fish, dried beans (legumes), eggs, and nuts	Eat 2 servings of these high-protein foods. Fish is great—its omega-3 fatty acids have many health benefits. Beans provide fiber and nutrients as well as protein, and are less expensive than meat.	½ cup cooked lentils or other legumes (dried or canned); 1 egg or 2 egg whites; 2–3 oz fish, lean meat, or skinless poultry
Fats, oils, and sweets	Choose these foods sparingly. Use oils, tub margarine, and butter instead of solids (shortening, stick butter, and margarine.	1 teaspoon oil: olive, canola, peanut, safflower, sunflower, corn, cottonseed, or flaxseed

Pay Special Attention to:
Fluid. Drink 8 eight-ounce glasses per day whether you feel thirsty or not. Don't count alcohol or caffeine-containing fluids in the 8 glasses per day.
Fiber. Dietary fiber may help to relieve constipation.
Supplements. It's tough for people over 70 to get enough calcium, vitamin B_{12}, and vitamin D in their diets. Take supplements of these three nutrients regularly.

Appendix 1–6 Vitamins*

Vitamin	*Chief Functions*	*Results of Deficiency or Overdose*	*Characteristics*	*Good Sources*
VITAMIN A Retinol (animal sources) Carotene Beta-carotene (plant sources)	Maintains epithelial membranes; functions in infection resistance; needed to form rhodopsin; prevents night blindness; ensures proper bone growth; facilitates RNA transcription.	*Deficiency:* Increased susceptibility to infection; abnormal function of gastrointestinal, genitourinary, and respiratory tracts; skin dries, shrivels, thickens; sometimes pustule formation; xerophthalmia, a characteristic eye disease. *Overdose:* Bleeding disorders; bone decalcification; immune system stimulation; fatigue; nausea; diarrhea; dry skin; brittle nails; jaundice.	Fat soluble; stable during cooking; destroyed by heat and oxygen together; marked capacity for storage in the liver.	Liver; dark green leafy vegetables, esp. escarole, kale, and parsley; yellow-orange fruits and vegetables, esp. carrots, apricots, and cantaloupe; butter or fortified margarine; milk and dairy products; meats, fish, and poultry.
VITAMIN B_1 Thiamine	Involved in carbohydrate metabolism; essential for normal nervous tissue function; acts as a coenzyme for cellular energy production.	*Deficiency:* Weakness; wasting; mental confusion; peripheral paralysis; edema; beriberi.	Water soluble; stable during most cooking; destroyed by alkali or sulfites; not stored in the body. Note: Deficiency often accompanies alcoholism.	Brewer's yeast; pork; soy milk; liver; milk; enriched or whole-grain cereals; beans; nuts.
VITAMIN B_2 Riboflavin	Acts as a coenzyme in cellular oxidation; essential to normal growth; participates in light adaptation; vital to protein metabolism; associated with functions of niacin and vitamin B_6.	*Deficiency:* Cheilosis; glossitis; dermatitis around mouth and nose; corneal reddening; light hypersensitivity.	Water soluble; alcohol soluble; stable during most cooking; destroyed by alkali; unstable in light.	Milk and dairy products; collard greens; broccoli; whole-grain or enriched breads and cereals; liver; meat, fish, and poultry; eggs; legumes.
VITAMIN B_6 Pyridoxine Pyridoxal Pyridoxamine	Used in hemoglobin synthesis; essential for metabolism of tryptophan to niacin; needed for utilization of other amino acids.	*Deficiency:* Anemias; depressed immunity; dermatitis around mouth and nose; neuritis; anorexia; nausea; vomiting.	Water soluble; alcohol soluble; inactivated by heat, sunlight, or air.	Meats; liver; cereal grains; bananas; nuts.

*See App. 1-2 for recommended daily allowances.

VITAMIN B_{12} Cyanocobalamin Hydroxycobalamin	Needed for myelin synthesis; essential for proper red blood cell development; associated with folate metabolism.	*Deficiency:* Pernicious anemia; neurological disorders.	Water soluble; alcohol soluble; unstable in hot alkaline or acid solutions.	Synthesized by gastrointestinal flora; meat; yeast; milk; eggs.
VITAMIN C Ascorbic acid	Acts as an antioxidant; essential to formation of the protein collagen; facilitates iron absorption; facilitates cholesterol conversion to bile acids; essential to serotonin synthesis.	*Deficiency:* Joint tenderness; lowered resistance to infections; susceptibility to dental caries, pyorrhea, and bleeding gums; delayed wound healing; bruising; anemia; hemorrhaging; scurvy. *Overdose:* Nausea; diarrhea; hemolytic anemia; gout; kidney stones.	Water soluble; destroyed by light; heat hastens the process; lost in cooking when water is discarded; cooking loss is increased in iron or copper utensils.Stored in the body to a limited extent.	Citrus fruit; strawberries; green peppers; mustard greens; cauliflower.
VITAMIN D Calciferol Ergocalciferol Cholecalciferol Calcitriol Antirachitic factor	Promotes gastrointestinal absorption of calcium and phosphorus; promotes bone and tooth mineralization; promotes renal calcium absorption; antirachitic.	*Deficiency:* Interferes with utilization of calcium and phosphorus in bone and tooth formation; irritability; weakness; rickets in young children; osteomalacia in adults. *Overdose:* Irritability; kidney stone formation; calcification of soft tissues.	Fat soluble; soluble in organic solvents; relatively stable when refrigerated; stored in liver; often associated with vitamin A.	Formed in the skin by sunlight exposure; fortified milk and dairy products; egg yolks; liver; fatty fish, esp. salmon, tuna, herring, and sardines; oysters.
VITAMIN E Alpha-tocopherol Beta-tocopherol Gamma-tocopherol	Prevents oxidative damage of lipids and cell membranes; promotes red blood cell stability.	*Deficiency:* Immune system suppression; red blood cell hemolysis.	Fat soluble; destroyed by heat; destroyed by oxidation.	Vegetable oils, esp. soybean and corn; wheat germ.

Vitamins (Continued)

Vitamin	*Chief Functions*	*Results of Deficiency or Overdose*	*Characteristics*	*Good Sources*
FOLATE Folacin Folic acid	Needed for normal hematopoiesis; important coenzyme for nucleic acid synthesis; facilitates fetal development for neural tube closure; functions interrelated with those of vitamin B_{12}.	*Deficiency:* Neural tube defects including spina bifida and anencephalus are associated with maternal deficiency; alcohol interferes with absorption; diarrhea; glossitis; macrocytic anemia. *Overdose:* Masking of vitamin$_{12}$ deficiency, which may lead to nerve damage.	Slightly water soluble; destroyed by heat at low pH; loss in food stored at room temperature.	Liver; green leafy vegetables; legumes; beets; broccoli; cauliflower; citrus fruits; sweet potatoes.
VITAMIN K Phylloquinone (plant form) Menaquinone (bacterial form)	Regulates blood coagulation; regulates blood Ca^{++} levels.	*Deficiency:* Hemorrhagic disease; fat malabsorption can cause deficiency. *Overdose:* Kernicterus.	Fat soluble; stable to heat.	Produced by gastrointestinal flora; green leafy vegetables esp. broccoli; cauliflower; liver.
NIACIN Nicotinic acid Nicotinamide	Facilitates glycolysis, tissue respiration, fat synthesis, and cellular energy production.	*Deficiency:* Dermatitis; edema; diarrhea; irritability; mental confusion. *Overdose:* Flushed skin; intestinal irritation; liver damage.	Soluble in hot water and alcohol; stable during cooking; not destroyed by light, air, or alkali.	Milk; eggs; meat; legumes; whole-grain or enriched breads and cereals. Also formed in the body from dietary tryptophan (amino acid).

Appendix 1–7 FDA-Approved Dietary Health Claims

Health Claim	*Requirements*	*Sample Claim*
Calcium and osteoporosis Low calcium intake is one risk factor for osteoporosis. Lifelong adequate calcium intake helps maintain bone health by increasing, as much as genetically possible, the amount of bone formed in the teens and early adult life and by helping to slow the rate of bone loss that occurs later in life.	Food or supplement must be "high" in calcium and must not contain more phosphorus than calcium. Claims must cite other risk factors; state the need for regular exercise and a healthful diet; explain that adequate calcium early in life helps reduce fracture risk later by increasing, as much as genetically possible, a person's peak bone mass; and must indicate that those at greatest risk of developing osteoporosis later in life are white and Asian teenage and young adult women who are in their bone-forming years. Claims for products with more than 400 mg of calcium per day must state that a daily intake over 2,000 mg offers no added known benefit to bone health.	*Regular exercise and a healthy diet with enough calcium help teen and young adult white and Asian women maintain good bone health and may reduce their high risk of osteoporosis later in life.*
Dietary fat and cancer Diets high in fat increase the risk of some types of cancer, such as cancers of the breast, colon, and prostate. Although scientists don't know how total fat intake affects cancer development, low-fat diets reduce the risk. Experts recommend that Americans consume 30% or less of daily calories as fat. Typical U.S. intakes are 37%.	Foods must meet criteria for "low fat." Fish and game meats must meet criteria for "extra lean." Claims may not mention specific types of fats and must use "total fat" or "fat" and "some types of cancer" or "some cancers" in discussing the nutrient-disease link.	*Development of cancer depends on many factors. A diet low in total fat may reduce the risk of some cancers.*

FDA-Approved Dietary Health Claims (Continued)

Health Claim	*Requirements*	*Sample Claim*
Dietary saturated fat and cholesterol and risk of coronary heart disease Diets high in saturated fat and cholesterol increase total and low-density (bad) blood cholesterol levels and, thus, the risk of coronary heart disease. Diets low in saturated fat and cholesterol decrease the risk. Guidelines recommend that American diets contain less than 10% of calories from saturated fat and less than 300 mg cholesterol daily. The average American adult diet has 13% saturated fat and 300 to 400 mg cholesterol a day.	Foods must meet criteria for "low saturated fat," "low cholesterol," and "low fat." Fish and game meats must meet criteria for "extra lean." Claims must use "saturated fat and cholesterol" and "coronary heart disease" or "heart disease" in discussing the nutrient-disease link.	*Although many factors affect heart disease, diets low in saturated fat and cholesterol may reduce the risk of this disease.*
Dietary soluble fiber, such as that found in whole oats and psyllium seed husk, and coronary heart disease When included in a diet low in saturated fat and cholesterol, soluble fiber may affect blood lipid levels, such as cholesterol, and thus lower the risk of heart disease. However, because soluble dietary fibers constitute a family of very heterogeneous substances that vary greatly in their effect on the risk of heart disease, FDA has determined that sources of soluble fiber for this health claim need to be considered case-by-case. To date, FDA has reviewed and authorized two sources of soluble fiber eligible for this claim: whole oats and psyllium seed husk.	Foods must meet criteria for "low saturated fat," "low cholesterol," and "low fat." Foods that contain whole oats must contain at least 0.75 g of soluble fiber per serving. Foods that contain psyllium seed husk must contain at least 1.7 g of soluble fiber per serving. The claim must specify the daily dietary intake of the soluble fiber source necessary to reduce the risk of heart disease and the contribution one serving of the product makes toward that intake level. Soluble fiber content must be stated in the nutrition label. Claims must use "soluble fiber" qualified by the name of the eligible source of soluble fiber and "heart disease" or "coronary heart disease" in discussing the nutrient-disease link. Because of the potential hazard of choking, foods containing dry or incompletely hydrated psyllium seed husk must carry a label statement telling consumers to drink adequate amounts of fluid, unless the manufacturer shows that a viscous adhesive mass is not formed when the food is exposed to fluid.	*Diets low in saturated fat and cholesterol that include 3 g of soluble fiber from whole oats per day may reduce the risk of heart disease. One serving of this whole-oats product provides [number] grams of this soluble fiber.*

Fiber-containing grain products, fruits, and vegetables and cancer Diets low in fat and rich in fiber-containing grain products, fruits, and vegetables may reduce the risk of some types of cancer. The exact role of total dietary fiber, fiber components, and other nutrients and substances in these foods is not fully understood.	Foods must meet criteria for "low fat" and, without fortification, be a "good source" of dietary fiber. Claims must not specify types of fiber and must use "fiber," "dietary fiber," or "total dietary fiber" and "some types of cancer" or "some cancers" in discussing the nutrient-disease link.	*Low-fat diets rich in fiber-containing grain products, fruits, and vegetables may reduce the risk of some types of cancer, a disease associated with many factors.*
Fruits, vegetables, and grain products that contain fiber, particularly soluble fiber, and risk of coronary heart disease Diets low in saturated fat and cholesterol and rich in fruits, vegetables, and grain products that contain fiber, particularly soluble fiber, may reduce the risk of coronary heart disease. (It is impossible to adequately distinguish the effects of fiber, including soluble fiber, from those of other food components.)	Foods must meet criteria for "low saturated fat," "low fat," and "low cholesterol." They must contain, without fortification, at least 0.6 g of soluble fiber per reference amount, and the soluble fiber content must be listed. Claims must use "fiber," "dietary fiber," "some types of dietary fiber," "some dietary fibers," or "some fibers" and "coronary heart disease" or "heart disease" in discussing the nutrient-disease link. The term "soluble fiber" may be added.	*Diets low in saturated fat and cholesterol and rich in fruits, vegetables, and grain products that contain some types of dietary fiber, particularly soluble fiber, may reduce the risk of heart disease, a disease associated with many factors.*
Folate and neural tube birth defects Defects of the neural tube occur within the first six weeks after conception, often before the pregnancy is known. The U.S. Public Health Service recommends that all women of childbearing age in the United States consume 0.4 mg (400 μg) of folic acid daily to reduce their risk of having a baby affected with spina bifida or other neural tube defects.	Foods must meet or exceed criteria for "good source" of folate—that is, at least 40 μg of folic acid per serving (at least 10% of the Daily Value). A serving of food cannot contain more than 100% of the Daily Value for vitamin A and vitamin D because of their potential risk to fetuses. Claims must use "folate," "folic acid," or "folacin" and "neural tube defects," "birth defects such as spina bifida or anencephaly," "birth defects of the brain or spinal cord, anencephaly, or spina bifida," "spina bifida and anencephaly, birth defects of the brain or spinal cord," "birth defects of the brain and spinal cord," or "brain or spinal cord birth defects" in discussing the nutrient-disease link. Folic acid content must be listed on the Nutrition Facts panel.	*Healthful diets with adequate folate may reduce a woman's risk of having a child with a brain or spinal cord birth defect.*

FDA-Approved Dietary Health Claims (Continued)

Health Claim	*Requirements*	*Sample Claim*
Fruits and vegetables and cancer Diets low in fat and rich in fruits and vegetables may reduce the risk of some cancers. Fruits and vegetables are low-fat foods and may contain fiber or vitamin A (as beta-carotene) and vitamin C. (The effects of these vitamins cannot be adequately distinguished from those of other fruit or vegetable components.)	Foods must meet criteria for "low fat" and, without fortification, be a "good source" of fiber, vitamin A, or vitamin C. Claims must characterize fruits and vegetables as foods that are low in fat and may contain dietary fiber, vitamin A, or vitamin C; characterize the food itself as a "good source" of one or more of these nutrients, which must be listed; refrain from specifying types of fatty acids; and use "total fat" or "fat," "some types of cancer" or "some cancers," and "fiber," "dietary fiber," or "total dietary fiber" in discussing the nutrient-disease link.	*Low-fat diets rich in fruits and vegetables (foods that are low in fat and may contain dietary fiber, vitamin A, or vitamin C) may reduce the risk of some types of cancer, a disease associated with many factors. Broccoli is high in vitamins A and C, and it is a good source of dietary fiber.*
Sodium and hypertension (high blood pressure) Hypertension is a risk factor for coronary heart disease and stroke deaths. The most common source of sodium is table salt. Diets low in sodium may help lower blood pressure and related risks in many people. Guidelines recommend daily sodium intakes of not more than 2,400 mg. Typical U.S. intakes are 3,000 to 6,000 mg.	Foods must meet criteria for "low sodium." Claims must use "sodium" and "high blood pressure" in discussing the nutrient-disease link.	*Diets low in sodium may reduce the risk of high blood pressure, a disease associated with many factors.*
Dietary sugar alcohol and dental caries (cavities) Eating foods high in sugar and starches between meals may promote tooth decay. Sugarless candies made with certain sugar alcohols do not.	Foods must meet the criteria for "sugar free." The sugar alcohol must be xylitol, sorbitol, mannitol, maltitol, isomalt, lactitol, hydrogenated starch hydrolysates, hydrogenated glucose syrups, erythritol, or a combination of these. When the food contains a fermentable carbohydrate, such as sugar or flour, the food must not lower plaque pH in the mouth below 5.7 while it is being eaten or up to 30 minutes afterwards. Claims must use "sugar alcohol," "sugar alcohols," or the name(s) of the sugar alcohol present and "dental caries" or "tooth decay" in discussing the nutrient-disease link. Claims must state that the sugar alcohol present "does not promote," "may reduce the risk of," "is useful in not promoting," or "is expressly for not promoting" dental caries.	Full claim: *Frequent between-meal consumption of foods high in sugars and starches promotes tooth decay. The sugar alcohols in this food do not promote tooth decay.* On small packages only: *Does not promote tooth decay.*

Appendix 1–8 FDA-Approved Terminology for Food Labels

cholesterol-free A food for which a serving meets all of the five following requirements: contains less than 2 mg of cholesterol; contains 5 g or less of total fat; is 20% or less total fat on a dry weight basis; has 2 g or less saturated fatty acids; and is 6% or less saturated fatty acids on a dry weight basis.

extra lean Description of the fat content of meat, poultry, seafood, or game meat that contains less than 5 g fat, less than 2 g saturated fat, and less than 95 mg cholesterol per serving and per 100 g.

free A food or product that contains no amount of or physiologically inconsequential amounts of fat, saturated fat, cholesterol, sodium, sugar, or calories.

good source One serving of a food or product that contains 10% to 19% of the Daily Value for a particular nutrient.

healthy A food low in fat and saturated fat with limited amounts of cholesterol and sodium. Additionally, single-item foods must contain 10% or more of vitamin A, vitamin C, iron, protein, or fiber while not exceeding 360 mg sodium; meal-type products must provide 10% of 2 or 3 of these nutrients as well as not exceeding 480 mg of sodium per serving.

high A product that contains 20% or more of the Daily Value for a particular nutrient.

lean Description of the fat content of meat, poultry, seafood, or game meat that contains less than 10 g fat, less than 4.5 g saturated fat, and less than 95 mg cholesterol per serving and per 100 g.

less A food containing 25% less of a nutrient or of calories than the reference food.

light 1. A nutritionally altered product that contains either $\frac{1}{3}$ fewer calories or half the fat of the reference food. If the caloric content of the reference food is derived 50% or more from fat, then the reduction must reduce the fat by 50%. **2.** A reduction by 50% in the sodium content of a low-calorie, low-fat food.

low A food or product that can be consumed in large amounts without exceeding the Daily Value for the referenced nutrient.

low cholesterol A food for which a serving meets all of the six following requirements: contains 20 mg or less of cholesterol; contains 0.2 mg or less total fat on a dry weight basis; contains 5 g or less of total fat per serving; is 20% or less total fat on a dry weight basis; contains 2 g or less saturated fatty acids per serving; and is 6% or less saturated fatty acids on a dry weight basis.

more One serving of a food that contains at least 10% more of the Daily Value of a nutrient than the reference food. This 10% rule also applies to the claims of fortified, enriched, added, extra, and plus, specifically where the food has been altered to attain the increase in nutrient content.

SOURCE: The Food and Drug Administration's Final Rule on Food Labeling: Definitions of the terms Cholesterol-Free and Low Cholesterol were published in the July 19, 1990 Federal Register.

APPENDIX 2

Integrative Therapies: Complementary and Alternative Medicine

Appendix 2–1 Herbal Medicines and Their Uses

Common Name	*Uses*	*Adverse Reactions and Contraindications*	*Interactions*	*Route/Commonly Used Doses*
aloe	**External:** Heals burns/sunburns, wounds, skin irritation; used as anti-infective agent, moisturizer. **Internal:** Used as laxative and for general healing.	Contact dermatitis, intestinal contractions. Avoid oral use in various GI conditions (i.e., obstruction, inflammation), ulcers, abdominal pain, menstruation, kidney conditions.	May increase risk associated with cardiac glycosides. Use with other K+-wasting drugs may add to hypokalemic effect of aloe.	**PO:** *Capsules*— 50–200 mg daily; *gel*— 30 ml t.i.d.; *tincture (1:10, 50% alcohol)* — 15–60 drops. **Top:** Aloe gel can be applied liberally to affected area 3–5 times daily.
anise	Common cold, cough/bronchitis, fevers, liver and gallbladder complaints, loss of appetite.	Occasional allergic reactions (skin, respiratory, and GI). Avoid if allergy to anise exists.	Excessive doses may interfere with anticoagulants, MAO inhibitors, and hormone therapy.	**PO:** *Dried fruit*— 0.5–1 g; *essential oil*— 50–200 ml; *tea*— 3 times daily.
arnica	**External:** Used after injuries (bruises, dislocations, contusions, muscular and joint problems). Inflammation caused by insect bites.	Prolonged use on broken skin may cause edematous dermatitis with pustular formations. Eczema (long-term use). Use of higher concentrations may cause toxic skin reactions with vesicle formation and necrosis. Avoid use on broken skin; avoid if allergy to arnica and plants in Asteraceae family exists.	None known.	**Top:** Typical strength is 2 g of flower heads in 100 ml of water. For poultice, dilute tincture 3–10 times with water. For mouthwash, dilute tincture 10 times with water.
black cohosh	Premenstrual symptoms, perimenopausal and postmenopausal symptoms such as hot flashes, depression, mood swings, profuse sweating, and sleep disorders.	GI discomfort (occasionally). Avoid during pregnancy and lactation.	None known.	**PO:** *Dried root*— 0.3–2 g 3 times daily; *liquid extract (1:1, 90% alcohol)*— 0.3–2 ml. Do not use for more than 6 mo.

brewer's yeast	Common cold, cough/bronchitis, dyspepsia, eczema, acne, fevers, inflammation (oral, pharyngeal), loss of appetite, prevention of infections.	Allergic skin reactions may occur. Migraine headaches may be triggered in susceptible patients. GI gas may result from large doses. Avoid during pregnancy and lactation.	Concurrent use with MAO inhibitors can cause an increase in BP.	**PO:** 6 g of brewer's yeast daily.
camphor	**External:** Pain relief for warts, cold sores, hemorrhoids, muscular aches. Antipruritic. Inflammatory conditions of the respiratory tract. **Internal:** Circulatory regulation disorders, catarrhal diseases of the respiratory tract (internal use is unsafe and should be avoided).	Skin irritation (local effect), contact dermatitis may occasionally occur following application of oily salves with camphor. Avoid during pregnancy and lactation. Avoid if GI conditions (infectious, inflammatory) exist.	None known.	**Top:** 0.1–3% 3–4 times daily for cold sores, antipruritic agent, hemorrhoids. **Inhaln:** 1 tbsp of camphor solution per quart of water in a hot steam vaporizer or bowl up to 3 times daily.
chamomile	**External:** Inflammation of skin and mucous membranes, bacterial skin diseases including oral cavity and gums. Respiratory tract inflammation and irritation. Anogenital inflammation. **Internal:** GI spasms and inflammatory conditions.	Contact dermatitis, severe hypersensitivity reactions, anaphylaxis, vomiting. Avoid during pregnancy and lactation.	None known.	**PO:** *Dried flower heads*— 2–8 g 3 times daily; *tea*— 1 cup of tea 3–4 times daily. Tea is made by steeping 3 g of flower heads in 150 ml of boiling water for 10 min. *Liquid extract*— 1–4 ml 3 times daily.
comfrey	**External:** Bruises and sprains.	No adverse reactions known. Avoid during pregnancy and lactation. Do not use on broken or abraded skin.	None known.	**Top:** 5–20% comfrey ointment. Use should be limited to 10 days.
dill	Dyspepsia, fever, colds, cough, bronchitis, digestive aid.	Contact dermatitis. No contraindications known.	None known.	**PO:** *Dill seeds*— 3 g; *dill oil*— 100–300 mg/day.

Herbal Medicines and Their Uses (Continued)

Common Name	*Uses*	*Adverse Reactions and Contraindications*	*Interactions*	*Route/Commonly Used Doses*
echinacea	Cold remedy, cough and bronchitis, fevers, wounds and burns, inflammation of the mouth and pharynx.	Tingling sensation on tongue, nausea, vomiting, allergic reaction, fever. Avoid if multiple sclerosis, leukoses, collagenoses, AIDS, or tuberculosis is present; avoid if hypersensitivity and cross-sensitivity exist in patients allergic to sunflower seeds and the daisy family, including ragweed; avoid during pregnancy and lactation.	May possibly interfere with immunosuppressant agents because of its immunostimulant activity.	**PO:** *Fluid extract*— 1–2 ml t.i.d.; *solid form (6.5:1)*— 300 mg t.i.d. Should not be used for more than 8 weeks at a time.
eucalyptus	Cough/bronchitis, rheumatism, catarrhs of the respiratory tract.	Nausea, vomiting, and diarrhea may occur after ingestion of eucalyptus (rare). Avoid if severe liver disease, GI tract and bile duct inflammation, hypotension, or kidney inflammation is present.	Induction of liver enzymes, which may increase the metabolism of other drugs.	**PO:** *Eucalyptus oil*— 300–600 mg/day. **Top:** *Eucalyptus oil (5–20%) in vegetable oil or semisolid preparations,* used for local application by diluting 30 ml of oil in 500 ml of lukewarm water.
fennel	Dyspepsias, catarrhs of the respiratory tract.	Allergic reactions (skin and respiratory tract) have been reported. Avoid during pregnancy and lactation.	None known.	**PO:** *Dried fruit/seed*— 5–7 g/day; *tea*— 1 cup daily. Tea is made by steeping 1–2 g of ground seed/fruit in 150 ml boiling water for 10 min and then straining.
feverfew	Prophylaxis of migraine headaches, fever, arthritis.	Dizziness, heartburn, indigestion, inflammation (lips, mouth, tongue), light-headedness, mouth ulceration, and weight gain. Allergic contact dermatitis (reported with many species of feverfew). Avoid during pregnancy and lactation.	May inhibit platelet activity (avoid use with warfarin or other anticoagulants).	**PO:** 50–125 mg of freeze-dried leaf per day with food.

garlic	Reduction of BP and serum cholesterol level.	GI irritation (rare), allergic reactions, alters intestinal flora. No contraindications known when used in normal amounts.	Decreases platelet aggregation (may affect warfarin and other anticoagulant therapy).	**PO:** One clove of fresh garlic 1–2 times daily.
ginger	Prevention and treatment of nausea and vomiting associated with motion sickness. Prevention of postoperative nausea and vomiting. May be used for dyspepsia, flatulence, and relief of joint pain in rheumatoid arthritis.	Minor heartburn, dermatitis. Avoid during pregnancy and lactation (if using amounts larger than those typically found in food); avoid if gallstones exist. Use cautiously in patients with increased risk of bleeding or diabetes.	**Natural Product–Drug:** may theoretically increase risk of bleeding when used with anticoagulants and antiplatelet agents. **Natural Product–Natural Product:** may theoretically increase risk of bleeding when used with other herbs that have anticoagulant or antiplatelet activities.	**PO:** 1000 mg ginger taken 3–60 min before travel for motion sickness or before surgery.
ginkgo	Symptomatic relief of organic brain dysfunction (dementia syndromes, short-term memory deficits, inability to concentrate, depression), intermittent claudication, vertigo and tinnitus of vascular origin.	Dizziness, headache, upset stomach, allergic skin reaction, palpitations. Avoid if hypersensitivity exists; avoid during pregnancy and lactation.	**Natural Product–Drug:** theoretically may potentiate effects of antiplatelet agents and MAO inhibitors. **Natural Product–Natural Product:** may increase risk of bleeding when used with other herbs with antiplatelet effects (some include angelica, arnica, chamomile, feverfew, garlic, ginger, and licorice).	**PO:** *native dry extract*— 120–240 mg in 2 or 3 doses for organic brain syndromes; 120–160 mg in 2 or 3 doses for intermittent claudication, vertigo, and tinnitus.

Herbal Medicines and Their Uses (Continued)

Common Name	*Uses*	*Adverse Reactions and Contraindications*	*Interactions*	*Route/Commonly Used Doses*
ginseng	Improving physical stamina, general tonic to energize during times of fatigue and inability to concentrate, sedative, sleep aid, antidepressant, diabetes.	Depression, dizziness, headaches, insomnia, hypertension, tachycardia, amenorrhea, vaginal bleeding, skin eruptions, estrogen-like effects, mastalgia, Stevens-Johnson syndrome. Avoid during pregnancy and lactation; avoid if manic-depressive disorders or psychosis exists.	**Natural Product–Food:** may potentiate effects of caffeine in coffee or tea. **Natural Product–Drug:** may decrease anticoagulant activity of warfarin. Avoid concomitant use with warfarin, heparin, aspirin, and NSAIDs. May interfere with phenelzine treatment and cause headache, tremulousness, and manic episodes. May potentiate the toxic effects of corticosteroids. **Natural Product–Natural Product:** may increase risk of bleeding when used with herbs that have antiplatelet or anticoagulant activities.	**PO:** *capsule*— 200–600 mg/day; *root powder*— 0.6–3 g 1–3 times daily.
goldenseal	Infections of the mucous membranes (bacterial and fungal), conjunctivitis, and GI infections associated with diarrhea, cirrhosis, gallbladder inflammation, and cancer. Topically used to treat eczema, acne, itching.	CNS stimulant, hallucinations, occasionally delirium, nausea, vomiting, constipation, ulceration (vaginal use), may affect production of B vitamins in colon. Avoid during pregnancy and lactation; avoid if hypertension exists.	**Natural Product–Drug:** May theoretically interfere with antacids, sucralfate, and H_2 antagonists. May interfere with antihypertensive agents and anticoagulants. May have additive effects when used concurrently with other drugs with sedative properties. **Natural Product–Natural Product:** concurrent use with herbs that have sedative properties may potentiate sedative effects.	**PO:** *dried root and rhizone*— 0.5–1 g t.i.d.; *liquid extract*— (1:1 in 60% ethanol)— 0.3–1 ml t.i.d.; *tincture*— (1:10 in 60% ethanol)— 2–4 ml t.i.d. **Top:** used as mouthwash 3–4 times daily.

hawthorn	Hypertension, mild to moderate CHF, angina, spasmolytic, sedative.	Agitation, dizziness, headache, sedation (high dose), sleeplessness, hypotension (high dose), palpitations, nausea. Avoid during pregnancy.	**Natural Product–Drug:** increases vitamin C utilization in body, may inhibit metabolism of ACE inhibitor, potentiates effect of cardiac glycosides, concurrent use with other coronary vasodilators (theophylline, caffeine, epinephrine) may potentiate vasodilatory effects, may have additive CNS depressant effect when used with other CNS depressants. **Natural Product–Natural Product:** additive effect with other cardiac glycoside–containing herbs (digitalis leaf, black hellebore, oleander leaf).	**PO:** *Hawthorn fluid extract (1:1 in 25% alcohol)*— 0.5–1 ml t.i.d.; *hawthorn fruit tincture (1:5 in 45% alcohol)*— 1–2 ml t.i.d.; *dried hawthorn berries*— 300–1000 mg t.i.d.
kava-kava	Anxiety, stress, restlessness, insomnia, mild muscle aches and pains.	Dizziness, headache, sedation, sensory disturbances, pupil dilation, visual accommodation disorders, gastrointestinal complaints, allergic skin reactions, yellow discoloration of skin, pellagroid dermopathy, weight loss, ataxia, muscle weakness. Avoid during pregnancy and lactation; avoid if endogenous depression exists. Do not give to children under 12 yr of age.	**Natural Product–Drug:** additive effect when used with alprazolam. Potentiates effect of CNS depressants (ethanol, barbiturates, benzodiazepines), has decreased the effectiveness of levodopa in a few cases. May have additive effects with antiplatelet agents and MAO inhibitors. **Natural Product–Natural Product:** May have additive sedative effects when used with other herbs with sedative properties.	**PO:** *dried kava root extract*— 100–250 mg for antianxiety; *kavalactones*— 180–210 mg for insomnia.

Herbal Medicines and Their Uses (Continued)

Common Name	*Uses*	*Adverse Reactions and Contraindications*	*Interactions*	*Route/Commonly Used Doses*
ma-huang	Asthma, hay fever, colds, weight-loss aid.	Increased BP and heart rate and cardiac arrhythmias, insomnia, motor restlessness, headaches, nausea, vomiting, anxiety. Avoid during pregnancy and lactation. Avoid if heart disease, hypertension, diabetes, hyperthyroidism, or BPH is present.	Potentiates sympathomimetic effects of antihypertensives, antidepressants, MAO inhibitors, and caffeine.	**PO:** *Ephedra*— 15–30 mg of 2–3 times daily; *crude herb*— 500–1000 mg 2–3 times daily.
milk thistle	Cirrhosis, chronic hepatitis, gallstones, psoriasis.	Mild laxative, mild allergic reaction. Avoid during pregnancy and lactation.	None known.	**PO:** *Extract (70%)*— 200–400; *dried fruit/seed*— 12–15 g/day; *tea*—3–4 times daily 30 min before meals. *Tea*—steep 3–5 g of crushed fruit/seed in 150 ml boiling water for 10 min and then straining.
mugwort	GI ailments (colic, diarrhea, constipation), worm infestations, persistent vomiting, hysteria, epilepsy, menstrual problems and irregular periods; as a sedative.	Allergic reactions. Avoid during pregnancy and lactation.	None known.	**PO:** *Tincture*— 5 ml 30 min before bedtime or 1–4 ml up to 3 times daily.
nettle	Urinary tract infections, kidney and bladder stones. Supportive therapy for rheumatic ailments.	Allergic reactions (rare). Avoid during pregnancy and lactation.	None known.	**PO:** *Tea*— 1 cup up to 3 times daily with adequate fluid intake; steep 1.5–6 g of nettle in 150 ml of boiling water for 10 min and then straining. *Dried extract (7:1)*— 770 mg twice daily; *liquid extract (1:1, 25% alcohol)*— 3–4 ml 3 times daily. **Top:** *Tincture (1:10)* for external use.

oak bark	External: Inflammatory skin disease. Internal: diarrhea (nonspecific, acute), mild inflammation of oral and pharyngeal regions and genital and anal areas.	GI disturbances, kidney damage, liver necrosis. Avoid during pregnancy and lactation. Avoid oak bark baths if weeping eczema, large areas of skin damage, febrile or infectious disease, cardiac insufficiency is present.	May reduce or inhibit the absorption of alkaloids and other alkaline drugs.	**PO:** For diarrhea, 1 cup of tea up to 3 times daily for 3–4 days. Tea is made by steeping 1 g coarsely ground bark in 150 ml of boiling water and then straining. **Top:** For rinses, compresses, gargles, use 20 g bark in 1 liter of water. For baths, use 5 g bark in 1 liter of water and add to bath water. Topical use should be limited to 2–3 week.
pennyroyal	External: Skin diseases. Internal: Digestive disorders, liver and gallbladder disorders, gout, colds, and increased urinary frequency.	Abortifacent in high doses. Hepatotoxicity (use not recommended because of hepatoxicity). Avoid during pregnancy and lactation.	None known.	Use not recommended because of toxicity.
peppermint	Colds, coughs, inflammation of mouth and pharynx, GI cramps and as an antiflatulent and antipyretic agent. The oil is used topically for myalgias, toothaches, pruritus, urticaria and as an antiinfective agent.	Heartburn when taken orally. Allergic reactions (headache and flushing). External use may cause skin irritation and contact dermatitis. In small children and babies, the oil may cause bronchial spasms and collapse when applied to their facial, nasal, or chest areas. Avoid during pregnancy and lactation. Avoid use of oil on infants/small children. Avoid if hypersensitivity to peppermint exists. Avoid if bile duct obstruction, severe liver disease, or gallbladder inflammation is present.	Gastric acid–blocking drugs.	**PO:** *Peppermint oil*— 0.2–0.4 ml 3 times daily in diluted preparation; *capsules*— 1–2 capsules 3 times daily (0.2 ml/capsule). **Top:** 5–20% peppermint oil in oily preparations, 5–10% in aqueous/ethanol preparations, 1–5% in nasal preparations. To apply, rub small amount on affected skin areas. **Inhaln:** 3–4 drops of oil placed in hot water and inhaled. Inhalation contraindicated in children.

Herbal Medicines and Their Uses (Continued)

Common Name	*Uses*	*Adverse Reactions and Contraindications*	*Interactions*	*Route/Commonly Used Doses*
psyllium	Constipation, diarrhea, lowering serum cholesterol	Flatulence, abdominal distention, esophageal/bowel obstruction if not taken with water/fluid. Allergic reactions. Avoid if fecal impaction, GI tract obstruction or narrowing is present.	Interferes with absorption of other drugs taken simultaneously.	**PO:** 3.5 g 1–3 times daily of the seed husk taken with adequate fluids.
Saint John's wort	Management of mild to moderate depression. Externally used for inflammation of the skin, blunt injuries, wounds, and burns.	Dizziness, restlessness, sleep disturbances, fatigue, hypertension, GI side effects, abdominal pain, bloating, constipation, dry mouth, feeling of fullness, flatulence, nausea, vomiting, allergic skin reactions, phototoxicity, photodermatitis. Avoid during pregnancy and lactation. Do not give to children.	Concurrent use with alcohol or other antidepressants may increase the risk of adverse reactions. Concurrent use with indinavir may significantly reduce blood concentrations of indinavir.	**PO:** *hypericum extract*— 300 mg t.i.d. for depression. **Top:** *hypericin*— 0.2–1 mg daily.
saw palmetto	Urination problems in BPH, irritable bladder.	Headaches, stomach problems (rare). Avoid during pregnancy and lactation; avoid if breast cancer exists.	Oral contraceptives and hormone therapy (possible).	**PO:** *Dried berry*— 0.5–1 g of dried berry three times daily; *tea*— 1 cup of tea 3 times daily. Tea is made by steeping 0.5–1 g of dried berry in 150 ml of boiling water for 10 min and then straining. *Saw palmetto extracts with 80–90% fatty acids*— 160 mg twice daily.

spruce	Colds, cough, bronchitis, fevers, inflammation of the mouth and pharynx.	May worsen bronchial spasms. Avoid during pregnancy and lactation. Avoid if asthma or whooping cough exists. Avoid baths with spruce if extensive skin damage, acute skin diseases, fevers, infectious diseases, or cardiac insufficiency is present.	None known.	**PO:** *Fresh shoots*— 5–6 g/per day. *Essential oil*— given as 4 drops in water or with sugar 3 times daily. **Top:** 200–300 g of shoots boiled in 1 liter of water; steep for 5 min, strain, and add to full bath. **Inhaln:** Inhale 2 g of oil in hot water several times daily.
uva-ursi	Urinary tract infections.	Nausea, vomiting, GI upset, hepatotoxicity, high toxic doses (30–100 g of uva-ursi) can cause death. Avoid during pregnancy and lactation. Avoid if kidney disorders or GI irritable disorders exist. Do not give to children.	Use with urine-acidifying drugs may reduce the efficacy of uva-ursi.	**PO:** 1 cup of tea up to 4 times daily. Tea is made by steeping 3 g of dried leaf in 150 ml cold water for 12–24 hr and then straining. This herb should not be used for more than 1 week at a time, no more than 5 times a year.
valerian	Restlessness, sleeping disorders due to nervous conditions.	Morning drowsiness, headaches, excitability, insomnia. Avoid during pregnancy and lactation.	Use with alcohol and other sedatives may potentiate sedative effects	**PO:** *Extract (0.8% valeric acid)* — 150–300 mg 30 min before bedtime. *Tea*— 1 cup 1–3 times daily. Tea is made by steeping 2–3 g of root in 150 ml of boiling water for 10 min and then straining.
woodruff	Nervousness, sleeplessness, hysteria, cardiac irregularity.	Headache, stupor (high doses). Liver damage (reversible) may occur with long-term use in susceptible patients. Avoid during pregnancy and lactation.	None known.	**PO:** 1 cup of tea once a day, shortly before bedtime. Tea is made with 2 teaspoonfuls (1.8 g) in one glass of water.

BPH: benign prostatic hyperplasia; Inhaln: Inhalation; PO: by mouth; PSA: prostate-specific antigen; Top: topical.
* NOTE : Instruct patient to consult health care professional before taking any prescription or OTC medications concurrently with any of these herbal products. The purity, safety, and effectiveness of many herbal remedies remain untested and unproven.
SOURCE: Deglin, JH and Vallerand, AH: Davis's Drug Guide for Nurses (9th ed.), F.A. Davis, Philadelphia, 2005.

Appendix 2–2 Forms of Herbal Preparations

bath A form of hydrotherapy. Immerse the full body in a bath with 500 ml or 1 pint of infusion or decoction. The full-strength herbal infusion or decoction is used for foot or hand baths.

capsule or pill Powdered herbs may be enclosed in gelatin capsules or pressed into a hard pill. The powder can also be rolled into a pill with bread or cream cheese. This is one of the most common ways herbs are supplied and used.

compress A clean cloth is soaked in an herbal infusion or decoction and applied over injured or inflamed areas. Also called a fomentation.

crude herb The fresh or dried herb in an unprocessed form. Measurements are expressed by weight.

decoction An aqueous preparation of hard and woody herbs, which are made soluble by simmering in almost boiling water for 30 minutes or more. If the active ingredients are volatile oils, it is important to cover the pan to prevent vaporization. The decoction is then strained while hot and either stored or consumed as needed.

essential oils Volatile oils, usually mixtures of a variety of odoriferous organic compounds of plants.

extract Concentrated form of natural products obtained by treating crude herb with solvent and then discarding the solvent to result in a fluid extract, solid extract, powdered extract, or tincture. Strength is expressed as the ratio of the concentration of the crude herb to the extract (e.g., 5:1 means five parts crude herb is concentrated in 1 part extract, and 1:2 means one part of extract is comparable to 0.5 parts herb).

fluid extract Concentrated tinctures with a strength of one part solvent to one part herb.

fomentation A clean cloth is soaked in an herbal infusion or decoction and applied over injured or inflamed areas.

infusion The preferred method used for soft plant parts such as leaves, flowers, or green stems, an infusion is prepared just like making a tea. In the case of volatile oils or heat-sensitive ingredients, soaking in water or milk for 6 to 12 hours in a sealed earthenware pot makes a cold infusion.

liniment Usually a mixture of herbs and alcohol or vinegar to be applied topically over muscles and ligaments.

lozenge Dissolvable tablet often used for upper respiratory and throat problems. It is made by combining a powdered herb with sugar and viscous jelly obtained from either an edible gum or mucilaginous plant.

ointment An herb or mixture of herbs in a semi-solid mixture such as petroleum jelly. This is applied externally for injuries or inflammation. If made with volatile oils, it can even be used as a respiratory anticatarrhal. Also known as a salve.

poultice A raw or mashed herb applied directly to the body or wrapped in cheesecloth or other clean cloth. It is used either hot or cold for bruises, inflammation, spasm, and pain.

powdered extract A solid extract which has been dried to a powder.

salve An herb or mixture of herbs in a semi-solid mixture such as petroleum jelly. This is applied externally for injuries or inflammation. If made with volatile oils, it can even be used as a respiratory anticatarrhal.

tincture An alcohol-based preparation. Alcohol is a better solvent than water for many plant ingredients, so mixing herbs in alcohol such as vodka or wine with a specific water/alcohol ratio is a common method of extraction. The mixture is soaked for about 2 weeks. Then the herbs are strained out and the liquid is saved in a dark, well-stoppered bottle. Tinctures are much stronger volume-for-volume than infusions or decoctions. Strengths are typically 1:5 to 1:10.

tea Made by steeping herbs in hot water (The same as an *Infusion*). Place 1 tsp dried herb or 2 to 3 tsp fresh herb into 1 cup (250 ml) hot or boiling water. Steep for 5 to 15 minutes. For larger quantities, use 1 oz (30 g) of herb in 1 pint (500 ml) of hot water. Bruise or powder seeds before making an infusion or tea. The shelf life of these bioactive fluids is short, even in the refrigerator. Discard them after 8 to 12 hours.

Appendix 2–3 Premises of Mind-Body Medicine

Mind and body are simply two aspects of a whole individual. The mind is no less medically real and significant than the body.
Every person has self-healing abilities.
Each person is unique, and must be responded to as such. To be most effective, the treatment program must be individualized for each person.
Each person is an integration of physical, psychological, intellectual, and spiritual aspects. All aspects are equally important. All must be addressed in the approach to health.
Patients' healing abilities are strongly affected by their expectations and beliefs. The expectations, attitudes, beliefs, and words of practitioners strongly influence the expectations of their patients.
Mainline medicine does not have a monopoly on the search for health.
Patients need to be actively involved in their own healing and in the decision making concerning their treatments.

Appendix 2–5 Alternative Therapies for Anxiety

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Valerian (150—300 mg t.i.d.; 1–3 ml of tincture t.i.d.); kava-kava (45–70 mg kavalactones t.i.d.); Saint John's wort (300 mg t.i.d.).	Chamomile; hops; oats (oat straw); passion flower; peppermint; skullcap.	Aromatherapy.
Diet and Nutrition/Lifestyle	High-potency multivitamin; exercise; eliminate caffeine, alcohol, tobacco, sugar.	Flaxseed oil (1 T/day); magnesium (200–300 mg t.i.d.); niacinamide (500 mg q.i.d.); phosphatidyl choline (4 g t.i.d.).	
Mind-Body Interventions	Biofeedback; cognitive-behavioral therapy; deep breathing; group therapy; hypnotherapy; meditation; relaxation response; spiritual healing.	Dance; music; qi gong; tai chi; yoga.	
Bioelectromagnetic Therapies	Craniostimulation; energy healing.		Electrosleep.
Alternative Systems of Care	Acupuncture; ayurveda.	*Homeopathic:* gelsemium 30C t.i.d.–q.i.d.; argentum nitricum 6C t.i.d.–q.i.d.; ignatia amara 6C t.i.d.–q.i.d.	
Hands-On Healing Techniques	Massage.	Chiropractic.	Craniosacral therapy.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–6 Alternative Therapies for Arthritis

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Boswellia (150–400 mg t.i.d.); capsaicin (topically); ginger concentrate (500 mg t.i.d.).	White willow (60–120 mg/day salicin; 1–2 ml t.i.d. tincture).	Aromatherapy; devil's claw; horsetail; sea cucumber; yucca.
Diet and Nutrition/Lifestyle	Weight loss; exercise; vitamin C (500–1000 mg t.i.d.); vitamin E (400–800 IU/day).	Vitamin B_3 (niacinamide): (1–3 g/day), check liver enzymes; boron 6 mg/day; omega-3 fatty acids (fish oil) 3 g/day.	Eliminate solanine from diet (found in nightshade plants: tomatoes, white potatoes, peppers [except black pepper], eggplant, tobacco); copper bracelet or supplement; D-phenylalanine; pantothenic acid; zinc.
Mind-Body Interventions	Cognitive-behavioral therapy.	Biofeedback; qi gong; relaxation; social support; tai chi; yoga.	Guided imagery; meditation; music.
Pharmacological and Biological Treatments	Glucosamine sulfate (500 mg t.i.d. or as single dose); S-adenosyl- L -methionine (SAMe) (400 mg t.i.d.).	Chondroitin sulfate (400 mg t.i.d.).	DMSO; chelation therapy; shark and bovine cartilage.
Bioelectromagnetic Therapies		Static magnet therapy; pulsed electromagnetic fields; TENS.	
Alternative Systems of Care	Acupuncture; acupressure; ayurveda; traditional Chinese medicine.		Homeopathy: *Gout:* nux vomica 6C; belladonna 6C; calcarea 6C; colchicum 6C. *Osteoarthritis:* Rhus toxicodendron 6C t.i.d. for 2 weeks; ledum 6C q.i.d. for 2 weeks; *belladonna* 6C q.i.d for 2 weeks; *Apis millifica* 6C t.i.d. for 2 weeks. *Rheumatoid arthritis:* Rhus toxicodendron 6C for 2 weeks; bryonia 6C q.i.d. for 2 weeks; ruta graveolens 6C q.i.d. for 2 weeks; pulsatilla 30C t.i.d. for 2 weeks; arnica ointments and gels.
Hands-On Healing Techniques	Physical therapy.	Massage; chiropractic; osteopathy.	Craniosacral therapy; rolfing.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.

Appendix 2–7 Alternative Therapies for Asthma

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Atropa belladona; capsaicin; ephedra sinensis (12.5–25 mg t.i.d.); quercetin (400 mg ac t.i.d.); glycyrrhiza glabra (1–2 g t.i.d. powdered root; 2–4 ml t.i.d. extract; 250–500 mg dry powdered extract t.i.d.); grape seed extract (50–100 mg t.i.d.); guaiac wood (guafenisin 600 mg b.i.d.).	Ginkgo biloba (60 mg b.i.d.); tylophora asthmatica (200 mg b.i.d.).	Coleus forskohli (50 mg t.i.d.); lobelia inflata; coltsfoot (potentially toxic).
Diet and Nutrition/Lifestyle	Avoid sulfites, aspirin, tartrazine, biogenic amines; environmental control; vitamin C (10–30 mg/kg/day in divided doses).	Carotenes (25,000–50,000 IU/d); essential fatty acids (fish oils, omega-3 fatty acids); magnesium (200–400 mg t.i.d.); vitamin E (200–400 IU/d); zinc (15–30 mg/d); food allergy identification and avoidance (milk, egg, wheat); green tea (*Camellia sinensis*); onions, garlic; reduced sodium intake.	Treat hypochlorhydria; probiotics; selenium (200 μg/day); vitamin B_6 (if on theophylline: 25–50 mg b.i.d.); vitamin B_{12} (sulfite-sensitive children: 1000 μg/d or IM weekly).
Mind-Body Interventions		Biofeedback; hypnosis; yoga breathing techniques.	Treat depression; stress management.
Pharmacological and Biological Treatments			Anti-*Candida* diet; DHEA.
Bioelectromagnetic Therapies			Electrical stimulation.
Alternative Systems		Acupuncture; African herbs; ayurvedic herbals; Chinese herbals; homeopathy.	
Hands-On Healing Techniques	Massage.		Chiropractic; osteopathy.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–8 Alternative Therapies for Cancer Prevention and Treatment

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Mistletoe (bladder); yew (paclitaxol) (breast); hoxsey; astragalus membranaceus; polysaccharide krestin; chlorella; capsaicin.	Chaparral (toxic); Pau d'arco; essiac tea; evening primrose oil.
Diet and Nutrition/Lifestyle		Mushrooms: maitake, shiitake (colon), enokitake.	Whole grain barley; macrobiotic diet; Gerson diet; Hippocrates wheat grass diet; Livingston-Wheeler; Kelley-Gonzales nutritional programs; vitamins A, C, E (controversial).
Mind-Body Interventions		Getting rid of anger, negative emotions; support groups (breast); group therapy (melanoma); stress management; treatment of depression, feelings of helplessness, hopelessness; encouraging a fighting spirit; imagery, biofeedback, hypnosis, meditation; yoga, qi gong; spiritual approaches, prayer, faith healing.	Intuitive, psychic approaches.
Pharmacological and Biological Treatments			Antineoplastins (brain); shark cartilage; bovine tracheal cartilage; hydrazine (cachexia, lung); ozone therapy, hydrogen peroxide; Livingston therapy; immunoaugmentive therapies; melatonin.
Bioelectromagnetic Therapies			Nordenstrom electrical stimulation; therapeutic touch.

Alternative Systems of Care	Acupuncture, acupressure, moxibustion for relief of pain, nausea, side effects of cancer treatment.	Chinese herbal remedies; ayurveda; *Homeopathy:* gelsemium 6C (anxiety) 2–3×; ipecac 30C (nausea) 3–4× q 15–30 min; nux vomica (nausea/vomiting) 6C t.i.d.–q.i.d. for 1–2 days; cadmium; sulfuricum 30C (vomiting, exhaustion) t.i.d. for 1–2 days.
Hands-On Healing Techniques	Massage and gentle manipulation for pain control, immunostimulation, relaxation.	Laying on of hands.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–9 Alternative Therapies for Congestive Heart Failure

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Hawthorn (80–300 mg b.i.d., tincture 4–5 ml t.i.d.).		Cinnamon (2–3 mg/day, tincture 2–3 ml t.i.d.).
Diet and Nutrition/Lifestyle	Coenzyme Q10 (30–100 mg t.i.d.); magnesium (300 mg/day); thiamine (20–100 mg/day).	Carnitine (500 mg b.i.d.–t.i.d.); taurine (3–6 g/day).	L -Arginine (1500 mg–12 g/day).
Mind-Body Interventions	Relaxation and stress management; screen and treatment for depression; guided imagery.	Cognitive-behavioral therapy; social support; anger/hostility management; meditation; tai chi; yoga.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–10 Alternative Therapies for Coronary Artery Disease

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Ginkgo biloba (40 mg t.i.d.); garlic (900 mg/day or 1 clove); curcumin (400 mg t.i.d.); green tea (3–5 C/day).	Khella (250–300 mg/day); eleutherococcus (Siberian ginseng) (2–3 g/day); gugulipid (25 mg/t.i.d.)—lipid-lowering agent. Evening primrose oil (3–6 g/day).
Diet and Nutrition/Lifestyle	Exercise; eliminate tobacco, caffeine, alcohol; low-fat diet/dietary antioxidants; Ornish program; vegetarian diets; vitamin C (1 g/day); vitamin E (400–800 IU/day); vitamin B_6 (50–100 mg/day); vitamin B_{12} (800 μg/day); folic acid (800 μg/day).	Resveratrol (red wine) and other bioflavonoids; consumption of nuts; selenium (100–200 μg/day); pantethine (300 mg t.i.d.).	
Mind-Body Interventions	Relaxation and stress management; screen and treat for depression; guided imagery.	Cognitive-behavioral therapy; social support; anger/hostility management; meditation; tai chi; yoga.	
Pharmacological and Biological Treatments			Chelation therapy.
Alternative Systems of Care		Acupuncture; traditional Chinese medicine; ayurveda.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–11 Alternative Therapies for Depression

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Ginkgo biloba (80 mg t.i.d.) in elderly; Saint John's wort (300 mg t.i.d., 0.3% hypericin).	Saint John's wort and 5-HTP in combination; damiana; yohimbe; aromatherapy
Diet and Nutrition/Lifestyle	Exercise; relaxation, stress reduction; thiamine (1–10 mg/d); niacin (500–1000 mg b.i.d.); pyridoxine (50–100 mg/d); folic acid (800 μg/d); vitamin B_{12} (800 μg/d); vitamin C (500–1000 mg t.i.d.).	S-adenosyl-L-methionine (SAMe) (200 mg b.i.d.–400 mg q.i.d.). *Avoid in bipolar disorder.* 5-HT (hydroxytryptophan) (100–200 mg t.i.d.); flaxseed oil (1 T/day); iron replacement; vitamin E (200–400 IU/day).	Inositol; phenylalanine; phosphatidylserine; tyrosine; detect and treat food allergy; restrict caffeine and sugar.
Mind-Body Interventions	Cognitive-behavioral therapy; spiritual approaches, prayer.	Tai chi; qi gong; hypnosis; meditation; biofeedback.	
Pharmacological and Biological Treatments			DHEA; neural therapy.
Bioelectromagnetic Therapies	Light therapy (for seasonal affective disorder).	Magnetic brain stimulation; energy healing.	
Alternative Systems of Care	Acupuncture.	Ayurveda.	Homeopathy (not commonly used except for postpartum depression): *Each t.i.d. for 2 weeks:* sepia 30C; ignatia 30C; pulsatilla 30C; natrum muriatricum 30C.
Hands-On Healing Techniques	Massage.		

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–12 Alternative Therapies for Diabetes

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		*Artemesia herba alba;* bilberry (*Vaccinium myrtillus*) (retinopathy): 80–160 mg t.i.d.; bitter melon (*Momordica charantia*): 30–60 ml of juice/day; coccinia indica; gymnema sylvestre: 200 mg b.i.d.; ginkgo biloba (retinopathy, neuropathy, and vascular complications): 40 mg t.i.d.; garlic; green tea (*Camellia sinensis*) 2C/day; *Trigonella foenum-graecum*.	Artichoke; dandelion leaves; eleutherococcus; fenugreek (*Trigonella foenum-graecum*): 50 g/day defatted seed powder; ginseng 100 mg t.i.d.; glucomannan; guar gum; horehound; juniper; lavender; myrrh; neem; primrose oil (neuropathy); salt bush (*Atriplex halimu*); silymarin (cirrhosis in diabetes); Spanish needles (*Bidens pilosa*); tragacanth; yellow bells (*Tecoma stans*).
Diet and Nutrition/Lifestyle	Regular exercise; weight loss; diet high in fiber, low in simple sugars and fats; Pritikin diet; Ornish diet.	Alpha-lipoic acid; biotin (type 1 and type 2 DM): 9–16 mg/day; chromium (200 μg/day); essential fatty acids (cold-water fish, 480 mg/day; gamma linoleic acid (1 T/day flaxseed oil); magnesium (300–500 mg/day); onion; potassium (dietary); vitamin C (>2 g/day in divided doses); vitamin B_3 (prevention of new-onset type 1: 25 mg/kg/day); inositol hexaniacinate (hyperlipidemia: 500–1000 mg/day); vitamin B_6 (neuropathy): 50–100 mg/day; vitamin B_{12} (neuropathy: 1000–3000 μg /day p.o. or 1000 μg/wk IM); vitamin E (800–900 IU/day); zinc (30 mg/day).	Flavonoids (dietary, 1–2/day); manganese (30 mg/day).

Alternative Therapies for Diabetes (Continued)

Therapy	*Best Evidence**	*Probably Useful†*	*Least Evidence‡*
Mind-Body Interventions	Self-care, personal locus of control and responsibility.	Biofeedback; reduction of threat of DM (adolescents); relaxation therapy; social support; spiritual approaches; yoga.	Treatment of depression; qi gong.
Bioelectromagnetic Therapies			Electrical stimulation.
Alternative Systems of Care		Acupuncture (neuropathy); traditional Chinese medicine.	Ayurveda; curanderismo herbalism.
Hands-On Healing Techniques			Massage.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–13 Alternative Therapies for Gastroesophageal Reflux Disease

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Deglycyrrhizinated licorice (DGL), 380-760 mg t.i.d./ac.	Caraway; lemon balm; raspberry tea; white wine (increases gastric emptying).	Oregon grape, yellow dock, wormwood.
Diet and Nutrition/Lifestyle	Lactase (for those with lactose intolerance); lipase (pancreatic insufficiency); weight loss; small meals; don't lie down for 2 hr after a meal; elevate head of bed 6 in; avoid foods that promote reflux, like alcohol, tobacco, caffeine, onions, spicy foods, peppermint.		Proteolytic enzymes; vitamin A up to 25,000 IU/day; vitamin C 500 mg t.i.d.; vitamin E 100 IU t.i.d.; zinc 20 mg/day.
Alternative Systems of Care		Acupuncture; ayurveda.	*Homeopathy:* bryonia 6C q 30 min for 2 hr; carbo vegetabilis 6C q 30 min for 2 hr; lycopodium 6C q 30 min for 2 hr; nux vomica 6C q 30 min for 2 hr.
Hands-on Healing Techniques		Osteopathic manipulation.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–14 Alternative Therapies for Gastrointestinal Problems

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Aloe (constipation), 30 ml t.i.d.; cascara (constipation), tea from 1 tsp. bark b.i.d., 1 ml tincture b.i.d.; deglycyrrhizinated licorice (DGL) (peptic ulcer disease [PUD]), 380–760 mg t.i.d./ac; peppermint (indigestion), 0.2 ml–0.4 ml enteric coated oil b.i.d.–t.i.d./ac; senna (constipation).	Aloe (heartburn), 30 ml t.i.d.; bilberry (diarrhea); boldo (cholagogue, indigestion); caraway; chamomile (antispasmodic, colic, PUD) 2–3 g/day, 3–5 ml tincture t.i.d., as tea t.i.d.–q.i.d.; ginger (nausea), 500 mg t.i.d.; goldenseal (diarrhea) 500 mg t.i.d., use with caution; fennel (colic, antispasmodic), tea 1 cup t.i.d.; 600-mg caps t.i.d., for infants, 2 tsp seeds t.i.d.; garlic (antispasmodic), up to 3 g b.i.d.; lemon balm; marijuana (nausea); raspberry tea; sage (antispasmodic); white wine (increases gastric emptying).	Bitters (indigestion): barberry, dandelion; Oregon grape, yellow dock, wormwood; butcher's broom (hemorrhoids); horse chestnut (hemorrhoids).
Diet and Nutrition/Lifestyle	Lactase (for those with lactose intolerance); lipase (pancreatic insufficiency).	Bismuth (PUD), 240 mg subcitrate b.i.d./ac, subsalicylate 500 mg q.i.d./ac; cabbage (PUD), 1 L juice daily, effects possibly due to glutamine content; charcoal (excess gas); lactobacillus acidophilus (diarrhea, antibiotic-induced diarrhea).	Betaine HCl (low stomach acidity); flavonoids (PUD), 500 mg t.i.d.; proteolytic enzymes; yogurt (antibiotic-induced diarrhea); vitamin A, up to 25,000 IU/day; vitamin C, 500 mg t.i.d.; vitamin E, 100 IU t.i.d.; zinc, 30 mg/day.
Mind-Body Interventions	Depression (functional bowel complaints), detect and treat; exercise (constipation); psychotherapy; stress management (PUD).		

Alternative Systems of Care	Acupuncture (nausea); acupressure (nausea); ayurveda.	Homeopathy: *Colic:* cuprum metallicum 6C t.i.d.–q.i.d.; chamomile 6C t.i.d. for 3–4 days; colocynthis 30C t.i.d.; nux vomica 6C q 15 min until vomiting ceases; belladonna 6C q 1 hr for up to 6 doses; bryonia 6C q 1 hr for up to 6 doses. *Constipation:* nux vomica 6C t.i.d. for 10 days; sepia 30C: 3 doses in 24 hr once a month; sulfur 6C t.i.d. up to 10 days. *Diarrhea:* arsenicum album 6C q 30 min for up to 6 doses, then t.i.d.; argentum nitricum 6C q 1 hr up to 6 doses; podophyllum 30C t.i.d.–q.i.d. for 2 days; pulsatilla 6C q 2 hr for up to 6 doses; sulfur 6C q 1 hr up to 6 doses, then t.i.d. *Hemorrhoids:* hamamelis 6C t.i.d. for 3 days; calcarea fluorica 6C t.i.d.–q.i.d. for 3–4 days; arnica 30C q.i.d. for 2–3 days; aesculus; hippocastanum 30C t.i.d. for 3 days. *Heartburn, indigestion, and gas:* nux vomica 6C q 30 min for 2 hr; carbo vegetabilis 6C q 30 min for 2 hr; lycopodium 6C 2–3 times after meals; natrum phosphoricum 6C q 30 min for 2 hr; arsenicum album 6C q 1 hr up to 6 doses, then t.i.d.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–15 Alternative Therapies for Migraine Headache

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Feverfew 0.25-0.5 mg, parthenolide b.i.d.	Ginger 4–6 g/day, 1.5–3 ml tincture t.i.d., 500 mg q.i.d. dried ginger, also treats nausea; ginkgo biloba 40–60 mg t.i.d.	Capsaicin intranasal; yucca.
Diet and Nutrition/Lifestyle	Vitamin B_2 (riboflavin) 400 mg/day for at least 3–4 months.	Magnesium 250–400 mg t.i.d., esp. for premenstrual migraine and those with low Mg levels; calcium 800 mg/day; vitamin D 400 IU/day; avoid dietary amines, which provoke migraine: chocolate, cheese, beer, red wine; food allergy: detect and eliminate most common allergenic foods: dairy, wheat, chocolate, eggs; use elimination diet; vitamin B_{12} 25 mg t.i.d.	Fish oil, EPA/DHA; S-adenosyl-L-methionine (SAMe) 400 mg q.i.d., gradually increase dose from 200 mg b.i.d. to 400 mg q.i.d. over 3 weeks; 5-hydroxytryptophan (5-HTP) 100–200 mg t.i.d.
Mind-Body Interventions	Relaxation therapy; biofeedback.	Guided imagery; meditation; stress management; tai chi; therapeutic touch; yoga.	
Bioelectromagnetic			Energy healing; magnets; TENS.
Alternative Systems of Care		Acupuncture; traditional Chinese medicine; ayurveda.	Homeopathy: belladonna 6C q 30 min for 1.5 hrs; bryonia 6C q 30 min for 1.5 hrs; gelsemium 30C q 30 min for 1.5 hrs; kali bichromicum 6C q 1 hr up to 6 doses, then t.i.d.
Hands-On Healing Techniques			Chiropractic.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–16 Alternative Therapies for Tension Headache

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Diet and Nutrition/Lifestyle		Magnesium 250 mg b.i.d.–t.i.d.	
Mind-Body Interventions	Relaxation therapy; biofeedback; cognitive therapy.	Guided imagery; meditation; progressive muscle relaxation; stress management; tai chi; therapeutic touch; yoga.	
Bioelectromagnetic Therapies			Energy healing; magnets; TENS.
Alternative Systems of Care		Acupuncture; traditional Chinese medicine; ayurveda.	Homeopathy: belladonna 6C q 30 min for 1½ hrs; bryonia 6C q 30 min for 1½ hrs; gelsemium 30C q 30 min for 1½ hrs; kali bichromicum 6C q 1 hr up to 6 doses, then t.i.d.
Hands on Healing			Chiropractic.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–17 Alternative Therapies for Hepatitis

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Milk thistle (hepatitis, cirrhosis), 70–140 mg t.i.d.	Artichoke; *Astragalus membranaceus*; caraway; glycyrrhizin, licorice root 100 mg/day, 1 g root t.i.d., higher doses affect electrolytes, BP; goldenseal 500 mg t.i.d., use with caution; lemon balm; raspberry tea; turmeric, 250–500 mg b.i.d.	Oregon grape, yellow dock, wormwood; evening primrose oil (alcoholic liver disease); Sho-Saiko-to (TJ-9); Compound 861; *Phyllanthus amafus*.
Diet and Nutrition/Lifestyle			Proteolytic enzymes; vitamin A up to 25,000 IU/day; vitamin C 500 mg t.i.d.; vitamin E 100 IU t.i.d.; zinc 20 mg/day.
Mind-Body Interventions			Psychotherapy.
Alternative Systems of Care		Ayurveda.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–18 Alternative Therapies for Hypercholesterolemia

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Artichoke 320 mg of std extract t.i.d.; avocado; barley; evening primrose oil; flax seeds 20 g/day, 1 T flaxseed oil daily; glucomannan; pectin; plantain. Garlic 1–4 cloves/day, tabs 300 mg t.i.d. (4000–5000 μg of allicin), tincture 2–4 ml t.i.d.; Guggul 500 mg tab t.i.d. (5–10% guggelsterones or total of 25 mg t.i.d.); psyllium 5–10 g/day; Chinese red yeast rice (cholestin) (*Monascus purpureus*), two 600-mg capsules b.i.d.	Fenugreek 5–20 g with meals t.i.d. or 15–90 g once daily with a meal; fo-ti 3–5 g/day as tea t.i.d., 500-mg tabs, up to 5 tabs t.i.d.; ginseng; proanthocyanidins (grape seed extract, pine bark); wild yam 2–3 ml tincture t.i.d., 1–2 tabs t.i.d.; yogurt.
Diet and Nutrition/Lifestyle	Exercise; 5–7 servings/day fruits and vegetables (source of bioflavonoids and beta carotene); fiber; Mediterranean diet; quit smoking; soy protein 30 g/day; vegetarian diet; very low-fat diet (Ornish); vitamin B_3 (niacin) up to 3 g/day (potential hepatoxicity); weight loss.	Calcium 800–1000 mg/day; coenzyme Q10 100–200 mg/day; fish intake (EPA/DHA omega-3 oils); inositol hexaniacinate 500–1000 mg t.i.d.; olive and canola oil; Pritikin program; reduce intake of refined sugars; reduce caffeine intake; red wine or other form of alcohol 1–2 drinks/day; selenium 200 mg/day; vitamin B_5 (pantothenic acid) 300 mg b.i.d.–t.i.d. esp. for diabetics, hypertriglyceridemia; vitamin C 100–1000 mg/day; vitamin E 100–800 IU/day.	Beta-sitosterol; brewer's yeast; 2 T/day carnitine 1–4 g/day; chitosan 3–6 g/day; chromium 200 mg/day; green tea 3C/day; lecithin; magnesium 400 mg/day; mushrooms: shiitake, maitake; oats; octacosanol; vitamins B_6 (pyridoxine) 50 mg/day; B_9 (folic acid) 400 mg/day; B_{12} (cyanocobalamin) 1000 mg/day (may lower homocysteine levels, alone or together); quercetin 35 mg/day (apples, onion, black tea); safflower oil.

Alternative Therapies for Hypercholesterolemia (Continued)

Therapy	*Best Evidence**	*Probably Useful†*	*Least Evidence‡*
Mind-Body Interventions		Modifying type A behavior, stress reduction, reducing hostility, time urgency, competitiveness; reducing chronic arousal; improving sleep pattern; relaxation therapy.	Meditation; qi gong.
Pharmacological and Biological Treatments			Chelation therapy.
Alternative Systems of Care		Ayurveda; traditional Chinese medicine.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–19 Alternative Therapies for Hypertension

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Garlic; hawthorn.	Ginseng, 1 g dried root/day; guar gum, 5 g t.i.d.; yellow root; yucca.
Diet and Nutrition/Lifestyle	DASH diet; fiber; aerobic exercise; potassium in diet; quit smoking; reduce caffeine; low sodium; weight loss.	Vegetarian diet; CoQ10, 50 mg b.i.d.; alcohol intake <3 drinks/day; calcium, 800–1500 mg/day; magnesium, 350–500 mg/day (esp. if taking diuretics); fish oil, EPA/DHA, omega-3 fatty acids 3 g/day.	Check for heavy metals such as lead; reduce sugar intake; vitamin C; chitosan; arginine, 2 g t.i.d.
Mind-Body Interventions		Anger prevention or management; anxiety reduction (men); guided imagery; meditation; music therapy; religious attendance; social support; stress management; tai chi; yoga.	
Pharmacological and Biological Treatments			Chelation therapy.
Alternative Systems of Care		Ayurveda; traditional Chinese medicine.	Homeopathy.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–20 Alternative Therapies for Irritable Bowel Syndrome

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Peppermint, 0.2 ml–0.4 ml enteric-coated oil b.i.d.–t.i.d./ac	Caraway; chamomile, 2–3 g/day; 3–5 ml tincture t.i.d., as tea t.i.d.–q.i.d.; fennel (colic antispasmodic), tea 1 cup t.i.d., 600 mg caps t.i.d., for infants 2 tsp seeds t.i.d.; garlic (antispasmodic), up to 3 g b.i.d.; lemon balm; raspberry tea; sage (antispasmodic).	Oregon grape, yellow dock, wormwood.
Diet and Nutrition/Lifestyle	Lactase (for those with lactose intolerance); lipase (pancreatic insufficiency); fiber; food allergy: identify and eliminate if present; dairy and grain most common factors.	Charcoal (excess gas); lactobacillus acidophilus; refined sugar: reduce amount in diet.	Proteolytic enzymes; vitamin A up to 25,000 IU/day; vitamin C 500 mg t.i.d.; vitamin E 100 IU t.i.d.; zinc 20 mg/day.
Mind-Body Interventions	Cognitive behavioral therapy; depression (functional bowel complaints), detect and treat; exercise; hypnotherapy; biofeedback; progressive muscle relaxation; psychotherapy; stress management.		
Alternative Systems of Care		Traditional Chinese medicine herbals; acupuncture; ayurveda.	Homeopathy: (follow label dosages) argentum nitricum; asa foetida; colocynthis; lillium tigrinum; lycopodium; natrum carbonicum; nux vomica; podophyllum; sulfur.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–21 Alternative Therapies for Musculoskeletal Problems

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Arnica ointment/gel (topical); tiger balm; white willow (salicylate); glucosamine, chondroitin	*Topical agents for wound and tissue healing, pain:* aescin (horse chestnut); aloe gel; angelica; calendula; comfrey; echinacea; Saint John's wort oil; tea tree; witch hazel; wintergreen oil; curcumin (anti-inflammatory)	*Tissue and wound healing:* cat's claw; gotu kola; aromatherapy: lavender, camphor, eucalyptus, chamomile, rosemary. *Athletic performance enhancement:* Asian ginseng, eleuthero; guarana.
Diet and Nutrition/Lifestyle	Stretching, conditioning, warm-up to prevent injuries; bioflavonoids: citrus 900–1800 mg/day (improves healing time of injuries); enzymes: bromelain 500 MCU q.i.d. (proteolytic, anti-inflammatory).	Calcium 800–1000 mg/day (bone, muscle injury); magnesium 300 mg t.i.d. (muscle spasm, injury); vitamin C 400–3000 mg/day (connective tissue support, muscle damage); vitamin E 400–1200 IU/day (muscle damage), topically for scars; eliminate food allergy (may worsen inflammation).	*Tissue/Wound Healing:* vitamin A; copper, manganese, silicon, zinc; chondroitin sulfate; glucosamine sulfate; arginine, glutamine, L-carnitine. *Bursitis:* vitamin B_{12} 1000 μg q.d. for 2–4 wk IM or subcutaneously. *Fibromyalgia:* vitamin B_1 10–100 mg/day; magnesium 300–600 mg/day; vitamin E 100–300 IU/day; D , L -phenylalanine 500–700 mg t.i.d. (for pain). *Enhancing athletic performance:* antioxidants, B complex vitamins, chromium, zinc, iron, magnesium, branched-chain amino acids, carnitine, pyruvate, whey protein, leucine, inosine, ornithine, ornithine alpha-ketoglutarate, glutamine, creatine, gamma oryzanol, medium-chain triglycerides.
Mind-Body Interventions	Regular exercise, stretching; tai chi; yoga.	Biofeedback; guided imagery; hypnosis; music therapy; qi gong; relaxation therapy; spiritual interventions.	

Alternative Therapies for Musculoskeletal Problems (Continued)

Therapy	*Best Evidence**	*Probably Useful†*	*Least Evidence‡*
Pharmacological and Biological Treatments			Hydrotherapy (add essential oils, Epsom salts); spa therapy; DMSO topically.
Bioelectromagnetic Therapies	TENS unit.	Energy medicine; healing touch; reiki; therapeutic touch.	Hyperbaric oxygen; light therapy; magnet therapy.
Alternative Systems of Care		Acupuncture; acupressure; traditional Chinese medicine: cupping; ayurveda: massage, oil, herbal techniques.	Homeopathy: *Broken bone support:* arnica 30C q 15–30 min for 2 hr, then t.i.d. for 2 days; *Ruta graveolens* 6C t.i.d. for 2–3 days. *Sprains and injuries:* arnica 30C t.i.d.–q.i.d. for 2–3 days; *Ruta graveolens* 6C t.i.d. for 2–3 days; Ledum 30C t.i.d. for 2-3 days. *Bursitis: Rhus toxicodendron* 6C t.i.d.–q.i.d. for 3–4 days; *Ruta graveolens* 6C t.i.d. for 3–4 days; belladonna 6C t.i.d.–q.i.d. for 1–2 days.
Hands-On Healing Techniques		Craniosacral; Feldenkrais; rolfing; trager.	Chiropractic; massage; osteopathy.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–22 Alternative Therapies for Upper Respiratory Infections

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals	Echinacea 3–5 ml tincture or juice t.i.d., 300–600 mg caps t.i.d., dried root or as tea 0.5–1.0 g t.i.d.	Garlic 300 mg (4000–5000 μg allicin) t.i.d., 1–4 cloves/day; goldenseal 4–6 g t.i.d.	*Immune support:* Asian ginseng, astragalus, eleuthero, schisandra. *Antiviral/antibiotic:* elderberry, horseradish, myrrh, usnea. *Symptomatic relief:* slippery elm, marshmallow, red raspberry, blackberry, blueberry, sage, yarrow, eucalyptus oil, meadowsweet.
Diet and Nutrition/Lifestyle	Avoid exhausting exercise; bedrest; drink large amounts of fluids.	Vitamin C 1–3 g/day; avoid dietary allergens; *Gargle:* salt water and vinegar; hot water with lemon juice and honey.	Zinc gluconate or gluconate-glycine lozenges 10/day until better; L-lysine 4–5 g/day initially, then 500 mg t.i.d. for cold sores, L-lysine cream; vitamin A 15,000–25,000 IU/day (unless pregnant); beta carotene 50,000–100,000 IU/day.
Mind-Body Interventions	Social support; stress management and awareness.		
Pharmacological and Biological Treatments	Control respiratory allergies with antihistamines, nasal steroids, avoidance of allergens.	Hyperthermia.	
Bioelectromagnetic Therapies			Energy medicine; hydrotherapy; magnet therapy.
Alternative Systems of Care		Ayurveda; traditional Chinese medicine; acupuncture; cupping.	Homeopathy: aconite 30C q 2 hrs for 3 doses only; kali bichromicum 6C t.i.d.–q.i.d. for 2–3 days; *Rhus toxicodendron* 6C q 2 hr up to 6 doses; euphrasia 6C q.i.d.
Hands-On Healing Techniques		Percussion.	

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.
SOURCE: Sierpina, VS: Integrative Health Care: Complementary and Alternative Therapies for the Whole Person, F.A. Davis, Philadelphia, 2000.

Appendix 2–23 Alternative Therapies for Urinary Tract Infections

Therapy	*Best Evidence* *	*Probably Useful* †	*Least Evidence* ‡
Herbals		Cranberry juice 0.5 L/day, 400 mg/b.i.d of extract; blueberry juice 0.25 L/day	Uva ursi 3–5 ml tincture, 100–250 mg t.i.d. (as arbutin in herbal extract) (requires alkaline urine—potassium or sodium citrate, .5 tsp sodium bicarbonate, Alka Seltzer); garlic 300 mg t.i.d., 1–4 cloves/day; goldenseal 250–300 mg t.i.d. std extract, 3–4 g/day root caps, tabs, tincture; sandalwood oil 1–2 drops t.i.d.; *herbal diuretic teas:* asparagus, birch, couch grass, horsetail, Java tea, juniper lovage, spiny restharrow, nettle, parsley: 1–3 tsp (5–15 g) steeped for 15 min and taken t.i.d.
Diet and Nutrition/Lifestyle	Drink large amounts of low-sugar juices, water, other fluids (>2 L/day); urinate after intercourse (women); eliminate obstruction.		Identify and eliminate food allergies in recurrent infections; vitamin C 5 g/day; vitamin A 25,000 IU/day; beta-carotene 200,000 IU/day; zinc 30 mg/day; bromelain; multivitamins.
Alternative Systems of Care		Ayurveda; traditional Chinese medicine.	Homeopathy: cantharis 30C t.i.d. for 2 days; sepia 30C t.i.d. for 2 days; belladonna 6C q 2 hr up to 6 doses; staphysagria 12C t.i.d. for 2 days; nux vomica q 2 hr up to 6 doses.

*Therapies with the highest degree of scientific support for efficacy and safety.
†Therapies that are often helpful but that do not have the highest degree of supporting evidence for efficacy and safety.
‡Therapies that may be useful but that have limited scientific evidence for efficacy and safety.
NOTE: C denotes the number of times that a substance is diluted at a ratio of 1:100.

APPENDIX 3
Normal Reference Laboratory Values

BLOOD, PLASMA, OR SERUM VALUES

Determination	*Reference Range*		*Minimal ml Required **	*Note*
	Conventional	*SI*		
Acetoacetate plus acetone	Negative		1-B	
Aldolase	1.3–8.2 U/L	22–137 nmol · sec^{-1}/L	2-S	Use unhemolyzed serum
Ammonia	12–55 μmol/L	12–55 μmol/L	2-B	Collect in heparinized tube; deliver *immediately* packed in ice
Amylase	4–25 units/ml	4–25 arb. unit	1-S	
Ascorbic acid	0.4–1.5 mg/100 ml	23–85 μmol/L	7-B	Collect in heparinized tube before any food is given
Bilirubin	Direct: up to 0.4 mg/100 ml Total: up to 1.0 mg/100 ml	Up to 7 μmol/L Up to 17 μmol/L	1-S	
Blood volume	8.5–9.0% of body weight in kg	80–85 ml/kg		
CA-125	<20 U/ml	<20 kU/L	5	Collect in plain red top tube
Calcium	8.5–10.5 mg/100 ml (slightly higher in children)	2.1–2.6 mmol/L	1-S	
Carbamazepine	4.0–12.0 μg/ml	17–51 μmol/L		
Carbon dioxide content	24–30 mEq/L	24–30 mmol/L	1-S	Fill tube to top
Carbon monoxide	<5% of total hemoglobin		3-B	Fill tube to top
Carcinoembryonic antigen	0.0–2.5 ng/ml	0.0–2.5 μg/L	0.5	Collect in plain red top tube
Carotenoids	0.8–4.0 μg/ml	1.5–7.4 μmol/L	3-S	Vitamin A may be done on same specimen
Ceruloplasmin	27–37 mg/100 ml	1.8–2.5 μmol/L	2-S	
Chloramphenicol	10–20 μg/ml	31–62 μmol/L	0.2-S	
Chloride	100–106 mEq/L	100–106 mmol/L	1-S	
CK isoenzymes	5% MB or less		0.2-S	
Copper	Total: 100–200 μg/100 ml	16–31 μmol/L	1-S	
C reactive protein	0–1.0 mg/dl	0–10 mg/L	0.5	Collect in serum separator tube or heparinized plasma

BLOOD, PLASMA, OR SERUM VALUES (Continued)

Determination	Reference Range		*Minimal ml Required**	*Note*
	Conventional	*SI*		
Creatine kinase (CK)	Female: 10–79 U/L Male: 17–148 U/L	167–1317 nmol · sec^{-1} /L 283–2467 nmol · sec^{-1} /L	1-S	
Creatinine	0.6–1.5 mg/100 ml	53–133 μmol/L	1-S	
Ethanol	0 mg/100 ml	0 mmol/L	2-B	Collect in oxalate and refrigerate
Glucose	Fasting: 70–110 mg/100 ml	3.9–5.6 mmol/L	1-P	Collect with oxalate-fluoride mixture
Iron	50–150 μg/100 ml (higher in males)	9.0–26.9 μmol/L	1-S	
Iron-binding capacity	250–410 μg/100 ml	44.8–73.4 μmol/L	1-S	
Lactic acid	0.6–1.8 mEq/L	0.6–1.8 mmol/L	2-B	Collect with oxalate-fluoride mixture; deliver immediately packed in ice
Lactic dehydrogenase	45–90 U/L	750–1500 nmol · sec^{-1} /L	1-S	Unsuitable if hemolyzed
Lead	50 μg/100 ml or less	Up to 2.4 μmol/L	2-B	Collect with oxalate-fluoride mixture
Lipase	2 units/ml or less	Up to 2 arb. unit	1-S	
Lipids				
Cholesterol	<200 mg/dl	<5.18 mmol/L	1-S	Fasting
Triglycerides	40–150 mg/100 ml	0.4–1.5 g/L	1-S	Fasting
Lipoprotein electrophoresis (LEP)			2-S	Fasting, do not freeze serum
Lithium	0.6–1.2 mEq/L	0.6–1.2 nmol/L	1-S	
Magnesium	1.5–2.0 mEq/L	0.8–1.3 mmol/L	1-S	
5′ Nucleotidase	1–11 U/L	17–183 nmol · sec^{-1}/L	1-S	
Osmolality	280–296 mOsm/kg water	280–296 mmol/kg	1-S	
Oxygen saturation (arterial)	96–100%	0.96–1.00	3-B	Deliver in sealed heparinized syringe packed in ice
P_{CO_2}	35–45 mm Hg	4.7–6.0 kPa	2-B	Collect and deliver in sealed heparinized syringe

pH	7.35–7.45	Same	2-B	Collect without stasis in sealed heparinized syringe; deliver packed in ice
P_{O_2}	75–100 mm Hg (dependent on age) while breathing room air Above 500 mm Hg while on 100% O_2	10.0–13.3 kPa	2-B	
Phenobarbital	15–50 μg/ml	65–215 μmol/L	1-S	
Phenytoin (Dilantin)	10–20 μg/ml	20–80 μmol/L	1-S	
Phosphatase (acid)	Male–Total: 0.13–0.63 sigma U/ml Female–Total: 0.01–0.56 sigma U/ml Prostatic: 0–0.05 Fishman-Lerner U/100 ml	36–175 nmol · sec^{-1}/L 2.8–156 nmol · sec^{-1}/L	1-S	Must always be drawn just before analysis or stored as frozen serum; avoid hemolysis
Phosphatase (alkaline)	13–39 U/L, infants and adolescents up to 104 U/L	217–650 nmol · sec^{-1}/L, up to 1.26 μmol/L	1-S	
Phosphorus (inorganic)	3.0–4.5 mg/100 ml (infants in first year up to 6.0 mg/100 ml)	1.0–1.5 mmol/L	1-S	
Potassium	3.5–5.0 mEq/L	3.5–5.0 mmol/L	1-S	Serum must be separated promptly from cells
Primidone (Mysoline)	4–12 μg/ml	18–55 μmol/L	1-S	
Procainamide	4–10 μg/ml	17–42 μmol/L	1-S	
Prostate-specific antigen	<4.0 ng/ml	<4.0 μ/L	2	Serum separator or EDTA plasma
Protein: Total	6.0–8.4 g/100 ml	60–84 g/L	1-S	
Albumin	3.5–5.0 g/100 ml	35–50 g/L	1-S	
Globulin	2.3–3.5 g/100 ml	23–35 g/L		Globulin equals total protein minus albumin
Electrophoresis	(% of total protein)		1-S	Quantitation by densitometry
Albumin	52–68			
Globulin:				
$Alpha_1$	4.2–7.2			
$Alpha_2$	6.8–12			

BLOOD, PLASMA, OR SERUM VALUES (Continued)

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
Beta	9.3–15			
Gamma	13–23			
Pyruvic acid	0–0.11 mEq/L	0–0.11 mmol/L	2-B	Collect with oxalate fluoride. Deliver immediately packed in ice
Quinidine	1.2–4.0 μg/ml	3.7–12.3 μmol/L	1-S	
Salicylate:	0		2-P	
Therapeutic	20–25 mg/100 ml; 25–30 mg/100 ml to age 10 yr 3 hr post dose	1.4–1.8 mmol/L 1.8–2.2 mmol/L		
Sodium	135–145 mEq/L	135–145 mmol/L	1-S	
Sulfonamide	5–15 mg/100 ml		2-P	
Transaminase, aspartate aminotransferase	7–27 U/L	117–450 nmol · sec^{-1}/L	1-S	
Transaminase, alanine aminotransferase	1–21 U/L	17–350 nmol · sec^{-1}/L	1-S	
Troponin-I	0–0.5 ng/ml	0–0.5 μg/L	0.6	Collect in light green top tube
Troponin-T	0–0.5 ng/ml		0.6	Collect in light green top tube
Urea nitrogen (BUN)	8–25 mg/100 ml	2.9–8.9 mmol/L	1-S	
Uric acid	3.0–7.0 mg/100 ml	0.18–0.42 mmol/L	1-S	
Vitamin A	0.15–0.6 μg/ml	0.5–2.1 μmol/L	3-S	

URINE VALUES

Determination	Reference Range		Minimal ml Required *	Note
	Conventional	SI		
Acetone plus acetoacetate (quantitative)	0	0 mg/L	2 ml	
Amylase	24–76 units/ml	24–76 arb. unit		
Calcium	300 mg/day or less	7.5 mmol/day or less	24-hr specimen	Collect in special bottle with 10 ml of concentrated HCl
Catecholamines	Epinephrine: under 20 μg/day	<109 nmol/day	24-hr specimen	Should be collected with 10 ml of concentrated HCl (pH should be between 2.0 and 3.0)
	Norepinephrine: under 100 μg/day	<590 nmol/day		
Chorionic gonadotropin	0	0 arb. unit	1st morning void	
Copper	0–100 μg/day	0–1.6 μmol/day	24-hr specimen	
Coproporphyrin	50–250 μg/day	80–380 nmol/day	24-hr specimen	Collect with 5 g of sodium carbonate
	Children under 80 lb (36 kg): 0–75 μg/day	0–115 nmol/day		
Creatine	Under 100 mg/day or less than 6% of creatinine. In pregnancy: up to 12%. In children under 1 yr: may equal creatinine. In older children: up to 30% of creatinine.	<0.75 mmol/day	24-hr specimen	Also order creatinine
Creatinine	15–25 mg/kg of body weight/day	0.13–0.22 mmol · kg^{-1}/day	24-hr specimen	
Cystine or cysteine	0	0	10 ml	Qualitative
Hemoglobin and myoglobin	0		Freshly voided sample	Chemical examination with benzidine
5–Hydroxyindoleacetic acid	2–9 mg/day (women lower than men)	10–45 μmol/day	24-hr specimen	Collect with 10 ml of concentrated HCl

URINE VALUES (Continued)

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
Lead	0.08 μg/ml or 120 μg/day or less	0.39 μmol/L or less	24-hr specimen	
Phosphorus (inorganic)	Varies with intake; average, 1 g/day	32 mmol/day	24-hr specimen	Collect with 10 ml of concentrated HCl
Porphobilinogen	0	0	10 ml	Use freshly voided urine
Protein:				
Quantitative	<150 mg/24 hr	<0.15 g/day	24-hr specimen	
Steroids:				
17–Ketosteroids (per day)	Age Male Female 10 1–4 mg 1–4 mg 20 6–21 4–16 30 8–26 4–14 50 5–18 3–9 70 2–10 1–7	3–14 μmol 3–14 μmol 21–73 14–56 28–90 14–49 17–62 10–31 7–35 3–24	24-hr specimen	
17–Hydroxysteroids	3–8 mg/day (women lower than men)	8–22 μmol/day as tetrahydrocortisol	24-hr specimen	Keep cold; chlorpromazine and related drugs interfere with assay
Sugar:				
Quantitative glucose	0	0 mmol/L	24-hr or other timed specimen	
Urobilinogen	Up to 1.0 Ehrlich U	To 1.0 arb. unit	2-hr sample (1–3 P.M.)	
Uroporphyrin	0–30 μg/day	<36 nmol/day	SEE: Coproporphyrin	
Vanillylmandelic acid (VMA)	Up to 9 mg/24 hr	Up to 45 μmol/day	24-hr specimen	Collect as for catecholamines

Steroid Hormones

Determination	*Reference Range*		*Minimal ml Required **	*Note*
	Conventional	*SI*		
Aldosterone	Excretion: 5–19 μg/24 hr	14–53 nmol/day	5/day	Keep specimen cold
	Supine: 48±29 pg/ml	133±80 pmol/L	3-S, P	Fasting, at rest, 210-mEq sodium diet
	Upright (2 hr): 65±23 pg/ml	180±64 pmol/L		Upright, 2 hr, 210-mEq sodium diet
	Supine: 107±45 pg/ml	279±125 pmol/L		Fasting, at rest, 110-mEq sodium diet
	Upright (2 hr): 239±123 pg/ml	663±341 pmol/L		Upright, 2 hr, 110-mEq sodium diet
	Supine: 175±75 pg/ml	485±208 pmol/L		Fasting, at rest, 10-mEq sodium diet
	Upright (2 hr): 532±228 pg/ml	1476±632 pmol/L		Upright, 2 hr, 10-mEq sodium diet
Cortisol	8 A.M. : 5–25 μg/100 ml	0.14–0.69 μmol/L	1-P	Fasting
	8 P.M. : Below 10 μg/100 ml	0–0.28 μmol/L	1-P	At rest
	4-hr ACTH test: 30–45 μg/100 ml	0.83–1.24 μmol/L	1-P	20 U ACTH, IV per 4 hr

SPECIAL ENDOCRINE TESTS (Continued)

Steroid Hormones

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
	Overnight suppression test: Below 5 μg/100 ml	0.14 nmol/L	1-P	8 A.M. sample after 0.5 mg dexamethasone by mouth at midnight
	Excretion: 20–70 μg/24 hr	55–193 nmol/day	2/day	Keep specimen cold
Dehydroepiandrosterone (DHEA)	Male: 0.5–5.5 ng/ml	1.7–19 nmol/L	2-S, P	
	Female 1.4–8.0 ng/ml	4.9–28 nmol/L		Adult
	0.3–4.5 ng/ml	1.0–15.6 nmol/L		Postmenopausal
Dehydroepiandrosterone sulfate (DHEA–S)	Male 151–446 μg/100 ml	3.9–11.4 μgmol/L	2-S, P	
	Female 84–433 μg/100 ml	2.2–11.1 μmol/L		Adult
	1.7–177 μg/100 ml	0.04–4.5 μmol/L		Postmenopausal
11–Deoxycortisol	Responsive Over 7.5 μg/100 ml	>0.22 μmol/L	1-P	8 A.M. sample, preceded by 4.5 g of metyrapone by mouth per 24 hr or by single dose of 2.5 g by mouth at midnight
Estradiol	Male: <50 pg/ml	<184 pmol/L	5-S, P	
	Female: 23–361 pg/ml	84–1325 pmol/L		Adult
	<30 pg/ml	<110 pmol/L		Postmenopausal
	<20 pg/ml	<73 pmol/L		Prepubertal
Progesterone	Male: <1.0 ng/ml	<3.2 nmol/L	5-S, P	
	Female 0.2–0.6 ng/ml	0.6–1.9 nmol/L		Follicular phase
	0.3–3.5 ng/ml	0.95–11 nmol/L		Midcycle peak
	6.5–32.2 ng/ml	21–102 nmol/L		Postovulatory
Testosterone	Adult male: 300–1100 ng/100 ml	10.4–38.1 nmol/L	1-P	A.M. sample

Unbound testosterone	Adolescent male: Over 100 ng/100 ml Female 25–90 ng/100 ml Adult male: 3.06–24.0 ng/100 ml Adult female: 0.09–1.28 ng/100 ml	 >3.5 nmol/L 0.87–3.12 nmol/L 106–832 pmol/L 3.1–44.4 pmol/L	2-P	A.M. sample

Polypeptide Hormones

Determination	*Reference Range*		*Minimal ml Required **	*Note*
	Conventional	*SI*		
Adrenocorticotropin (ACTH)	15–70 pg/ml	3.3–15.4 pmol/L	5-P	Place specimen on ice and send promptly to laboratory. Use EDTA tube only.
Alpha subunit	<0.5–2.5 ng/ml <0.5–5.0 ng/ml	<0.4–2.0 nmol/L <0.4–4.0 nmol/L	2-S	Adult male or female Postmenopausal female
Calcitonin	Male: 0–14 pg/ml Female: 0–28 pg/ml >100 pg/ml in medullary carcinoma	0–4.1 pmol/L 0–8.2 pmol/L >29.3 pmol/L	5-S	Test done only on known or suspected cases of medullary carcinoma of the thyroid
Follicle-stimulating hormone (FSH)	Male: 3–18 mU/ml	3–18 arb. unit	5-S, P	Same sample may be used for LH
	Female: 4.6–22.4 mU/ml 13–41 mU/ml 30–170 mU/ml	4.6–22.4 arb. unit 13–41 arb. unit 30–170 arb. unit		Pre- or postovulatory Midcycle peak Postmenopausal

SPECIAL ENDOCRINE TESTS (Continued)

Polypeptide Hormones

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
Growth hormone	Below 5 ng/ml	<233 pmol/L	1-S	Fasting, at rest
	Children: Over 10 ng/ml	>465 pmol/L		After exercise
	Male: Below 5 ng/ml	<233 pmol/L		
	Female: Up to 30 ng/ml	0–1395 pmol/L		
	Male: Below 5 ng/ml	<233 pmol/L		After glucose load
	Female: Below 5 ng/ml	<233 pmol/L		
Insulin	6–26 μU/ml	43–187 pmol/L	1-S	Fasting
	Below 20 μU/ml	<144 pmol/L		During hypoglycemia
	Up to 150 μU/ml	0–1078 pmol/L		After glucose load
Luteinizing hormone (LH)	Male: 3–18 mU/ml	3–18 arb. unit	5-S, P	Same sample may be used for FSH
	Female:			
	2.4–34.5 mU/ml	2.4–34.5 arb. unit		Pre- or postovulatory
	43–187 mU/ml	43–187 arb. unit		Midcycle peak
	30–150 mU/ml	30–150 arb. unit		Postmenopausal
Parathyroid hormone	<25 pg/ml	<2.94 pmol/L	5-P	Keep blood on ice, or plasma frozen, if it is to be sent any distance; A.M. sample
Prolactin	2–15 ng/ml	0.08–6.0 nmol/L	2-S	
Renin activity	Supine:		4-P	EDTA tubes, on ice, normal diet
	1.1±0.8 ng/ml/hr	0.9±0.6 nmol/L/hr		
	Upright:			
	1.9±1.7 ng/ml/hr	1.5±1.3 nmol/L/hr		
	Supine:			Low-sodium diet
	2.7±1.8 ng/ml/hr	2.1±1.4 nmol/L/hr		
	Upright:			
	6.6±2.5 ng/ml/hr	5.1±1.9 nmol/L/hr		
	Diuretics:			Low-sodium diet
	10.0±3.7 ng/ml/hr	7.7±2.9 nmol/L/hr		

Somatomedin C (Sm–C, IGF–1)	0.08–2.8 U/ml 0.9–5.9 U/ml 0.34–1.9 U/ml 0.45–2.2 U/ml	0.08–2.8 arb. unit 0.9–5.9 arb. unit 0.34–1.9 arb. unit 0.45–2.2 arb. unit	2-P	EDTA plasma prepubertal During puberty Adult males Adult females

Thyroid Hormones

Determination	*Reference Range*		*Minimal ml Required **	*Note*
	Conventional	*SI*		
Thyroid-stimulating hormone (TSH)	0.5–5.0 μU/ml	0.5–5.0 arb. unit	2-S	
Thyroxine-binding globulin capacity	15–25 μg T_4/100 ml	193–322 nmol/L	2-S	
Total triiodothyronine (T_3)	75–195 ng/100 ml	1.16–3.00 nmol/L	2-S	
Reverse triiodothyronine (rT_3)	13–53 ng/ml	0.2–0.8 nmol/L	2-S	
Total thyroxine by RIA (T_4)	4–12 μg/100 ml	52–154 nmol/L	1-S	
T_3 resin uptake	25–35%	0.25–0.35	2-S	
Free thyroxine index (FT_4 I)	1–4		2-S	

VITAMIN D DERIVATIVES

Determination	*Reference Range*		*Minimal ml Required **	*Note*
	Conventional	*SI*		
1,25-Dihydroxy–vitamin D	26–65 pg/ml	62–155 pmol/L	1-S	
25-Hydroxy–vitamin D	8–55 ng/ml	19.4–137 nmol/L	1-S	

HEMATOLOGIC VALUES

Determination	Reference Range: Conventional	Reference Range: SI	Minimal ml Required *	Note
Coagulation factors				
Factor I (fibrinogen)	0.15–0.35 g/100 ml	4.0–10.0 μmol/L	4.5-P	Collect in Vacutainer containing sodium citrate
Factor II (prothrombin)	60–140%	0.60–1.40	4.5-P	Collect in plastic tubes with 3.8% sodium citrate
Factor V (accelerator globulin)	60–140%	0.60–1.40	4.5-P	Collect as in factor II
Factor VII–X (proconvertin-Stuart)	70–130%	0.70–1.30	4.5-P	Collect as in factor II
Factor X (Stuart factor)	70–130%	0.70–1.30	4.5-P	Collect as in factor II
Factor VIII (antihemophilic globulin)	50–200%	0.50–2.0	4.5-P	Collect as in factor II
Factor IX (plasma thromboplastic cofactor)	60–140%	0.60–1.40	4.5-P	Collect as in factor II
Factor XI (plasma thromboplastic antecedent)	60–140%	0.60–1.40	4.5-P	Collect as in factor II
Factor XII (Hageman factor)	60–140%	0.60–1.40	4.5-P	Collect as in factor II
Coagulation screening tests:				
Bleeding time (Simplate)	3–9.5 min	180–570 sec		
D-dimer	<500 ng/ml	<500 μg/L	4.5 ml	Collect in 3.8% sodium citrate
Prothrombin time	Less than 2-sec deviation from control	Less than 2-sec deviation from control	4.5-P	Collect in Vacutainer containing 3.8% sodium citrate
International Normalized Ratio (INR)	1.0	1.0	4.5 ml	Collect in 3.8% sodium citrate
Partial thromboplastin time (activated)	25–38 sec	25–38 sec	4.5-P	Collect in Vacutainer containing 3.8% sodium citrate
Whole-blood clot lysis	No clot lysis in 24 hr	0/day	2.0-whole blood	Collect in sterile tube and incubate at 37°C

Fibrinolytic studies:				
Euglobin lysis	No lysis in 2 hr	0/2 hr	4.5-P	Collect as in factor II
Fibrinogen split products	Negative reaction at >1:4 dilution	0 (at 1:4 dilution)	4.5-S	Collect in special tube containing thrombin and epsilon aminocaproic acid
Thrombin time	Control ±5 sec	Control ± 5 sec	4.5-P	Collect as in factor II
"Complete" blood count:				
Hematocrit	Male: 45–52% Female: 37–48%	Male: 0.45–0.52 Female: 0.37–0.48	1-B	Use EDTA as anticoagulant; the seven listed tests are performed automatically on the Ortho ELT 800, which directly determines cell counts, hemoglobin (as the cyanmethemoglobin derivative), and MCV and computes hematocrit, MCH, and MCHC
Hemoglobin	Male: 13–18 g/100 ml Female: 12–16 g/100 ml	Male: 8.1–11.2 mmol/L Female: 7.4–9.9 mmol/L		
Leukocyte count	4,300–10,800/mm^3	4.3–10.8 × 10^9/L		
Erythrocyte count	4.2–5.9 million/mm^3	4.2–5.9 × 10^{12}/L		
Mean corpuscular volume (MCV)	86–98 μm^3/cell	86–98 fl		
Mean corpuscular hemoglobin (MCH)	27–32 pg/RBC	1.7–2.0 pg/cell		
Mean corpuscular hemoglobin concentration (MCHC)	32–36%	0.32–0.36		
Erythrocyte sedimentation rate	Male: 1–13 mm/hr Female: 1–20 mm/hr	Male: 1–13 mm/hr Female: 1–20 mm/hr	5-B	Use EDTA as anticoagulant
Erythrocyte enzymes				
Glucose-6-phosphate dehydrogenase	5–15 U/g Hb	5–15 U/g	9-B	Use special anticoagulant (ACD solution)
Pyruvate kinase	13–17 U/g Hb	13–17 U/g	8-B	Use special anticoagulant (ACD solution)
Ferritin (serum)				
Iron deficiency	0–12 ng/ml 13–20 Borderline	0–4.8 nmol/L 5.2–8 nmol/L Borderline		
Iron excess	>400 ng/L	>160 nmol/L		
Folic acid				
Normal	>3.3 ng/ml	>7.3 nmol/L	1-S	
Borderline	2.5–3.2 ng/ml	5.75–7.39 nmol/L	1-S	
Haptoglobin	40–336 mg/100 ml	0.4–3.36 g/L	1-S	

HEMATOLOGIC VALUES (Continued)

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
Hemoglobin studies:				
Electrophoresis for abnormal hemoglobin			5-B	Collect with anticoagulant
Electrophoresis for:			5-B	Use oxalate as anticoagulant
A_2 hemoglobin	3.0%	0.015–0.035		
Borderline	0.3–3.5%	0.03–0.035		
Hemoglobin F (fetal hemoglobin)	Less than 2%	<0.02	5-B	Collect with anticoagulant
Hemoglobin, met- and sulf-	0	0	5-B	Use heparin as anticoagulant
Serum hemoglobin	2–3 mg/100 ml	1.2–1.9 μmol/L	2-S	
Thermolabile hemoglobin	0	0	1-B	Any anticoagulant
Lupus anticoagulant	0	0	4.5-P	Collect as in factor II
LE (lupus erythematosus) preparation:				
Method I	0	0	5-B	Use heparin as anticoagulant
Method II	0	0	5-B	Use defibrinated blood
Leukocyte alkaline phosphatase:			20-Isolated blood leukocytes	Special handling of blood necessary
Qualitative method	Males: 33–188 U Females (off contraceptive pill): 30–160 U	33–188 U 30–160 U	Smear-B	
Muramidase	Serum, 3–7 μg/ml	3–7 mg/L	1-S	
	Urine, 0–2 μg/ml	0–2 μg/L	1-U	
Osmotic fragility of erythrocytes	Increased if hemolysis occurs in over 0.5% NaCl; decreased if hemolysis is incomplete in 0.3% NaCl		5-B	Use heparin as anticoagulant
Peroxide hemolysis	Less than 10%	0.10	6-B	Use EDTA as anticoagulant

Platelet count	150,000–350,000/mm^3	150–350 x 10^9/L	0.5-B	Use EDTA as anticoagulant; counts are performed on Clay Adams Ultraflow; when counts are low, results are confirmed by hand counting
Platelet function tests:				
Clot retraction	50–100%/2 hr	0.50–1.00/2 hr	4.5-P	Collect as in factor II
Platelet aggregation	Full response to ADP, epinephrine, and collagen	1.0	18-P	Collect as in factor II
Platelet factor 3	33–57 sec	33–57 sec	4.5-P	Collect as in factor II
Reticulocyte count	0.5–2.5% red cells	0.005–0.025	0.1-B	
Vitamin B_{12}	205–876 pg/ml	150–674 pmol/L	12-S	
Borderline	140–204 pg/ml	102.6–149 pmol/L

Carcinoembryonic antigen (CEA)	0–2.5 ng/ml	0–2.5 μg/L	20-P	Must be sent on ice
Chylous fluid				Use fresh specimen
Digitoxin	17±6 ng/ml	22±7.8 nmol/L	1-S	
Digoxin	1.2±0.4 ng/ml	1.54±0.5 nmol/L	1-S	
	1.5±0.4 ng/ml	1.92±0.5 nmol/L	1-S	
Duodenal drainage				pH should be in proper range with minimal amount of gastric juice
pH (urine)	5–7	5–7		
Gastric analysis	Basal:			
Females: 2.0±1.8 mEq/hr		0.6±0.5 μmol/sec		
Males: 3.0±2.0 mEq/hr		0.8±0.6 μmol/sec		
Maximal (after histalog or gastrin)				
Females: 16±5 mEq/hr		4.4±1.4 μmol/sec		
Males: 23±5 mEq/hr		6.4±1.4 μmol/sec		
Gastrin-I	0–200 pg/ml	0–95 pmol/L	4-P	Heparinized sample
Immunologic tests:				
Alpha-fetoprotein	Undetectable in normal adults		2-S	
Alpha-1-antitrypsin	85–213 mg/100 ml	0.85–2.13 g/L	10-B	
Rheumatoid factor	<60 IU/ml		10 ml clotted blood	Fasting sample preferred
Antinuclear antibodies	Negative at a 1:8 dilution of serum		2-S	Send to laboratory promptly
Anti-DNA antibodies	Negative at a 1:10 dilution of serum		2-S	
Antibodies to Sm and RNP (ENA)	None detected		10 ml clotted blood	

Antibodies to SS-A (Ro) and SS-B (La)	None detected		10 ml clotted blood	
Autoantibodies to:				
Thyroid colloid and microsomal antigens	Negative at a 1:10 dilution of serum		2-S	Low titers in some elderly normal women
Gastric parietal cells	Negative at a 1:20 dilution of serum		2-S	
Smooth muscle	Negative at a 1:20 dilution of serum		2-S	
Mitochondria	Negative at a 1:20 dilution of serum		2-S	
Interstitial cells of the testes	Negative at a 1:10 dilution of serum		2-S	
Skeletal muscle	Negative at a 1:60 dilution of serum		2-S	
Adrenal gland	Negative at a 1:10 dilution of serum		2-S	
Bence Jones protein	No Bence Jones protein detected in a 50-fold concentrate of urine		50-U	
Complement, total hemolytic	150–250 U/ml		10-B	Must be sent on ice
Cryoprecipitable proteins	None detected	0 arb. unit	10-S	Collect and transport at 37°C
C3	Range, 83–177 mg/100 ml	0.83–1.77 g/L	2-S	
C4	Range, 15–45 mg/100 ml	0.15–0.45 g/L	2-S	
Factor B	12–30 mg/100 ml		5 ml clotted blood	
C1 esterase inhibitor	13.2–24 mg/100 ml		5 ml clotted blood	
Hemoglobin A_{1e}	3.8–6.4%	0.038–0.064	5-P	Send EDTA tube on ice promptly to laboratory
Hypersensitivity pneumonitis screen	No antibodies to those antigens assayed		5 ml clotted blood	
Immunoglobulins:				
IgG	639–1349 mg/100 ml	6.39–13.49 g/L	2-S	
IgA	70–312 mg/100 ml	0.7–3.12 g/L	2-S	
IgM	86–352 mg/100 ml	0.86–3.52 g/L	2-S	

MISCELLANEOUS VALUES (Continued)

Determination	Reference Range *Conventional*	Reference Range *SI*	*Minimal ml Required**	*Note*
Viscosity	1.4–1.8 relative viscosity units		10-B	Expressed as the relative viscosity of serum compared with water
Iontophoresis	Children: 0–40 mEq sodium/L Adults 0–60 mEq sodium/L	0–40 mmol/L 0–60 mmol/L		Value given in terms of sodium
Propranolol (includes bioactive 4-OH metabolite)	100–300 ng/ml	386–1158 nmol/L	1-S	Obtain blood sample 4 hr after last dose of beta-blocking agent
Stool fat	Less than 5 g in 24 hr or less than 4.0% of measured fat intake in 3-day period	<5 g/day	24-hr or 3-day specimen	
Stool nitrogen	Less than 2 g/day or 10% of urinary nitrogen	<2 g/day	24-hr or 3-day specimen	
Synovial fluid: Glucose	Not less than 20 mg/100 ml lower than simultaneously drawn blood sugar	SEE: *Blood glucose*	ml of fresh fluid	Collect with oxalate-fluoride mixture
D -Xylose absorption	5–8 g/5 hr in urine; 40 mg per 100 ml in blood 2 hr after ingestion of 25 g of D-xylose	33–53 mmol/day 2.7 mmol/L	5-U 5-B	For directions see Benson et al.: N Engl J Med 256:335, 1957

* Abbreviations used: SI, Système International d'Unités; P, plasma; S, serum; B, blood; and U, urine.

APPENDIX 4

Prefixes, Suffixes, and Combining Forms

a-, an-. Without; away from; not.
ab-, abs-. From; away from; absent.
abdomin-, abdomino-. Abdomen.
abort-, aborto-. To miscarry.
abs-. SEE: *ab-*.
acanth-, acantho-. Thorn; spine.
acous-, acoust-, acousto-. Hearing.
acro-. Extremity; top; extreme point.
actin-, actino-. Ray; some form of radiation.
ad-. Adherence; increase; toward.
-ad. Toward; in the direction of.
aden-, adeno-. Gland.
adip-, adipo-. Fat.
adren-, adreno-. Adrenal glands.
adrenal-, adrenalo-. Adrenal glands.
-aemia. Blood.
aer-, aero-. Air or gas.
-aesthesia, aesthesio-. SEE: *-esthesia.*
af-. Toward.
-agogue. An agent that promotes the expulsion of a specific substance.
-agra. Sudden severe pain.
-al. Relating to (e.g., abdominal, intestinal). In chemistry, an aldehyde.
albumin-, albumino-. Albumin.
-algesia, -algia. Suffering; pain.
algi-. Pain.
all-. SEE: *allo-*.
allo-, all-. Other.
amb-, ambi-. Both; on both sides; around; about.
amph-, amphi-, ampho-. Both; on both sides; on all sides; double; around; about.
an-. SEE: *a-*.
ana-, an-. Up; against; back.
andro-. Man; male; masculine.
angi-, angio-. Blood or lymph vessels.
aniso-. Unequal; asymmetrical; dissimilar.
ankyl-, ankylo-. Crooked; bent; fusion or growing together of parts.
ante-. Before.
antero-. Anterior; front; before.
anthropo-. Human beings; human life.
ant-, anti-. Against.
antr-, antro-. Antrum.
apo-. From; derived from; separated from; opposed.
arch-, arche-, archi-. First; principal; beginning; original.
arteri-, arterio-. Artery.
arthr-, arthro-. Joint.
-ase. Enzyme.
-asis, -esis, -iasis, -isis, -sis. Condition; pathological state.
astro-. Star; star-shaped.
atelo-. Imperfect; incomplete.
ather-, athero-. Fatty plaque.
atmo-. Steam; vapor.
atreto-. Absence of an opening.
aut-, auto-. Self.
axio-. Axis; the long axis of a tooth.
axo-. Axis; axon.
azot-, azoto-. Nitrogenous compounds.
bacteri-, bacterio-. Bacteria; bacterium.
balan-, balano-. Glans clitoridis; glans penis.
bar-, baro-. Weight; pressure.
basi-, basio-. Base; foundation.
bi-, bis-. Two; double; twice.
bili-. Bile.
bio-. Life.
bis-. SEE: *bi-*.
blast-, -blast. Germ; bud; embryonic state of development.
blenn-, blenno-. Mucus.
blephar-, blepharo-. Eyelid.
brachio-. Arm.
brachy-. Short.
brady-. Slow.
brom-, bromo-. Bromine.
bronch-, bronchi-, broncho-. Airway.
bronchiol-, bronchiolo-. Bronchiole.
cac-, caci-, caco-. Bad; ill.
calc-, calco-. Calcium.
calcan-, calcaneo-. Calcaneum (heel bone).
carcin-, carcino-. Cancer.
cardi-, cardio-. Heart.
carpo-. Carpus.
cary-, caryo-. SEE: *kary-*.
cat-, cata-, cath-, kat-, kata-. Down; downward; destructive; against; according to.
cath-. SEE: *cat-*.
cel-, celo-. 1. Tumor; hernia. **2.** Cavity.
-cele. Tumor; swelling; hernia.
cent-. Hundred.
cephal-, cephalo-. Head.
cerebell-, cerebello-. Cerebellum.
cervic-, cervico-. Neck; the neck of an organ.
cheil-, cheilo-. SEE: *chil-*.
chem-, chemo-. Chemical; drug.
chil-, chilo-. Lip; lips.
chir-, chiro-. Hand.
chlor-, chloro-. Green.
chol-, chole-. Bile; gall.
cholangi-, cholangio-. Bile vessel.
cholecyst-, cholecysto-. Gallbladder.
choledoch-, choledocho-. Bile duct.
chondr-, chondro-. Cartilage.
chrom-, chromo-. Color.
-cide. Causing death.
cine-. Movement.
circum-. Around.
clavicul-, claviculo-. Clavicle.
-cle, -cule. Little (e.g., molecule, corpuscle).
cleid-, cleido-. Clavicle.
co-, com-, con-. Together.
colp-, colpo-. SEE: *kolp-*.
contra-. Against; opposite.
crani-, cranio-. Skull; cranium.

cry-, cryo-. Cold.
-cusia,-cusis. Hearing.
cyan-, cyano-. Blue.
cycl-, cyclo-. Circular; cyclical; ciliary body of the eye.
cyst-, cysto-, -cyst. Cyst; urinary bladder.
cyt-, cyto-, -cyte. Cell.
dacry-. Tears.
dactyl-, dactylo-. Finger; toe.
de-. From; down; not.
dec-, deca-. Ten.
deci-. One tenth.
demi-. Half.
dent-, denti-, dento-. Teeth.
derm-, derma-, dermato-, dermo-. Skin.
deuter-, deutero-, deuto-. Second; secondary.
dextro-. Right.
di-. Double; twice; two; apart from.
dia-. Through; between; asunder.
dipla-, diplo-. Double; twin.
dips-, dipso-. Thirst.
dis-. Negative; double; twice; apart; absence of.
dors-, dorsi-, dorso-. Back.
duoden-, duodeno-. Duodenum.
-dynia. Pain.
dys-. Difficult; bad; painful.
-eal. Pertaining to.
ec-, ecto-. Out; on the outside.
-ectomy. Excision.
ectro-. Congenital absence of a part.
ef-, es-, ex-, exo-. Out.
electr-, electro-. Electricity.
embol-, embolo-. Plug.
-emesis. Vomiting.
-emia. Blood.
en-. In; into.
enantio-. Opposite.
end-, endo-. Within.
ent-, ento-. Within; inside.
enter-, entero-. Intestine.
ep-, epi-. Upon; over; at; in addition to; after.
episi-, episio-. Vulva.
erythr-, erythro-. Red.
eschar-, escharo-. Scab.
-esis. SEE: *-asis.*
esophag-, esophago-. Esophagus.
-esthesia. Sensation.
etio-. Causation.
eu-. Well; good; healthy; normal.
eury-. Broad.
ex-. Out; away from; completely.
exo-. Out; outside of; without.
extra-. Outside of; in addition; beyond.
-facient. Causing; making happen.
femor-, femoro-. Thigh.
-ferous. Producing.
ferri-, ferro-. Iron.
fibro-. Fibers; fibrous tissues.
fluo-. Flow.
fluor-, fluoro-. Luminous; fluorescence.
fore-. Before; in front of.
-form. Form.
-fuge. To expel; to drive away; fleeing.
galact-, galacto-. Milk.
gam-, gamo-. Marriage; sexual union.
gaster-, gastero-, gastr-, gastro-. Stomach.
gen-. Producing; forming.
-gen, -gene, -genesis, -genetic, -genic. Producing; forming.
glauc-, glauco-. Gray.
genito-. Organs of reproduction.
gero-. Old age.
giga-. Billion.
gingiv-, gingivo-. Gums (of the mouth).
-globin. Protein.
gloss-, glosso-. Tongue.
gluc-, gluco-, glyc-, glyco-. Sugar; glycerol or similar substance.
gnath-, gnatho-. Jaw; cheek.
-gog, -gogue. To make flow.
gon-, gono-. Semen; seed; genitals; offspring.
-gram. A tracing; a mark.
-graph. Instrument used to make a drawing or record.
-graphy. Writing; record.
-gravida. Pregnant.
gyn-, gyne-, gyneco-, gyno-. Woman; female.
gyro-. Circle; spiral; ring.
hem-, hema-, hemato-, hemo-. Blood.
hemi-. Half.
hepat-, hepato-. Liver.
heredo-. Heredity.
heter-, hetero-. Other; different.
hex-, hexa-. Six.
histo-. Tissue.
hol-, holo-. Complete; entire; homogeneous.
homeo-. Likeness; resemblance; constant unchanging state.
homo-. Same; likeness.
hydra-, hydro-, hydr-. Water.
hyo-. Hyoid bone.
hyp-, hyph-, hypo-. Less than; below or under; beneath; deficient.
hyper-. Above; excessive; beyond.
hypno-. Sleep; hypnosis.
hyster-, hystero-. Uterus.
-ia. Condition, esp. an abnormal state.
-iasis. SEE: *asis.*
-iatric. Medicine; medical profession; physicians.
-ic. Pertaining to; relating to.
ichthyo-. Fish.
-id. Secondary skin eruption distant from primary infection site.
ideo-. Mental images.
idio-. Individual; distinct.
ileo-. Ileum.
ilio-. Ilium; flank.
im-. SEE: *in-.* Used before b, m, or p.
immun-, immuno-. Immune; immunity.
in-. In; inside; within; intensive action; negative.
infra-. Below; under; beneath; inferior to; after.
inter-. Between; in the midst.
intra-, intro-. Within; in; into.
ipsi-. Same; self.
irid-, irido-. Iris.

ischio-. Ischium.
-isis. SEE: *-asis*.
-ism. Condition; theory.
iso-. Equal.
-ite. 1. Of the nature of. **2.** In chemistry, a salt of an acid with the termination *-ous*.
-itis. Inflammation of.
-ize. To treat by special method.
jejuno-. Jejunum.
juxta-. Close proximity.
kary-, karyo-, cary-, caryo-. Nucleus; nut.
kat-, kata-. SEE: *cat-*.
kera-, kerato-. Horny substance; cornea.
ket-, keto-. Ketone bodies (acids and acetones).
kilo-. Thousand.
kinesi-, kino-, -kinesis. Movement.
klepto-. To steal.
kolp-, kolpo-, colp-, colpo-. Vagina.
kypho-. Humped.
kysth-, kystho-. Vagina.
lab-, labi-. Lip.
lact-. Milk.
laparo-. Flank; abdominal wall.
laryng-, laryngo-. Larynx.
latero-. Side.
leio-. Smooth.
lepido-. Flakes; scales.
-lepsy. Seizure.
lepto-. Thin; fine; slight; delicate.
leuk-, leuko-, leuc-. White; white blood cell.
linguo-. Tongue.
lip-, lipo-. Fat.
-lite, -lith, lith-, litho-. Stone; calculus.
-logia, -logy. Science of; study of.
lord-, lordo-. Curve; swayback.
lumbo-. Loins.
lyo-. Loosen; dissolve.
-lysis. 1. Loosen; dissolve. **2.** In medicine, reduction of; relief from.
macr-, macro-. Large; long.
mal-. Ill; bad; poor.
mamm-, mammo-. Breast.
-mania. Frenzy; madness.
mast-, masto-. Breast.
meat-, meato-. Opening; meatus.
med-, medi-, medio-. Middle.
medull-, medullo-. Soft inner part; medulla.
mega-, megal-, megalo-. Large; of great size.
-megalia, -megaly. Enlargement of a body part.
meio-, mio-. Less; smaller.
melan-, melano-. Black.
mening-, meningo-. Meninges.
menta-, mento-. Mind.
mes-, meso-. 1. Middle. **2.** In anatomy, the mesentery. **3.** In medicine, secondary; partial.
mesio-. Toward the middle.
meta-. 1. Change; transformation; next in a series. **2.** In chemistry, the 1,3 position of benzene derivatives.
metacarp-, metacarpo-. Metacarpus (bones of the hand).
-meter. Measure.
metr-, metra-, metro-. Uterus.
micr-, micro-. Small.
mio-. SEE: *meio-*.
mon-, mono-. Single; one.
muc-, muci-, muco-, myxa-, myxo-. Mucus.
multi-. Many; much.
musculo-, my-, myo-. Muscle.
my-, myo-. SEE: *musculo-*.
myc-, myco-. Fungus.
myel-, myelo-. Spinal cord; bone marrow.
myring-, myringo-. Tympanic membrane, eardrum.
myx-, myxo-. SEE: *muc-*.
nano-. 1. One billionth. **2.** Dwarfism (nanism).
narco-. Numbness; stupor.
naso-. Nose.
necr-, necro-. Death; necrosis.
neo-. New; recent.
nephr-, nephra-, nephro-. Kidney.
neur-, neuri-, neuro-. Nerve; nervous system.
nitr-, nitro-. Nitrogen.
non-. No.
normo-. Normal; usual.
noso-. Disease.
noto-. The back.
nucleo-. Nucleus.
nyct-, nycto-. Night; darkness.
ob-. Against.
occipit-, occipito-. Occiput.
octa-, octo-. Eight.
oculo-. Eye.
-ode, -oid. Form; shape; resemblance.
odont-, odonto-. Tooth; teeth.
-odynia, odyno-. Pain.
-oid. SEE: *-ode*.
oleo-. Oil.
olig-, oligo-. Few; small.
-ology. Science of; study of.
-oma. Tumor.
omo-. Shoulder.
omphal-, omphalo-. Navel.
onco-. Tumor; swelling; mass.
onych-, onycho-. Fingernails; toenails.
oo-, ovi-, ovo-. Egg; ovum.
oophor-, oophoro-, oophoron-. Ovary.
ophthalm-, ophthalmo-. Eye.
-opia. Vision.
opisth-, opistho-. Backward.
-opsy. View of.
optico-, opto-. Eye; vision.
orchi-, orchid-, orchido-. Testicle.
-orexia. Appetite.
oro-. Mouth.
orth-, ortho-. Straight; correct; normal; in proper order.
os-. Mouth; bone.
oscheo-. Scrotum.
-ose. 1. Carbohydrate. **2.** Primary alteration of a protein.
-osis. Condition; status, process; abnormal increase.
osmo-. 1. Odor; smell. **2.** Impulse. **3.** Osmosis.
oste-, osteo-. Bone.

-ostomosis, -ostomy, -stomosis, -stomy. A created mouth or outlet.
ot-, oto-. Ear.
-otomy. Cutting.
-ous. 1. Possessing; full of. **2.** Pertaining to.
ovi-, ovo-. SEE: *oo-*.
ox-. Oxygen.
oxy-. 1. Sharp; keen; acute; acid; pungent. **2.** Oxygen in a compound. **3.** Hydroxyl group.
pach-, pachy-. Thick.
-pagus. Twins joined at a specific site (e.g., craniopagus).
pali-, palin-. Recurrence; repetition.
pan-. All; entire.
pant-, panto-. All or the whole of something.
papulo-. Pimple; papule.
para-, -para. 1. Prefix: near; alongside of; departure from normal. **2.** Suffix: Bearing offspring.
patell-, patello-. Patella; kneecap.
path-, patho-, -path, -pathic, -pathy. Disease; suffering.
ped-, pedi-, pedo-. Foot.
pedia-. Child.
pedicul-, pediculo-. Louse.
-penia. Decrease from normal; deficiency.
pent-, penta-. Five.
-pepsia. Digestion.
per-. Throughout; through; utterly; intense.
peri-. Around; about.
perineo-. Perineum.
peritoneo-. Peritoneum.
pero-. Deformed.
petro-. Stone; the petrous portion of the temporal bone.
-pexy. Fixation, usually surgical.
phaco-. Lens of the eye.
phag-, phago-. Eating; ingestion; devouring.
phalang-, phalango-. Phalanges (bones of fingers and toes).
phall-. Penis.
pharmaco-. Drug; medicine.
pharyng-, pharyngo-. Pharynx.
-phasia. Speech.
-phil, -philia, -philic. Love for; tendency toward; craving for.
phlebo-. Vein.
-phobia. Abnormal fear or aversion.
phono-. Sound; voice.
-phoresis. Transmission.
-phoria. In ophthalmology, a turning with reference to the visual axis.
photo-. Light.
phren-, phreno-, -phrenia. Mind; diaphragm.
-phylaxis. Protection.
physico-. Physical; natural.
physio-. Rel. to nature.
physo-. Air; gas.
phyt-, phyto-. Plant; something that grows.
pico-. One trillionth.
picr-, picro-. Bitter.
-piesis. Pressure.
pimel-, pimelo-. Fat.
plagio-. Slanting; oblique.
-plakia. Plaque.
-plasia. Growth; cellular proliferation.
plasm-, -plasm. 1. Prefix: Living substance or tissue. **2.** Suffix: To mold.
-plastic. Molded; indicates restoration of lost or badly formed features.
platy-. Broad.
-plegia. Paralysis; stroke.
pleur-, pleuro-. Pleura; side; rib.
-ploid. Chromosome pairs of a specific number.
plur-, pluri-. Several; more.
pneo-. Breath; breathing.
pneum-, pneuma-, pneumato-. Air; gas; respiration.
pneumo-, pneumono-. Air; lung.
pod-, podo-. Foot.
poikil-, poikilo-. Varied, irregular.
-poiesis, -poietic. Production; formation.
polio-. Gray matter of the nervous system.
poly-. Much; many.
post-. After.
postero-. Posterior; behind; toward the back.
-praxis. 1. Act; activity. **2.** Practice; use.
pre-. Before; in front of.
presby-. Old age.
pro-. Before; in behalf of.
proct-, procto-. Anus; rectum.
proso-. Forward, anterior.
prostat-, prostato-. Prostate gland.
proto-. 1. First. **2.** In chemistry, the lowest of a series of compounds with the same elements.
pseud-, pseudo-. False.
psych-, psycho-. Mind; mental processes.
psychro-. Cold.
-ptosis. Prolapse, downward displacement.
pubio-, pubo-. Pubic bone or region.
pulmo-. Lung.
py-, pyo-. Pus.
pycn-, pycno-, pykn-, pykno-. Dense; thick; compact; frequent.
pyelo-. Pelvis.
pyg-, pygo-. Buttocks.
pykn-, pykno-. SEE: *pycn-*.
pyle-. Orifice, esp. of the portal vein.
pyloro-. Gatekeeper; applied to the pylorus.
pyreto-. Fever.
pyro-. Heat; fire.
quadr-, quadri-. Four.
quinqu-. Five.
rachi-, rachio-. Spine.
radio-. 1. Radiant energy; a radioactive substance. **2.** In chemistry, a radioactive isotope.
re-. Back; again.
recto-. Straight; rectum.
ren-, reno-. Kidney.
reticulo-. Reticulum.
retro-. Backward; back; behind.
rhabdo-. Rod.
rheo-, -(r)rhea. Current; stream; to flow; to discharge.
rhino-. Nose.
rhizo-. Root.

rhodo-. Red.
roseo-. Rose-colored.
-(r)rhage, -(r)rhagia. Rupture; profuse fluid discharge.
-(r)rhaphy. A suturing or stitching.
-(r)rhexis. Rupture of a specific body part.
saccharo-, saccharo-. Sugar.
sacro-. Sacrum.
salping-, salpingo-. Auditory tube; fallopian tube.
sapro-. Putrid; rotten.
sarco-. Flesh.
scapho-. Boat-shaped; scaphoid.
scapulo-. Shoulder.
scato-. Dung; fecal matter.
schisto-. Split; cleft.
schizo-. Division.
scirrho-. Hard; hard tumor or scirrhus.
sclero-. Hard; relating to the sclera.
-sclerosis. Dryness; hardness.
-scope. Instrument for viewing or examining (includes other methods of examination).
-scopy. Examination.
scoto-. Darkness.
sebo-. Fatty substance.
semi-. Half.
septi-. Seven.
sero-. Serum.
sesqui-. One and one half.
sial-, sialo-. Saliva.
sidero-. Iron; steel.
-sis. SEE: *-asis*.
sitio-, sito-. Bread; made from grain; food.
skeleto-. Skeleton.
skia-. Shadow.
sodio-. Sodium.
somat-, somato-. Body.
spectro-. Appearance; image; form; spectrum.
sperma-, spermat-, spermato-. Sperm; spermatozoa.
spheno-. Wedge; sphenoid bone.
sphygmo-. Pulse.
spir-, spiro-. Breathe.
spleno-. Spleen.
spondyl-, spondylo-. Vertebra.
spongio-. Spongelike.
staphylo-. Uvula; bunch of grapes; *Staphylococcus*.
steato-. Fat.
steno-. Narrow; short.
sterco-. Feces.
stere-, stereo-. Three dimensions.
sterno-. Sternum.
stetho-. Chest.
stomato-. Mouth.
-stomosis, -stomy. SEE: *-ostomosis*.
strepto-. Twisted.
sub-. Under; beneath; in small quantity; less than normal.
super-. Above; beyond; superior.
supra-. Above; beyond; on top.
sym-. With; together with; along; beside.
syn-. Joined; together.
tachy-. Swift; rapid.
taen-, taeni-, ten-, teni-. Tapeworm.
tarso-. Flat of the foot; edge of the eyelid.
tauto-. Same.
techno-. Art; skill.
tel-, tele-. 1. End. **2.** Distant.
teleo-. Perfect; complete.
temporo-. Temples of the head.
ten-, teni-. SEE: *taen-*.
tendo-, teno-. Tendon.
ter-. Three.
tera-. One trillionth.
terato-. Severely malformed fetus.
tetra-. Four.
thalamo-. Chamber; part of the brain where a nerve originates; thalamus.
thanato-. Death.
theco-. Sheath; case; receptacle.
thermo-. Hot; heat.
thio-. Sulfur.
thorac-, thoraci-, thoraco-. Chest; chest wall.
thrombo-. Blood clot; thrombus.
thymo-. 1. Thymus. **2.** Soul; emotions.
thy-, thyro-. Thyroid gland; oblong; shield.
thyroid-, thyroido-. Thyroid gland.
toco-. Childbirth.
-tome. Cutting instrument.
tomo-. Section; layer.
-tomy. Cutting operation; excision.
ton-, tono-. Tension.
top-, topo-. Place; locale.
tox-, toxi-, toxico-, toxo-, -toxic. Toxin; poison; toxic.
trachelo-. Neck.
tracheo-. Trachea; windpipe.
trans-. Across; over; beyond; through.
traumato-. Trauma.
tri-. Three.
trich-, trichi-, tricho-. Hair.
troph-, tropho-, -trophic. Nourishment.
-tropin. Stimulation of a target organ by a substance, esp. a hormone.
tubo-. Tube.
tympan-, tympano-. Eardrum; tympanum.
typhlo-. 1. Cecum. **2.** Blindness.
typho-. Fever; typhoid.
ulo-. Scar; scarring.
ultra-. Beyond; excess.
uni-. One.
uretero-. Ureter.
urethro-. Urethra.
-uria. Urine.
urin-, urino, uro-. Urine.
uter-, utero-. Uterus.
vagin-, vagino-. Vagina.
varic-, varico-. Dilated vein.
vaso-. Vessel (e.g., blood vessel).
veno-. Vein.
ventro-, ventr-, ventri-. Abdomen; anterior surface of the body.
vertebro-. Vertebra; vertebrae.
vesico-. Bladder; vesicle.
viscero-. Viscera.
vitr-, vitro-, vitre-, vitreo-. Vitreous body (eye); glassy.
vulvo-. Covering; vulva.
xanth-. Yellow.
xeno-. Strange; foreign.
xero-. Dry.
xiph-, xiphi-, xipho-. Xiphoid cartilage.
zoo-. Animal; animal life.

APPENDIX 5
Latin and Greek Nomenclature

Appendix 5–1 English with Latin and Greek Equivalents

acid. Acidum.
ague. Febris.
and. Et.
arm. Brachium. Gr., brachion.
artery. Arteria.
attachment. Adhesio.
back. Tergum; dorsum.
backbone. Spina.
backward. Retro.
bath. Balneum.
beef. Bubula.
belly. Venter; abdomen.
bend. Flexus.
bile. Bilis. Gr., chole.
bladder. Vesica.
bleed. Fluere.
blind. Caecus.
blister. Pustula vesicatorium.
bloat. Tumere.
blood. Sanguis. Gr., haima.
blood vessel. Vena.
body. Corpus. Gr., soma.
boiling up. Effervescens.
bone. Os. Gr., osteon.
bony. Osseus.
bowels. Intestina; viscera.
bowlegged. Valgus.
brain. Cerebrum. Gr., enkephalos.
breach. Ruptura.
breast. Mamma. Gr., mastos.
breath. Halitus.
bubble. Pustula.
bulb. Bulbus.
buttock. Clunis. Gr., gloutos.
calcareous. Calci similis.
canal. Canalis.
cartilage. Cartilago. Gr., chondros.
catarrh. Coryza.
cavity. Caverna.
change. Mutatio.
chest. Thorax. Gr., thorax.
chin. Mentum. Gr., geneion.
choke. Strangulare.
clavicle. Clavicula.
congestion. Conglobatio.
consumption. Phthisis, pulmonaria.
convulsion. Convulsio.
cord. Corda.
corn. Callus-clavus.
cornea. Cornu. Gr., keras.
costive. Astrictus.
cough. Tussio.
countenance. Vultus.
cramp. Spasmus.
crisis. Dies crisimus.
cup. Poculum.
cure. Sanare.
curvature. Curvatura.
cuticle. Cuticula.
daily. Diurnus.
dandruff. Furfures capitis.
day. Dies.
dead. Mortuus; defunctus.
deadly. Lethalis.
deafness. Surditas.
decompose. Desolvere.
dental. Dentalis.
depression. Depressio.
digestive. Digestorius; pepticus.
dilute. Diluere.
discharge. Eluvies; effluens.
disease. Morbus.
dorsal. Dorsalis.
dose. Potio.
dram. Drachma.
drink. Bibere; potis.
dropsy. Hydrops; opis.
drug. Medicamentum.
duct. Ductus.
dysentery. Dysenteria.
ear. Auris. Gr., ous.
eat. Edere. Gr., phagos.
egg. Ovum.
elbow. Cubitum. Gr., ankon.
embryo. Partus immaturus.
emission. Emissio.
entrails. Viscera.
epidemic. Epidemus.
epilepsy. Morbus comitalis; epilepsia.
epileptic. Epilepticus.
erection. Erectio.
erotic. Amatorius.
eunuch. Eunuchus.
every. Omnis.
excrement. Excrementum.
excretion. Excrementum; excretio.
exhalation. Exhalatio.
exhale. Exhalare.
expel. Expellere.
expire. Expirare.
external. Externus.
extract. Extractum.
eye. Oculus. Gr., ophthalmos.
eyeball. Pupula.
eyebrow. Supercilium.
eyelid. Palpebra.
eyetooth. Dens caninus.
face. Facies.
faculty. Facultas.
faint. Collabi.
fat. Adeps. Gr., lipos.
feature. Lineomentum.
febrile. Febriculosus.
fecundity. Fecunditas.
feel. Tactus.
fever. Febris.
film. Membranula.
filter. Percolare.

finger. Digitus. Gr., daktylos.
fistula. Fistula putris.
fit. Accessus.
flesh. Carnis. Gr., sarx.
fluid. Fluidus.
food. Cibus.
foot. Pes, pedis. Gr., pous.
forearm. Brachium.
forehead. Frons.
freckle. Lentigo.
gall. Bilis.
gangrene. Gangraena.
gargle. Gargarizein.
gland. Glandula.
gleet. Ichor.
gout. Morbus articularis; (in feet) podagra.
grain. Granum.
gravel. Calculus.
grinder tooth. Dens maxillaris.
gullet. Gula.
gum. Gingiva.
gut. Intestinum.
hair. Capillus. Gr., thrix.
half. Dimidius.
hand. Manus. Gr., cheir.
harelip. Labrum fissum.
haunch. Clunis.
head. Caput. Gr., kephale.
heal. Sanare.
healer. Medicus.
healing. Salutaris.
health. Sanitas.
healthful. Salutaris; saluber.
healthy. Sanus.
hear. Audire.
hearing. Auditio; (sense of) auditus.
heart. Cor. Gr., kardia.
heartburn. Redundatio stomachi.
heat. Calor.
hectic. Hecticus.
heel. Calx, talus.
hirsute. Hirsutus.
homeopathic. Homeopathicus.
hysterics. Hysteria.
illness. Morbus.
incisor. Dens acutus.
infant. Infans; puerilis.
infect. Inficere.
infectious. Contagiosus.
infirm. Infirmus; debilis.
inflammation. Inflammatio; (of lungs) inflammatio pulmonaria.
injection. Injectio.
insane. Insanus.
intellect. Intellectus.
intercourse. Congressus.
internal. Intestinus.
intestine. Intestinum. Gr., enteron.
itch. Scabies.
itching. Pruritus.
jaw. Maxilla.
joint. Artus. Gr., arthron.
jugular vein. Vena jugularis.
kidney. Ren. Gr., nephros.
knee. Genu. Gr., gonu.
kneepan. Patella.
knuckle. Condylus.
labor. Partus.
labyrinth. Labyrinthus.
lacerate. Lacerare.
larynx. Guttur.
lateral. Lateralis.
leech. Sanguisuga.
leg. Tibia.
leprosy. Lepra.
ligament. Ligamentum. Gr., syndesmos.
ligature. Ligatura.
limb. Membrum.
lime. Calx.
listen. Auscultare.
liver. Jecur. Gr., hepar.
livid. Lividus.
loin. Lumbus. Gr., lapara.
looseness. Laxitas.
lotion. Lotio.
lukewarm. Tepidus.
lung. Pulmo. Gr., pneumon.
lymph. Lympha.
mad. Insanus.
malady. Morbus.
male. Masculinus.
malignant. Malignus.
maternity. Conditio matris.
medicated. Medicatus.
medicine. (Remedy) Medicamentum.
milk. Lac.
mind. Animus.
mix. Miscere.
mixture. Mistura.
moist. Humidus.
molar. Dens molaris.
month. Mensis.
monthly. Menstruus.
morbid. Morbidus.
mouth. Os. Gr., stoma.
mucous. Mucosus.
muscle. Musculus. Gr., mys.
mustard. Sinapis.
nail. Unguis.
navel. Umbilicus. Gr., omphalos.
neck. Cervix; collum. Gr., trachelos.
nerve. Nervus. Gr., neuron.
nipple. Papilla.
no, none. Nullus.
normal. Normalis.
nose. Nasus. Gr., rhis.
nostril. Naris.
not. Non.
nourish. Nutrire.
nourishment. Alimentus.
now. Nunc.
nudity. Nudatio.
nurse. Nutrix.
obesity. Obesitas.
ocular. Ocularis.
oculist. Ocularis medicus.
oil. Oleum.
ointment. Unguentum.
operator. Manus curatio.
opiate. Medicamentum somnificum.
optics. Optica.
orifice. Foramen.
pain. Dolor.
palate. Palatum.

palm. Palma.
parasite. Parasitus.
part. Pars.
patient. Patiens.
pectoral. Pectoralis.
pedal. Pedale.
phlegm. Pituita.
pill. Pilus.
pimple. Pustula.
plaster. Emplastrum.
poison. Venenum.
poultice. Cataplasma.
powder. Pulvis.
pregnant. Gravida.
prepare. Parare.
prescribe. Praescribere.
prescription. Praescriptum.
puberty. Pubertas.
pubic bone. Os pubis. Gr., pecten.
pulverize. Pulverare.
pupil. Pupilla.
purgative. Purgativus.
putrid. Putridus.
quinsy. Cynanche; angina.
rash. Exanthema.
recover. Convalescere.
recumbent. Recumbens.
recur. Recurrere.
redness. Rubor.
remedy. Remedium.
respiration. Respiratio.
rheum. Fluxio.
rib. Costa.
rigid. Rigidus.
ringing. Tinnitus.
rupture. Hernia.
saliva. Sputum.
sallow. Salix.
salt. Sal.
salve. Unguentum.
sane. Sanus.
scab. Scabies.
scalp. Pericranium.
scaly. Squamosus.
scar. Cicatrix.
sciatica. Ischias.
scruple. Scrupulum.
seed. Semen.
senile. Senilis.
serum. Sanguinis pars equosa.
sheath. Vagina.
shin. Tibia.
shock. Concussio; (of electricity) ictus electricus.
short. Brevis.
shoulder. Humerus. Gr., omos.
shoulder blade. Scapula.
shudder. Tremor.
sick. Aegrotus.
side. Latus.
sinew. Nervus.
skeleton. Gr., skeleton.
skin. Cutis. Gr., derma.
skull. Cranium. Gr., kranion.
sleep. Somnus.
smallpox. Variola.
smell. Odoratus.
soap. Sapo.
socket. Cavum.
soft. Mollis.
solid. Solidus.
solution. Dilutum.
soporific. Soporus.
sore. Ulcus.
spasm. Spasmus.
spinal. Dorsalis; spinalis.
spine. Spina.
spirit. Spiritus.
spittle. Sputum.
spleen. Lien.
spoon. Cochleare.
sprain. Luxatio.
stomach. Stomachus. Gr., gaster.
stone. Calculus.
stricture. Strictura.
sugar. Saccharum.
suture. Sutura.
swallow. Glutire.
sweat. Sudor. Gr., hidros.
symptom. Symptoma.
system. Systema.
tail. Cauda.
take. Sumere.
tapeworm. Taenia.
taste. Gustatus.
tear. Lacrima.
teeth. Dentes.
tendon. Tendo. Gr., tenon.
testicle. Testis. Gr., orchis.
thigh. Femur.
throat. Fauces. Gr., pharynx.
throb. Palpitare.
thumb. Pollex.
tongue. Lingua. Gr., glossa.
tonsil. Tonsilla.
tooth. Dens. Gr., odous.
troche. Trochiscus.
tube. Tuba.
twin. Geminus.
twitching. Subsultus.
ulcer. Ulcus.
unless. Nisi.
urine. Urina.
uterine. Uterinus.
vaccine. Vaccinum.
vagina. Vagina. Gr., kolpos.
valve. Valvula.
vein. Vena. Gr., phleps.
vertebra. Vertebra. Gr., spondylos.
vessel. Vas.
wash. Lavare.
water. Aqua.
wax. Cera.
waxed dressing. Ceratum.
weary. Lassus.
wet. Humidus.
windpipe. Arteria aspera.
wine. Vinum.
woman. Femina.
womb. Uterus. Gr., hystera.
worm. Vermis.
wound. Vulnus.
wrist. Carpus. Gr., karpos.
yolk. Luteum.

COLORS

black. Niger; nigra; nigrum.
blue. Caeruleus; cyaneus; lividus.
brown. Fulvus.
crimson. Coccum; coccineus.
gray. Cinereus.
green. Viridis.
lemon. Citreus.
pink. Rosaceus.
purple. Purpura; purpureus.
red. Ruber.
scarlet. Coccineus.
violet. Violaceus.
white. Albus.
yellow. Flavus; luteus; croceus.

QUALITIES

bitter. Acerbus.
chill. Friguscolum.
cold. Frigidus.
dry. Aridus.
dull. Stupidus; hebes.
faintness. Languor.
fat. Obesus; pinguis.
heat. Calor; ardor; fervor.
heavy. Gravis; ponderosus.
hot. Calidus; fervens; candens.
light. Levis.
liquid. Liquidus.
moist. Humidus; uvidus.
sharp. Acutus.
short. Brevis.
sour. Acidus.
sweet. Dulcis.
tall. Longus; celsus; procerus.
thick. Densus.
thin. Tenuis; macer.
warm. Calidus.
warmth. Calor.
weary. Lassus; languidus; fatigatus.
wet. Humidus.

METALS

copper. Cuprum; cuprinus.
gold. Aurum; aureus.
iron. Ferrum; ferreus.
silver. Argentum; argenteus.
tin. Stannum; plumbum album.

TIME

afternoon. Post meridiem.
age. Aetas; maturus; adultus; impubis.
autumn. Autumnus.
birth. Partus; natales.
breakfast. Prandium.
child. Infans; puer; filius.
daily. Diurnus.
date. Status diei.
dawn. Prima lux.
day. Dies.
death. Mors.
dinner. Cena.
evening. Vesper.
hour. Hora.
infant. Infans.
maturity. Maturitas; aetas matura.
meal. Epulae.
midnight. Media nox.
midsummer. Media aestas.
moment. Punctum.
month. Mens.
monthly. Menstruus.
morning. Matutinum.
night. Nox, noctis.
noon. Meridies.
old. Antiquus.
puberty. Pubertas.
second. Secundum.
spring. Ver; veris.
summer. Aestas.
sunrise. Solis ortus.
sunset. Solis occasus.
supper. Cena.
time. Tempus.
winter. Hiems; hiemis.
year. Annus.
young. Parvus; infans.
youth. Adolescentia.

Appendix 5–2 Latin and Greek with English Equivalent

Accessus. fit.
Acidum. acid.
Adeps. Gr., **lipos.** fat.
Adhesio. attachment.
Aegrotus. sick.
Alimentus. nourishment.
Amatorius. erotic.
Animus. mind.
Aqua. water.
Arteria. artery.
Arteria aspera. windpipe.
Artus. Gr., **arthron.** joint.
Astrictus. costive.
Audire. hear.
Auditio; (sense of) auditus. hearing.
Auris. Gr., **ous.** ear.
Auscultare. listen.
Balneum. bath.
Bibere; potis. drink.
Bilis. gall.
Bilis. Gr., **chole.** bile.
Brachium. forearm.
Brachium. Gr., **brachion.** arm.
Brevis. short.
Bubula. beef.
Bulbus. bulb.
Caecus. blind.
Calci similis. calcareous.
Calculus. gravel; stone.
Callus-clavus. corn.
Calor. heat.
Calx. lime.
Calx, talus. heel.
Canalis. canal.
Capillus. Gr., **thrix.** hair.
Caput. Gr., **kephale.** head.
Carnis. Gr., **sarx.** flesh.
Carpus. Gr., **karpos.** wrist.
Cartilago. Gr., **chondros.** cartilage.
Cataplasma. poultice.
Cauda. tail.
Caverna. cavity.
Cavum. socket.
Cera. wax.
Ceratum. waxed dressing.
Cerebrum. Gr., **enkephalos.** brain.
Cervix; collum. Gr., **trachelos.** neck.
Cibus. food.
Cicatrix. scar.
Clavicula. clavicle.
Clunis. haunch.
Clunis. Gr., **gloutos.** buttock.
Cochleare. spoon.
Collabi. faint.
Concussio; (of electricity) ictus electricus. shock.
Conditio matris. maternity.
Condylus. knuckle.
Conglobatio. congestion.
Congressus. intercourse.
Contagiosus. infectious.
Convalescere. recover.
Convulsio. convulsion.
Cor. Gr., **kardia.** heart.
Corda. cord.
Cornu. Gr., **keras.** cornea.
Corpus. Gr., **soma.** body.
Coryza. catarrh.
Costa. rib.
Cranium. Gr., **kranion.** skull.
Cubitum. Gr., **ankon.** elbow.
Curvatura. curvature.
Cuticula. cuticle.
Cutis. Gr., **derma.** skin.
Cynanche; angina. quinsy.
Dens. Gr., **odous.** tooth.
Dens acutus. incisor.
Dens caninus. eyetooth.
Dens maxillaris. grinder tooth.
Dens molaris. molar.
Dentalis. dental.
Dentes. teeth.
Depressio. depression.
Desolvere. decompose.
Dies crisimus. crisis.
Dies. day.
Digestorius; pepticus. digestive.
Digitus. Gr., **daktylos.** finger.
Diluere. dilute.
Dilutum. solution.
Dimidius. half.
Diurnus. daily.
Dolor. pain.
Dorsalis. dorsal.
Dorsalis; spinalis. spinal.
Drachma. dram.
Ductus. duct.
Dysenteria. dysentery.
Edere. Gr., **phagos.** eat.
Effervescens. boiling up.
Eluvies; effluens. discharge.
Emissio. emission.
Emplastrum. plaster.
Epidemus. epidemic.
Epilepticus. epileptic.
Erectio. erection.
Et. and.
Eunuchus. eunuch.
Exanthema. rash.
Excrementum. excrement.
Excrementum; excretio. excretion.
Exhalare. exhale.
Exhalatio. exhalation.
Expellere. expel.
Expirare. expire.
Externus. external.
Extractum. extract.
Facies. face.
Facultas. faculty.
Fauces. Gr., **pharynx.** throat.
Febriculosus. febrile.
Febris. ague; fever.
Fecunditas. fecundity.
Femina. woman.
Femur. thigh.
Fistula putris. fistula.
Flexus. bend.
Fluere. bleed.

Fluidus. fluid.
Fluxio. rheum.
Foramen. orifice.
Frons. forehead.
Furfures capitis. dandruff.
Gangraena. gangrene.
Gargarizein. gargle.
Geminus. twin.
Genu. Gr., **gonu.** knee.
Gingiva. gum.
Glandula. gland.
Glutire. swallow.
Granum. grain.
Gravida. pregnant.
Gula. gullet.
Gustatus. taste.
Guttur. larynx.
Halitus. breath.
Hecticus. hectic.
Hernia. rupture.
Hirsutus. hirsute.
Homeopathicus. homeopathic.
Humerus. Gr., **omos.** shoulder.
Humidus. moist; wet.
Hydrops; opis. dropsy.
Hysteria. hysterics.
Ichor. gleet.
Infans; puerilis. infant.
Inficere. infect.
Infirmus; debilis. infirm.
Inflammatio; (of lungs) inflammatio pulmonaria. inflammation.
Injectio. injection.
Insanus. insane; mad.
Intellectus. intellect.
Intestina; viscera. bowels.
Intestinum. gut.
Intestinum. Gr., **enteron.** intestine.
Intestinus. internal.
Ischias. sciatica.
Jecur. Gr., **hepar.** liver.
Labrum fissum. harelip.
Labyrinthus. labyrinth.
Lac. milk.
Lacerare. lacerate.
Lacrima. tear.
Lassus. weary.
Lateralis. lateral.
Latus. side.
Lavare. wash.
Laxitas. looseness.
Lentigo. freckle.
Lepra. leprosy.
Lethalis. deadly.
Lien. spleen.
Ligamentum. Gr., **syndesmos.** ligament.
Ligatura. ligature.
Lineomentum. feature.
Lingua. Gr., **glossa.** tongue.
Lividus. livid.
Lotio. lotion.
Lumbus. Gr., **lapara.** loin.
Luteum. yolk.
Luxatio. sprain.
Lympha. lymph.
Malignus. malignant.
Mamma. Gr., **mastos.** breast.
Manus. Gr., **cheir.** hand.
Manus curatio. operator.
Masculinus. male.
Maxilla. jaw.
Medicamentum. drug.
Medicamentum (Remedy). medicine.
Medicamentum somnificum. opiate.
Medicatus. medicated.
Medicus. healer.
Membranula. film.
Membrum. limb.
Mensis. month.
Menstruus. monthly.
Mentum. Gr., **geneion.** chin.
Miscere. mix.
Mistura. mixture.
Mollis. soft.
Morbidus. morbid.
Morbus. disease.
Morbus. illness; malady.
Morbus articularis; (in feet) podagra. gout.
Morbus comitalis; epilepsia. epilepsy.
Mortuus; defunctus. dead.
Mucosus. mucous.
Musculus. Gr., **mys.** muscle.
Mutatio. change.
Naris. nostril.
Nasus. Gr., **rhis.** nose.
Nervus. sinew.
Nervus. Gr., **neuron.** nerve.
Nisi. unless.
Non. not.
Normalis. normal.
Nudatio. nudity.
Nullus. no, none.
Nunc. now.
Nutrire. nourish.
Nutrix. nurse.
Obesitas. obesity.
Ocularis. ocular.
Ocularis medicus. oculist.
Oculus. Gr., **ophthalmos.** eye.
Odoratus. smell.
Oleum. oil.
Omnis. every.
Optica. optics.
Os. Gr., **osteon.** bone.
Os. Gr., **stoma.** mouth.
Os pubis. Gr., **pecten.** pubic bone.
Osseus. bony.
Ovum. egg.
Palatum. palate.
Palma. palm.
Palpebra. eyelid.
Palpitare. throb.
Papilla. nipple.
Parare. prepare.
Parasitus. parasite.
Pars. part.
Partus. labor.
Partus immaturus. embryo.
Patella. kneepan.
Patiens. patient.
Pectoralis. pectoral.
Pedale. pedal.

Percolare. filter.
Pericranium. scalp.
Pes, pedis. Gr., **pous.** foot.
Phthisis, pulmonaria. consumption.
Pilus. pill.
Pituita. phlegm.
Poculum. cup.
Pollex. thumb.
Potio. dose.
Praescribere. prescribe.
Praescriptum. prescription.
Pruritus. itching.
Pubertas. puberty.
Pulmo. Gr., **pneumon.** lung.
Pulverare. pulverize.
Pulvis. powder.
Pupilla. pupil.
Pupula. eyeball.
Purgativus. purgative.
Pustula vesicatorium. blister.
Pustula. bubble; pimple.
Putridus. putrid.
Recumbens. recumbent.
Recurrere. recur.
Redundatio stomachi. heartburn.
Remedium. remedy.
Ren. Gr., **nephros.** kidney.
Respiratio. respiration.
Retro. backward.
Rigidus. rigid.
Rubor. redness.
Ruptura. breach.
Saccharum. sugar.
Sal. salt.
Salix. sallow.
Salutaris. healing.
Salutaris; saluber. healthful.
Sanare. cure; heal.
Sanguinis pars equosa. serum.
Sanguis. Gr., **haima.** blood.
Sanguisuga. leech.
Sanitas. health.
Sanus. healthy; sane.
Sapo. soap.
Scabies. itch; scab.
Scapula. shoulder blade.
Scrupulum. scruple.
Semen. seed.
Senilis. senile.
Sinapis. mustard.
Skeleton, Gr., skeleton.
Solidus. solid.
Somnus. sleep.
Soporus. soporific.
Spasmus. cramp; spasm.
Spina. backbone; spine.
Spiritus. spirit.
Sputum. saliva; spittle.
Squamosus. scaly.
Stomachus. Gr., **gaster.** stomach.
Strangulare. choke.
Strictura. stricture.
Subsultus. twitching.
Sudor. Gr., **hidros.** sweat.
Sumere. take.
Supercilium. eyebrow.
Surditas. deafness.
Sutura. suture.
Symptoma. symptom.
Systema. system.
Tactus. feel.
Taenia. tapeworm.
Tendo. Gr., **tenon.** tendon.
Tepidus. lukewarm.
Tergum; dorsum. back.
Testis. Gr., **orchis.** testicle.
Thorax. Gr., **thorax.** chest.
Tibia. leg; shin.
Tinnitus. ringing.
Tonsilla. tonsil.
Tremor. shudder.
Trochiscus. troche.
Tuba. tube.
Tumere. bloat.
Tussio. cough.
Ulcus. sore; ulcer.
Umbilicus. Gr., **omphalos.** navel.
Unguentum. ointment; salve.
Unguis. nail.
Urina. urine.
Uterinus. uterine.
Uterus. Gr., **hystera.** womb.
Vaccinum. vaccine.
Vagina. sheath.
Vagina. Gr., **kolpos.** vagina.
Valgus. bowlegged.
Valvula. valve.
Variola. smallpox.
Vas. vessel.
Vena. blood vessel.
Vena. Gr., **phleps.** vein.
Vena jugularis. jugular vein.
Venenum. poison.
Venter; abdomen. belly.
Vermis. worm.
Vertebra. Gr., **spondylos.** vertebra.
Vesica. bladder.
Vinum. wine.
Viscera. entrails.
Vulnus. wound.
Vultus. countenance.

COLORS

Albus. white.
Caeruleus; cyaneus; lividus. blue.
Cinereus. gray.
Citreus. lemon.
Coccineus. scarlet.
Coccum; coccineus. crimson.
Flavus; luteus; croceus. yellow.
Fulvus. brown.
Niger; nigra; nigrum. black.
Purpura; purpureus. purple.
Rosaceus. pink.
Ruber. red.
Violaceus. violet.
Viridis. green.

QUALITIES

Acerbus. bitter.
Acidus. sour.
Acutus. sharp.

Aridus. dry.
Brevis. short.
Calidus. warm.
Calidus; fervens; candens. hot.
Calor. warmth.
Calor; ardor; fervor. heat.
Densus. thick.
Dulcis. sweet.
Frigidus. cold.
Friguscolum. chill.
Gravis; ponderosus. heavy.
Humidus. wet.
Humidus; uvidus. moist.
Languor. faintness.
Lassus; languidus; fatigatus. weary.
Levis. light.
Liquidus. liquid.
Longus; celsus; procerus. tall.
Obesus; pinguis. fat.
Stupidus; hebes. dull.
Tenuis; macer. thin.

METALS

Argentum; argenteus. silver.
Aurum; aureus. gold.
Cuprum; cuprinus. copper.
Ferrum; ferreus. iron.
Stannum; plumbum album. tin.

TIMES

Adolescentia. youth.
Aestas. summer.
Aetas; maturus; adultus; impubis. age.
Annus. year.
Antiquus. old.
Autumnus. autumn.
Cena. dinner; supper.
Dies. day.
Diurnus. daily.
Epulae. meal.
Hiems; hiemis. winter.
Hora. hour.
Infans. infant.
Infans; puer; filius. child.
Maturitas; aetas matura. maturity.
Matutinum. morning.
Media aestas. midsummer.
Media nox. midnight.
Mens. month.
Menstruus. monthly.
Meridies. noon.
Mors. death.
Nox, noctis. night.
Partus; natales. birth.
Parvus; infans. young.
Post meridiem. afternoon.
Prandium. breakfast.
Prima lux. dawn.
Pubertas. puberty.
Punctum. moment.
Secundum. second.
Solis occasus. sunset.
Solis ortus. sunrise.
Status diei. date.
Tempus. time.
Ver; veris. spring.
Vesper. evening.

NUMERALS (ROMAN)

SEE: *Roman Numerals Appendix*

Appendix 5–3 Greek Alphabet

Name of Letter	*Capital*	*Lower-case*	*Trans-literation*	*Name of Letter*	*Capital*	*Lower-case*	*Trans-literation*
alpha	A	α	a	xi	Ξ	ξ	x
beta	B	δ or β	b	omicron	O	o	o short
gamma	Γ	γ	g	pi	Π	π	p
delta	Δ	δ	d	rho	P	ρ	r
epsilon	E	ϵ	e short	sigma	Σ	σ or s	s
zeta	Z	ζ	z	tau	T	τ	t
eta	H	η	e long	upsilon	Υ	υ	y
theta	Θ	θ	th	phi	Φ	ϕ or φ	f
iota	I	ι	i	chi	X	χ	ch as in German "echt"
kappa	K	κ	k, c				
lambda	Λ	λ	l				
mu	M	μ	m	psi	Ψ	ψ	ps
nu	N	ν	n	omega	Ω	ω	o long

Appendix 5–4 Roman Numerals

A line placed over a letter increases its value one thousand times.

1	I	6	VI	11	XI	40	XL	90	XC	5000	$\overline{\text{V}}$

APPENDIX 6
Medical Abbreviations

A	accommodation; acetum; angström unit; anode; anterior
a	artery
$\overline{a}$	before
A_2	aortic second sound
aa	of each; arteries
abd	abdominal/abdomen
ABG	arterial blood gas
ABO	three basic blood groups
AC	alternating current; air conduction; axiocervical; adrenal cortex
a.c.	before a meal
acc.	accommodation
ACE	angiotensin-converting enzyme
ACh	acetylcholine
ACLS	advanced cardiac life support
ACTH	adrenocorticotropic hormone
AD	advance directive
ad	to; up to
ADH	antidiuretic hormone
ADHD	attention deficit-hyperactivity disorder
ADL	activities of daily living
ad lib.	freely; as desired
admov.	apply
ad sat.	to saturation
AF	atrial fibrillation
AFB	acid-fast bacillus
AFP	alpha-fetoprotein
A/G; A-G ratio	albumin/globulin ratio
Ag	silver; antigen
$AgNO_3$	silver nitrate
ah	hypermetropic astigmatism
AHF	antihemophilic factor
AI	aortic incompetence
AICD	automatic implantable cardiac defibrillator
AIDS	acquired immunodeficiency syndrome
AK	above the knee
Al	aluminum
Alb	albumin
ALS	amyotrophic lateral sclerosis
ALT	alanine aminotransferase
alt. dieb.	every other day
alt. hor.	every other hour
alt. noc.	every other night
AM	morning
Am	mixed astigmatism
a.m.a.	against medical advice
AMI	acute myocardial infarction
amp	ampule; amputation
ANA	antinuclear antibody
anat	anatomy or anatomic
ant.	anterior
A-P	anterior-posterior
A&P	auscultation and percussion
ap	before dinner
AQ, aq	water
aq. dest.	distilled water
aq. frig.	cold water
ARC	AIDS-related complex
ARDS	acute respiratory distress syndrome
ARMD	age-related macular degeneration
AS	ankylosing spondylitis; aortic stenosis; auris sinistra (left ear)
As.	astigmatism
ASCVD	atherosclerotic cardiovascular disease
ASD	atrial septal defect
AsH	hypermetropic astigmatism
AsM	myopic astigmatism
AST	aspartate aminotransferase
Ast	astigmatism
at. wt.	atomic weight
Au	gold
A-V; AV; A/V	arteriovenous; atrioventricular
av.	avoirdupois
B	boron; bacillus
Ba	barium
BAC	blood alcohol concentration
BBB	blood-brain barrier
BBT	basal body temperature
BCLS	basic cardiac life support
BE	barium enema
Be	beryllium
Bi	bismuth
bib.	drink
b.i.d.	twice a day
b.i.n.	twice a night
bipap	bilevel positive airway pressure
BK	below the knee
BM	bowel movement
BMR	basal metabolic rate
bol.	pill
BP	blood pressure
B.P.	British Pharmacopeia
BPH	benign prostatic hyperplasia
bpm	beats per minute
BSA	body surface area
BSE	breast self-examination

BUN	blood urea nitrogen
BW	birth weight
Bx	biopsy
C	Calorie (kilocalorie); Celsius
c	calorie (small calorie)
$\bar{c}$	with
ca.	about; approximately; cancer
CABG	coronary artery bypass graft
$CaCO_3$	calcium carbonate
CAD	coronary artery disease
CAH	chronic active hepatitis
Cal	large calorie
CS	culture and sensitivity
CAP	let (the patient) take
cap.	a capsule
cath	catheter
CBC	complete blood count
CC	chief complaint
cc	cubic centimeter
CCl_4	carbon tetrachloride
CCU	coronary care unit; critical care unit
CDC	Centers for Disease Control and Prevention
CF	cystic fibrosis; Christmas factor
cg	centigram
CHD	congenital heart disease; coronary heart disease
ChE	cholinesterase
CHF	congestive heart failure
CI	cardiac index
Ci	curie
CIS	carcinoma in situ
CK	creatine kinase
Cl	chlorine
cm	centimeter
c.m.s.	to be taken tomorrow morning
CMV	cytomegalovirus
c.n.	tomorrow night
CNS	central nervous system
c.n.s.	to be taken tomorrow night
CO	carbon monoxide; cardiac output
CO_2	carbon dioxide
Co	cobalt
c/o	complains of
COLD	chronic obstructive lung disease
comp.	compound; compounded of
COPD	chronic obstructive pulmonary disease
CP	cerebral palsy; cleft palate
CPAP	continuous positive airway pressure
CPC	clinicopathologic conference
CPD	cephalopelvic disproportion
CPR	cardiopulmonary resuscitation
CR	crown-rump length; conditioned reflex
CS	cesarean section
CSF	cerebrospinal fluid
CT	computed tomography
Cu	copper
CV	cardiovascular
CVA	cerebrovascular accident; costovertebral angle
CVP	central venous pressure
CVRB	critical value read back
CVS	chorionic villi sampling
CXR	chest X-ray
D	diopter; dose
d	density; right
/d	per day
D and C	dilatation and curettage
dB	decibel
DC	direct current; doctor of chiropractic
dc	discontinue
det.	let it be given
DIC	disseminated intravascular coagulation
dieb. alt.	every other day
dieb. tert.	every third day
DJD	degenerative joint disease
dil.	dilute; diluted
dim.	halved
DKA	diabetic ketoacidosis
dl	deciliter
DM	diabetes mellitus
DNA	deoxyribonucleic acid
DNR	do not resuscitate
DOA	dead on arrival
DOB	date of birth
DOE	dyspnea on exertion
DPat	diphtheria-acellular pertussis tetanus (vaccine)
DPT	diphtheria-pertussis-tetanus (vaccine)
dr.	dram
DRG	diagnosis-related group
DT's	delirium tremens
DTR	deep tendon reflex
dur. dolor	while pain lasts
Dx	diagnosis
D5W	dextrose 5% in water
E	eye; *Escherichia*
EBV	Epstein-Barr virus
ECF	extended care facility; extracellular fluid
ECG	electrocardiogram, electrocardiograph
ECHO	echocardiography
ECMO	extracorporeal membrane oxygenation

ECT	electroconvulsive therapy
ED	emergency department; effective dose; erythema dose; erectile dysfunction
EDD	estimated date of delivery (formerly EDC: estimated date of confinement)
EEG	electroencephalogram
EENT	eye, ear, nose, and throat
EIA	enzyme immunosorbent assay
EKG	electrocardiogram; electrocardiograph
elix.	elixir
Em	emmetropia
EMG	electromyogram
EMS	emergency medical service
ENT	ear, nose and throat
EOM	extraocular muscles
ER	Emergency Room
ESR	erythrocyte sedimentation rate
ESRD	end-stage renal disease
EST	electroshock therapy
F	Fahrenheit
f	female
FA	fatty acid
FD	fatal dose; focal distance
Fe	iron
FEV	forced expiratory volume
Fld	fluid
FP	family practice; family practitioner
FSH	follicle-stimulating hormone
FTT	failure to thrive
FUO	fever of unknown origin
g, gm	gram
garg	gargle
GB	gallbladder
GC	gonococcus or gonorrheal
GDM	gestational diabetes mellitus
GERD	gastroesophageal reflux disease
GFR	glomerular filtration rate
GH	growth hormone
GI	gastrointestinal
GP	general practitioner
gr	grain
grad	by degrees
GRAS	generally recognized as safe
GSW	gunshot wound
GTT	glucose tolerance test
Gtt, gtt	drops
GU	genitourinary
guttat.	drop by drop
GYN	gynecology
G6PD	glucose-6-phosphate dehydrogenase
H	hydrogen
H^+	hydrogen ion
h, hr	hour
HAV	hepatitis A virus
HBV	hepatitis B virus
HCG	human chorionic gonadotropin
HCT	hematocrit
HCV	hepatitis C virus
HD	hearing distance
HDL	high-density lipoprotein
HEENT	head, eye, ear, nose, and throat
Hg	mercury
hgb	hemoglobin
Hib	*Haemophilus influenzae* type B
HIV	human immunodeficiency virus
h/o	history of
H_2O	water
H_2O_2	hydrogen peroxide
hor. decub.	bedtime
hor. som, h.s.	bedtime
HPI	history of present illness
HR	heart rate
HSV	herpes simplex virus
HTN	hypertension
HTLV-III	human T lymphotropic virus type III
hx, Hx	history
Hy	hyperopia
Hz	hertz (cycles per second)
I	iodine
^{131}I	radioactive isotope of iodine (atomic weight 131)
^{132}I	radioactive isotope of iodine (atomic weight 132)
I&O	intake and output
IBW	ideal body weight
IC	inspiratory capacity
ICP	intracranial pressure
ICS	intercostal space
ICSH	interstitial cell-stimulating hormone
ICU	intensive care unit
Id.	the same
IDDM	insulin-dependent diabetes mellitus
Ig	immunoglobulin
IM	intramuscular
in d.	daily
INF	interferon
inj.	injection
instill.	instillation
IOP	intraocular pressure
IPPB	intermittent positive pressure breathing
IQ	intelligence quotient

IRV	inspiratory reserve volume
I.U.*	international unit
IUCD	intrauterine contraceptive device
IUD	intrauterine device
IUFD	intrauterine fetal death
IV	intravenous
IVP	intravenous pyelogram
J	joule
JRA	juvenile rheumatoid arthritis
K	potassium
kg	kilogram
KI	potassium iodine
KUB	kidney, ureter, and bladder
kv	kilovolt
KVO	keep vein open
L	liter
L&D	labor and delivery
lab	laboratory
lat	lateral
lb	pound
LBW	low birth weight
LD_{50}	lethal dose, median
LDL	low-density lipoprotein
LE	lower extremity; lupus erythematosus
LGA	large for gestational age
LH	luteinizing hormone
Li	lithium
lig	ligament
liq.	liquid; fluid
LLE	left lower extremity
LLL	left lower lobe
LLQ	left lower quadrant
lmp	last menstrual period
LOC	level/loss of consciousness
LP	lumbar puncture
LR	lactated Ringer's
LTD	lowest tolerated dose
LUE	left upper extremity
LUL	left upper lobe
LUQ	left upper quadrant
LV	left ventricle
LVH	left ventricular hypertrophy
M	master; medicine; molar; thousand; muscle
m	male; meter; minim; mole; meta
MA	mental age
man. prim.	first thing in the morning
MAP	mean arterial pressure
MBD	minimal brain dysfunction
mc; mCi	millicurie
mcg	microgram
MCH	mean corpuscular hemoglobin
MCHC	mean corpuscular hemoglobin concentration
MCV	mean corpuscular volume
MD	muscular dystrophy
MDI	metered-dose inhaler
MED	minimum effective dose
mEq	milliequivalent
mEq/L	milliequivalent per liter
ME ratio	myeloid/erythroid ratio
Mg	magnesium
mg	milligram
MI	myocardial infarction
MID	minimum infective dose
mist.	a mixture
ml	milliliter
MLD	minimum lethal dose
MM	mucous membrane
mm	millimeter
mm Hg	millimeters of mercury
mMol	millimole
MMR	measles-mumps-rubella (vaccine)
Mn	manganese
mol wt	molecular weight
mor. dict.	as directed
mor. sol.	as accustomed
MPC	maximum permitted concentration
MPN	most probable number
mr	milliroentgen
MRA	magnetic resonance angiography
MRI	magnetic resonance imaging
MS	mitral stenosis; multiple sclerosis
mV	millivolt
MVA	motor vehicle accident
MW	molecular weight
My	myopia
μEq	microequivalent
μg	microgram
N	nitrogen
n	nerve
N/A	not applicable
Na	sodium
NAD	no acute distress
n.b.	note well
nCi	nanocurie
NG, ng	nasogastric
NH_3	ammonia
Ni	nickel
NICU	neonatal intensive care unit
NIDDM	non-insulin-dependent diabetes mellitus
NIH	National Institutes of Health
NKA	no known allergies
nn	nerves
noct.	in the night
noct. maneq.	night and morning
non rep; n.r.	do not repeat
NPN	nonprotein nitrogen
n.p.o.	nothing by mouth
NRC	normal retinal correspondence
NS	normal saline

NSAID	nonsteroidal anti-inflammatory drug
NSR	normal sinus rhythm
N&V, N/V	nausea and vomiting
O	pint
O_2	oxygen
OB	obstetrics
OC	oral contraceptive
O.D.	right eye
OGTT	oral glucose tolerance test
ol.	oil
om. mane vel noc.	every morning or night
omn. hor.	every hour
omn. noct.	every night
OOB	out of bed
OPD	outpatient department
OR	operating room
ORIF	open reduction and internal fixation
O.S.	left eye
os	mouth
OT	occupational therapy
OTC	over-the-counter
OU	each eye
oz	ounce
P, p	melting point
p	after
P_2	pulmonic second sound
P-A; PA; pa	posteroanterior; pulmonary artery
PABA	para-aminobenzoic acid
PALS	pediatric advanced life support
Pap test	Papanicolaou smear
part. vic	in divided doses
Pb	lead
PBI	protein-bound iodine
p.c.	after meals
PCA	patient-controlled analgesia
P CO_2	carbon dioxide pressure
PCP	*Pneumocystis carinii* pneumonia; primary care physician; primary care provider
PCWP	pulmonary capillary wedge pressure
PD	interpupillary distance
pd	prism diopter; pupillary distance
PDA	patent ductus arteriosus
PDR	*Physicians' Desk Reference*
PE	physical examination
PEEP	positive end expiratory pressure
PEFR	peak expiratory flow rate
PEG	percutaneous endoscopic gastrostomy
per	through or by
PERRLA	pupils equal, regular, react to light and accommodation
PET	positron emission tomography
pH	hydrogen ion concentration
Pharm; Phar.	pharmacy
PI	present illness; previous illness
PICC	peripherally inserted central catheter
PID	pelvic inflammatory disease
pil.	pill
PKU	phenylketonuria
PM	afternoon/evening
PMH	past medical history
PMI	point of maximal impulse
PMN	polymorphonuclear neutrophil leukocytes
PMS	premenstrual syndrome; premenstrual dysphoric disorder
PND	paroxysmal nocturnal dyspnea
PNH	paroxysmal nocturnal hemoglobinuria
PO; p.o.	orally (per os)
post.	posterior
PPD	purified protein derivative (TB test)
ppm	parts per million
p.r.	through the rectum
p.r.n.	as needed
pro time/PT	prothrombin time
PSA	prostate-specific antigen
PT	prothrombin time; physical therapy
Pt	platinum; patient
pt	pint
PTT	partial thromboplastin time
Pu	plutonium
p.v.	through the vagina
PVC	premature ventricular contraction
q	every
q.d.*	every day
q.h.	every hour
q.2h.	every 2 hours
q.3h.	every 3 hours
q.4h.	every 4 hours
q.i.d*	four times a day
q.l.	as much as wanted
qns	quantity not sufficient
q.o.d*	every other day
q.p.	as much as desired
q.s.	as much as needed
qt	quart
q.v.	as much as you please
RA	rheumatoid arthritis
Ra	radium
rad	radiation absorbed dose
RAI	radioactive iodine
RAIU	radioactive iodine uptake
RBC	red blood cell; red blood count

RDA	recommended daily/ dietary allowance
RDS	respiratory distress syndrome
RE	right eye
Re	rhenium
REM	rapid eye movements
Rh	symbol of rhesus factor; symbol for rhodium
RHD	rheumatic heart disease
RLE	right lower extremity
RLL	right lower lobe
RLQ	right lower quadrant
RML	right middle lobe of lung
Rn	radon
RNA	ribonucleic acid
R/O	rule out
ROM	range of motion
ROS	review of systems
RPM	revolutions per minute
RQ	respiratory quotient
RR	recovery room; respiratory rate
RT	radiation therapy; respiratory therapy
R/T	related to
RUE	right upper extremity
RUL	right upper lobe
RUQ	right upper quadrant
S	mark
$\bar{s}$	without
S.	sacral
S-A; S/A; SA	sinoatrial
SB	small bowel
Sb	antimony
SC, sc, s.c.	subcutaneous(ly)
S.D.	standard deviation
S.E.	standard error
Se	selenium
Sed rate	sedimentation rate
semih.	half an hour
SGA	small for gestational age
SI	international system of units (Système International); stroke index
Si	silicon
SIDS	sudden infant death syndrome
Sig.	write on label
SLE	systemic lupus erythematosus
SLP	speech-language pathology
Sn	tin
SNF	skilled nursing facility
SOB	shortness of breath
sol	solution, dissolved
s.o.s.	if necessary
S/P	no change after
sp gr	specific gravity
sph	spherical
spt.	spirit
s.q.	subcutaneous(ly)
Sr	strontium
ss	a half
SSS	sick sinus syndrome
st.	let it (them) stand
Staph	*Staphylococcus*
stat.	immediately
STD	sexually transmitted disease
Strep	*Streptococcus*
STS	serologic test for syphilis
STU	skin test unit
SV	stroke volume; supraventricular
Sx	symptoms
syr.	syrup
T	temperature
T_3	triiodothyronine
T_4	thyroxine
TA	toxin-antitoxin
Ta	tantalum
T&A	tonsillectomy and adenoidectomy
TAH	total abdominal hysterectomy
TAT	thematic apperception test
T.A.T.	toxin-antitoxin
TB	tuberculin; tuberculosis; tubercle bacillus
Tb	terbium
t.d.s.	to be taken three times daily
Te	tellurium; tetanus
TENS	transcutaneous electrical nerve stimulation
Th	thorium
TIA	transient ischemic attack
TIBC	total iron-binding capacity
t.i.d.	three times a day
t.i.n.	three times a night
tinct., tr	tincture
Tl	thallium
TLC, tlc	tender loving care; thin layer chromatography; total lung capacity
TM	tympanic membrane
TMJ	temporomandibular joint
TNT	trinitrotoluene
TNTM	too numerous to mention
top.	topically
TORB	telephone order read back
TPI	*Treponema pallidum* immobilization test for syphilis
TPN	total parenteral nutrition
TPR	temperature, pulse, and respiration
trit.	triturate or grind
TSD	time since death

TSE	testicular self-examination
TSH	thyroid-stimulating hormone
TUR	transurethral resection
TURP	transurethral resection of the prostate
Tx	treatment
U	uranium; unit*
UA	urinalysis
UE	upper extremity
UHF	ultrahigh frequency
ult. praes.	the last ordered
Umb; umb	umbilicus
ung.	ointment
URI	upper respiratory infection
US	ultrasonic
USAN	United States Adopted Name
USP	United States Pharmacopeia
ut. dict.	as directed
UTI	urinary tract infection
UV	ultraviolet
v	vein
VA	visual acuity
VC	vital capacity
VD	venereal disease
VDRL	Venereal Disease Research Laboratories
Vf	field of vision
VLBW	very low birth weight
VLDL	very low density lipoprotein
VMA	vanillylmandelic acid
vol.	volume
vol %	volume percent
VORB	verbal order read back
VS	volumetric solution; vesicular sound; vital signs
VSD	ventricular septal defect
vv	veins
VZIG	varicella zoster immune globulin
W	tungsten
w	watt
WBC	white blood cell; white blood count
WDWN	well-developed, well-nourished
WF/BF	white female/black female
WH	well-hydrated
WM/BM	white male/black male
WN	well-nourished
WNL	within normal limits
wt.	weight
w/v.	weight in volume
x	multiplied by
yo	years old
yr	year
Z	atomic number
Zn	zinc

* To avoid errors in the administration of medications and infusions, spell out the word instead of using the indicated abbreviation. For example, use “international unit” instead of “I.U.”; “every day” instead of “q.d.”; “every other day” instead of “q.o.d.”; “four times a day” instead of “q.i.d.”; and “unit” instead of “U.”

APPENDIX 7
Symbols

$\overline{3}$	Ounce	+	Plus; excess; acid reaction; positive
O	Pint		
lb	Pound	−	Minus; deficiency; alkaline reaction; negative
℞	Recipe (L. take)		
$\overline{M}$	Misce (L. mix)	±	Plus or minus; either positive or negative; indefinite
$\overline{aa}$	Of each		
A, Å, AU	angström unit	#	Number; following a number, pounds
C-1, C-2, etc.	Complement		
c, $\overline{c}$	cum (L. with)	÷	Divided by
Δ	Change; heat	×	Multiplied by; magnification
E_0	Electroaffinity	/	Divided by
F_1	First filial generation	=	Equals
F_2	Second filial generation	≈	Approximately equal
mμ	Millimicron, nanometer	>	Greater than; from which is derived
μg	Microgram		
mEq	Milliequivalent	<	Less than; derived from
mg	Milligram	≮	Not less than
mg%	Milligrams percent; milligrams per 100 ml	≯	Not greater than
		≤	Equal to or less than
n	Subscripted n indicates the number of the molecules can vary from two to greater	≥	Equal to or greater than
		≠	Not equal to
		$\sqrt{}$	Root; square root; radical
		$\sqrt[2]{}$	Square root
		$\sqrt[3]{}$	Cube root
QO_2	Oxygen consumption	∞	Infinity
m-	Meta-	:	Ratio; "is to"
o-	Ortho-	::	Equality between ratios, "as"
p-	Para-	∴	Therefore
$\overline{p}$	After	°	Degree
PO_2	Partial pressure of oxygen	%	Percent
PCO_2	Partial pressure of carbon dioxide	π	pi = 3.1416—ratio of circumference of a circle to its diameter
$\overline{s}$	Without		
$\overline{ss}$, ss	[L. semis]. One half	□, ♂	Male
μm	Micrometer	○, ♀	Female
μ	Micron (former term for micrometer)	⇌	Denotes a reversible reaction
		↑	Increase
$\mu\mu$	Micromicron	↓	Decrease

APPENDIX 8

Units of Measurement (Including SI Units)

Appendix 8–1 Scientific Notation

Sometimes it is necessary to use very large and very small numbers. These can best be indicated and handled in calculations by use of scientific notation, which is to say by use of exponents. Use of scientific notation requires writing the number so that it is the result of multiplying some whole number power of 10 by a number between 1 and 10. Examples are:

$$1234 = 1.234 \times 10^3$$

$$0.01234 = 1.234 \times \frac{1}{100} = 1.234 \times 10^{-2}$$

$$0.001234 = 1.234 \times \frac{1}{1000} = 1.234 \times 10^{-3}$$

To convert a number to its equivalent in scientific notation:

Place the decimal point to the right of the first non-zero digit. This will now be a number between 1 and 9.

Multiply this number by a power of 10, the exponent of which is equal to the number of places the decimal point was moved. The exponent is positive if the decimal point was moved to the left, and negative if it was moved to the right. For example:

$$\frac{1{,}234{,}000.0 \times 0.000072}{6000.0} = \frac{1.234 \times 10^6 \times 7.2 \times 10^{-5}}{6.0 \times 10^3}$$

Now, by simply adding or subtracting the exponents of ten, and remembering that moving an exponent from the denominator of the fraction to the numerator changes its sign,

$$= \frac{1.234 \times 10^6 \times 10^{-5} \times 10^{-3} \times 7.2}{6} = \frac{1.234 \times 10^{-2} \times 7.2}{6}$$

Now, dividing by 6,

$$= 1.234 \times 10^{-2} \times 1.2 = 1.4808 \times 10^{-2} = \frac{1.4808}{100} = 0.014808$$

The last operation changed 1.4808×10^{-2} into the final value, 0.014808, which is not expressed in scientific notation.

Appendix 8–2 SI Units (Système International d'Unités or International System of Units)

This system includes two types of units important in clinical medicine. The *base units* are shown in the first table, derived units in the second table, and derived units with special names in the third table.

SI BASE UNITS

Quantity	*Name*	*Symbol*
Length	meter	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Temperature	kelvin	K
Luminous intensity	candela	cd
Amount of a substance	mole	mol

SOME SI DERIVED UNITS

Quantity	*Name of Derived Unit*	*Symbol*
Area	square meter	m^2
Volume	cubic meter	m^3
Speed, velocity	meter per second	m/s
Acceleration	meter per second squared	m/s^2
Mass density	kilogram per cubic meter	kg/m^3
Concentration of a substance	mole per cubic meter	mol/m^3
Specific volume	cubic meter per kilogram	m^3/kg
Luminescence	candela per square meter	cd/m^2
Body mass index	kilogram per meter squared	kg/m^2

SI DERIVED UNITS WITH SPECIAL NAMES

Quantity	*Name*	*Symbol*	*Expressed in Terms of Other Units*
Frequency	hertz	Hz	s^{-1}
Force	newton	N	$kg{\cdot}m{\cdot}s^{-2}$ or $kg{\cdot}m/s^2$
Pressure	pascal	Pa	$N{\cdot}m^{-2}$ or N/m^2
Energy, work, amount of heat	joule	J	$kg{\cdot}m^2{\cdot}s^{-2}$ or N·m
Power	watt	W	J·s or J/s
Quantity of electricity	coulomb	C	A·s
Electromotive force	volt	V	W/A
Capacitance	farad	F	C/V
Electrical resistance	ohm	Ω	V/A
Conductance	siemens	S	A/V
Inductance	henry	H	$W\phi/A$
Illuminance	lux	lx	lm/m^2
Absorbed (radiation) dose	gray	Gy	J/kg
Dose equivalent (radiation)	sievert	Sv	J/kg
Activity (radiation)	becquerel	Bq	s^{-1}

PREFIXES AND MULTIPLES USED IN SI

Prefix	*Symbol*	*Power*	*Multiple or Portion of a Multiple*
tera	T	10^{12}	1,000,000,000,000.
giga	G	10^9	1,000,000,000.
mega	M	10^6	1,000,000.
kilo	k	10^3	1,000.
hecto	h	10^2	100.
deca	da	10^1	10.
unity			1
deci	d	10^{-1}	0.1
centi	c	10^{-2}	0.01
milli	m	10^{-3}	0.001
micro	μ	10^{-6}	0.000001
nano	n	10^{-9}	0.000000001
pico	p	10^{-12}	0.000000000001
femto	f	10^{-15}	0.000000000000001
atto	a	10^{-18}	0.000000000000000001

Appendix 8–3 Metric System

MASSES

Mass		*Grams*
1 kilogram	=	1000.0
1 hectogram	=	100.0
1 decagram	=	10.0

MASSES (Continued)

Mass		*Grams*
1 gram	=	1.0
1 decigram	=	0.1
1 centigram	=	0.01
1 milligram	=	0.001
1 microgram	=	10^{-6}
1 nanogram	=	10^{-9}
1 picogram	=	10^{-12}
1 femtogram	=	10^{-15}
1 attogram	=	10^{-18}

Arabic numbers are used with masses and measures, as 10 g, or 3 ml. Portions of masses and measures are usually expressed decimally, e.g., 10^{-1} indicates 0.1; 10^{-6} = 0.000001. SEE: Appendix 8–1: Scientific Notation Appendix.

Appendix 8–4 Weights and Measures

Arabic numerals are used with masses and measures, as 10 g, or 3 ml. Portions of masses and measures are usually expressed decimally. For practical purposes, 1 cm^3 (cubic centimeter) is equivalent to 1 ml (milliliter) and 1 drop (gtt.) of water is equivalent to a minim (m).

LENGTH

Millimeters (mm)	*Centimeters (cm)*	*Inches (in)*	*Feet (ft)*	*Yards (yd)*	*Meters (m)*
1.0	0.1	0.03937	0.00328	0.0011	0.001
10.0	1.0	0.3937	0.03281	0.0109	0.01
25.4	2.54	1.0	0.0833	0.0278	0.0254
304.8	30.48	12.0	1.0	0.333	0.3048
914.40	91.44	36.0	3.0	1.0	0.9144
1000.0	100.0	39.37	3.2808	1.0936	1.0

1 μm = 1 micrometer = 0.001 millimeter. 1 mm = 100 μm.
1 km = 1 kilometer = 1000 meters = 0.62137 statute mile.
1 statute mile = 5280 feet = 1.609 kilometers.
1 nautical mile = 6076.042 feet = 1852.276 meters.

VOLUME (FLUID)

Milliliters (ml)	*Cubic Inches (in^3)*	*U.S. Fluid Quarts (qt)*	*Liters (L)*
1.0	0.061	0.00106	0.001
3.697	0.226	0.00391	0.00369
16.3866	1.0	0.0173	0.01639
29.573	1.8047	0.03125	0.02957
946.332	57.75	1.0	0.9463
1000.0	61.025	1.0567	1.0

1 gallon = 4 quarts = 8 pints = 3.785 liters.
1 pint = 473.16 ml.

WEIGHT

Grains (gr)	*Grams (g)*	*Apothecaries' Ounces ($f\overline{3}$)*	*Kilograms (kg)*
1.0	0.0648	0.00208	0.000065
15.432	1.0	0.03215	0.001
480.0	31.1	1.0	0.0311
7000.0	453.5924	14.583	0.45359
15432.358	1000.0	32.15	1.0

1 microgram (μg) = 0.001 milligram.
1 mg = 1 milligram = 0.001 g; 1000 mg = 1 g.

CIRCULAR MEASURE

60 seconds = 1 minute
90 degrees = 1 quadrant
60 minutes = 1 degree
4 quadrants = 360 degrees = circle

LIQUID MEASURE

16 ounces = 1 pint
1000 milliliters = 1 liter
4 gills = 1 pint
4 quarts = 1 gallon
31.5 gallons = 1 barrel (U.S.)
2 pints = 1 quart
1 quart = 946.35 milliliters
1 liter = 1.0566 quart

A U.S. gallon is equal to 0.8327 British gallon; therefore, a British gallon is equal to 1.201 U.S. gallons. 1 liter is equal to 1.0567 quarts.

LINEAR MEASURE

1 inch = 2.54 centimeters
12 inches = 1 foot
1 statute mile = 5280 feet
40 rods = 1 furlong
3 feet = 1 yard
3 statute miles = 1 statute league
8 furlongs = 1 statute mile
5.5 yards = 1 rod
1 nautical mile = 6076.042 feet

HOUSEHOLD MEASURES AND WEIGHTS

Approximate Equivalents: 60 gtt. = 1 teaspoonful = 5 ml = 60 minims = $\frac{1}{8}$ ounce

1 teaspoon = $\frac{1}{8}$ fl oz
3 teaspoons = 1 tablespoon
1 tablespoon = $\frac{1}{2}$ fl oz
16 teaspoons (liquid) = 1 cup
12 tablespoons (dry) = 1 cup
1 cup = 8 fl oz
1 tumbler or glass = 8 fl oz; $\frac{1}{2}$ pint

* Household measures are not precise. For instance, a household tsp will hold from 3 to 5 ml of liquid. Therefore, household equivalents should not be substituted for medication prescribed by the physician.
NOTE: Traditionally, the word "weights" is used in these tables, but "masses" is the correct term.

Appendix 8–5 Conversion Rules and Factors

To convert units of one system into the other, multiply the number of units in column I by the equivalent factor opposite that unit in column II.

WEIGHT

1 gram	=	0.03527 avoirdupois ounce
1 gram	=	0.03215 apothecaries' ounce
1 kilogram	=	35.274 avoirdupois ounces
1 kilogram	=	32.151 apothecaries' ounces
1 kilogram	=	2.2046 avoirdupois pounds
1 grain	=	64.7989 milligrams
1 grain	=	0.0648 gram
1 avoirdupois ounce	=	28.3495 grams
1 apothecaries' ounce	=	31.1035 grams
1 avoirdupois pound	=	453.5924 grams

VOLUME (AIR OR GAS)

1 cubic centimeter (cm^3)	=	0.06102 cubic inch
1 cubic meter (m^3)	=	35.314 cubic feet
1 cubic meter	=	1.3079 cubic yard
1 cubic inch (in^3)	=	16.3872 cubic centimeters
1 cubic foot (ft^3)	=	0.02832 cubic meter

CAPACITY (FLUID OR LIQUID)

1 liter	=	2.1134 pints
1 liter	=	1.0567 quart
1 liter	=	0.2642 gallon
1 fluid dram	=	3.697 milliliters
1 fluid ounce	=	29.573 milliliters
1 pint	=	473.1765 milliliters
1 quart	=	946.353 milliliters
1 gallon	=	3.785 liters

TIME

1 millisecond = one thousandth (0.001) of a second
1 second = 1/60 of a minute
1 minute = 1/60 of an hour
1 hour = 1/24 of a day

TEMPERATURE

Given a temperature on the Fahrenheit scale, to convert it to degrees Celsius, subtract 32 and multiply by 5/9. Given a temperature on the Celsius scale, to convert it to degrees Fahrenheit, multiply by 9/5 and add 32. Degrees Celsius are equivalent to degrees Centigrade. SEE: *thermometer, Celsius* for table

PRESSURE

FLOW RATE

TO OBTAIN	*MULTIPLY*	*BY*
cu ft/hr	cc/min	0.00212
cu ft/hr	L/min	2.12
L/min	cu ft/hr	0.472

PARTS PER MILLION

Conversion of parts per million (ppm) to percent:
1 ppm = 0.0001%, 10 ppm = 0.001%, 100 ppm = 0.01%, 1000 ppm = 0.1%, 10,000 ppm = 1%, etc.

ENERGY

1 foot pound = 1.35582 joule
1 joule = 0.2389 Calorie (kilocalorie)
1 Calorie (kilocalorie) = 1000 calories = 4184 joules
A large Calorie, or kilocalorie, is always written with a capital C.

pH

The pH scale is simply a series of numbers stating where a given solution would stand in a series of solutions arranged according to acidity or alkalinity. At one extreme (high pH) lies a highly alkaline solution; at the other extreme (low pH) is an acid solution containing 3.65 g of hydrogen chloride per liter of water. Halfway between lies purified water, which is neutral. All other solutions can be arranged on this scale, and their acidity or alkalinity can be stated by giving the numbers that indicate their relative positions. If the pH of a certain solution is 5.3, it falls between gastric juice and urine on the pH scale, is moderately acid, and will turn litmus red.

Tenth-normal HCl	−1.00	} Litmus is red in this acid range.
Gastric juice	1.4	
Urine	6.0*	
Water	7.00	— Neutral
Blood	7.35–7.45	} Litmus is blue in this alkaline range.
Bile	7.5*	
Pancreatic juice	8.5	
Tenth-normal NaOH	13.00	

* These body fluids vary rather widely in pH; typical figures have been used for simplicity. Urine samples obtained from healthy individuals may have pH readings anywhere between 4.7 and 8.0.

APPENDIX 9
Phobias

Fear of	*Condition*	*Fear of*	*Condition*
Aging	Gerontophobia	Disease	Nosophobia, pathophobia
Air	Aerophobia	Dogs	Cynophobia
Animals	Zoophobia	Dolls	Pediophobia
Anything new	Neophobia	Drafts	Anemophobia
Bacilli	Bacillophobia	Drinking	Dipsophobia
Bearing a deformed child	Teratophobia	Dust	Amathophobia
Bees	Apiphobia, melissophobia	Eating	Phagophobia
Being alone	Isolophobia	Electricity	Electrophobia
Being buried alive	Taphephobia	Emptiness	Kenophobia, cenophobia
Being naked	Nudophobia	Error	Hamartophobia
Being poisoned	Toxiphobia	Everything	Panphobia, panophobia, pantophobia
Being tied	Merinthophobia	Excrement	Coprophobia
Birds	Ornithophobia	Eyes	Ommatophobia
Blood	Hematophobia, hemophobia	Failure	Kakorrhaphiophobia
Blushing	Ereuthrophobia	Fatigue	Kopophobia
Body hair	Hypertrichophobia	Feathers	Pteronophobia
Brain disease	Meningitophobia	Fever	Pyrexeophobia
Bridges (crossing of)	Gephyrophobia	Filth	Mysophobia
Cancer	Carcinomatophobia	Filth or odor, personal	Automysophobia
Cats	Ailurophobia, galeophobia	Fire	Pyrophobia
Change or novelty	Kainophobia	Fish	Ichthyophobia
Childbirth	Tocophobia, Parturiphobia	Floods	Antlophobia
Choking	Pnigophobia	Fog	Homichlophobia
Coitus	Cypriphobia	Food	Cibophobia, sitophobia
Cold or something cold	Psychrophobia	Foods containing protein	Proteinophobia
Color(s)	Chromatophobia, chromophobia	Forest	Hylophobia
Confinement	Claustrophobia	Frogs	Batrachophobia
Contamination or infection	Molysmophobia	Gaiety	Cherophobia
Corpses	Necrophobia	Ghosts	Phasmophobia
Crowds	Ochlophobia	Girls	Parthenophobia
Dampness	Hygrophobia	Glare of light	Photaugiaphobia
Darkness	Nyctophobia, scotophobia	Glass	Crystallophobia, hyalophobia
Dawn	Eosophobia	God	Theophobia
Daylight	Phengophobia	Gravity	Barophobia
Decision-Making	Decidophobia	Hair	Trichopathophobia
Death	Thanatophobia	Heat	Thermophobia
Defecating	Defecalgesiophobia	Height	Acrophobia
Defecation, feces, filth	Rhypophobia	Hell	Hadephobia, stygiophobia
Definite, specific disease	Monopathophobia	Heredity and hereditary disease	Patroiophobia
Deformity	Dysmorphophobia	High objects or being on tall buildings	Batophobia
Depth	Bathophobia	High places	Hypsophobia
Developing a phobia	Phobophobia	House, being in a	Domatophobia, oikophobia
Dirt	Mysophobia, rupophobia	Ideas	Ideophobia
		Injury	Traumatophobia
		Innovation	Neophobia
		Insane, becoming	Maniaphobia

INTRODUCTION

When attempting to communicate with a patient whose language is foreign to you, it is important to establish that while you may be able to say a few words in his or her language you will not be able to understand the patient's replies. The patient may need to use signs in replying. The following paragraphs are given for your convenience in explaining your language difficulty to the patient.

English

Hello. I want to help you. I do not speak (English) but will use this book to ask you some questions. I will not be able to understand your spoken answers. Please respond by shaking your head or raising one finger to indicate "no"; nod your head or raise two fingers to indicate "yes."

Spanish

Translation	Phonetic
Saludos. Quiero ayudarlo. Yo no hablo español, pero voy a usar este libro para hacerle algunas preguntas. No voy a poder entender sus respuestas; por eso haga el favor de contestar, negando con la cabeza o levantando un dedo para indicar "no" y afirmando con la cabeza o levantando dos dedos para indicar "sí."	Sah-loo′dohs. Ki-air′oh ah-joo-dar′loh. Joh noh ah′bloh es′panyohl, pair′oh voy ah oo-sawr′ es′tay lee′broh pahr′ah ah-sair′lay ahl-goo′nahs pray-goon′tahs. GENERAL

Basic Questions and Replies

English	*Spanish*	*French*
Good morning.	Buenos días.	Bonjour.
My name is . . . I am a (nurse, physician, social worker, psychologist, etc.).	Me llamo . . . soy (enfermera, médico, trabador social, psicólogo, etc.)	Je m'appelle . . . Je suis (infirmière, médecin, assistante sociale, psychologue, etc.)
What is your name?	¿Cómo se llama?	Quel est votre nom?
How old are you?	¿Cuántos años tiene?	Quel âge avez-vous?
Do you understand me?	¿Me entiende?	Me comprenez-vous?
Answer only . . .	Contestesolamente . . .	Répondez seulement . . .
Yes No	Sí No	Oui Non
What do you say?	¿Qué dice?	Que dites-vous?
Speak slower.	Hable más despacio.	Parlez plus lentement.
Say it once again.	Repítalo, por favor.	Répétez ça.
Don't be afraid.	No tenga miedo.	N'ayez pas peur.
Try to recollect.	Trate de recordar.	Cherchez à vous rappeler.
You cannot remember?	¿No recuerda?	Vous ne vous en souvenez pas?
Come to my office.	Venga a mi oficina.	Venez à mon bureau.
Please remove all your clothes and put on this gown.	Por favor, quítese la ropa y póngase esta bata.	S'il vous plaît, déshabillez-vous et mettez cette robe.
You will?	¿Ud. quiere? Ud.—Usted.	Vous voulez bien?
You will not?	¿No quiere Ud.?	Vous ne voulez pas?
You don't know?	¿No sabe?	Vous ne savez pas?
Is it impossible?	¿Es imposible?	C'est impossible?
It is necessary.	Es necesario.	C'est necéssaire.
That is right.	Está bien.	C'est bien.
Show me . . .	Enséñeme . . .	Montrez-moi . . .
Here There	Aquí Allí	Ici Là
Which side?	¿En qué lado?	Quel côté?
Since when?	¿Desde cuándo?	Depuis quand?
Right	Derecha	A droite
Left	Izquierda	A gauche
More or less	Más o menos	Plus ou moins
How long?	¿Cuánto tiempo?	Combien de temps?
Not much	No mucho	Pas beaucoup
Try again.	Trate otra vez.	Essayez encore une fois.
Never	Nunca	Jamais
Never mind.	Olvídelo.	Ça ne fait rien.
That will do.	Suficiente.	Ça suffit.
About how much daily?	¿Más o menos qué cantidad diaramente?	A peu près combien par jour?

Apply ice (for 20 minutes of every hour for the next 2 days).	Ponga hielo (por 20 minutos de cada hora durante los 2 próximos días).	Mettez de la glace (pour 20 minutes de chaque heure pendant les 2 jours suivants).
[Length and duration of treatment are specified.]		
Wash the wound with . . .	Lave la herida con . . .	Lavez la blessure avec . . .
Apply a bandage to . . .	Ponga un vendaje a . . .	Mettez un bandage à . . .
Keep the bandage dry and clean.	Mantenga el vendaje limpio y seco.	Gardez le bandage propre et sec.
Wash your hands thoroughly before and after treatment (caring for the wound/applying drops).	Lávese las manos completamente antes y después del tratamiento (cuidando la herida/aplicando gotas).	Lavez-vous les mains complètement avant et après le traitement (soignant la blessure/applicant les gouttes).

English	*Spanish*	*French*
Apply ointment (lotion/cream/powder).	Aplíquese ungüento (loción, crema, polvos).	Appliquez un onguent (lotion, crème, poudre).
Keep very quiet.	Estése muy quieto.	Restez tranquille.
You must not speak.	No debe hablar.	Vous ne devez pas parler.
Swallow small pieces of ice.	Trague pedacitos de hielo.	Avalez de petits morceaux de glace.
Diet		
In a few days you may eat food.	Dentro de algunos días podrá comer.	Après quelques jours vous pouvez prendre de la nourriture.
You will need to eat a special (high-protein/low-fat/diabetic) diet.	Tiene que estar a una dieta de (alta proteína/baja grasa/diabética).	Vous devez suivre un régime de (haute protéine/basses graisses/diabétique).
You may eat . . .	Puede comer . . .	Vous pouvez manger . . .
Soft foods only.	Solamente comida blanda.	Seulement de la nourriture molle.
Your regular diet when your symptoms are gone.	Su dieta normal cuando terminados sus síntomas.	Votre régime normal quand vos symptômes seront terminés.
You may drink . . .	Puede tomar . . .	Vous pouvez boire . . .
Water	Agua	De l'eau
Clear liquids (tea, bouillon, Jell-O)	Líquidos claros (té, caldo, Jell-O)	Liquides clares (thé, bouillon, Jell-O)
All liquids including milk and juices	Todo líquido, inclusive leche y jugo	Toute liquide, lait et jus y compris
No caffeine (coffee, tea, chocolate, cola)	Ninguna cafeína (café, té, chocolate, cola)	Pas de caféine (café, thé, chocolat, cola)
Only decaffeinated drinks	Unicamente bebidas descafeínadas	Seulement les boissons décaféinées
Surgery		
You will need an operation on your . . . (to remove . . .)	Tendrá Ud. que operarse en su . . . (para quitarle . . .)	Il faut que l'on vous fasse une opération (pour enlever votre . . .)
You will need tests before the operation (blood tests, chest radiograph, electrocardiogram).	Tendrá que hacerse análisis antes de la operación (análisis de sangre, radiografía del pecho, electrocardiograma).	Il faut que l'on vous fasse des analyses avant l'opération (analyse du sang, radiographie de la poitrine, electrocardiogramme).
[Examiner explains nature of tests and tells patient when and where they will be given.]		
You will be in the hospital for [length of time].	Ud. estará en el hospital por [cuanto tiempo].	Vous resterez à l'hôpital pour [combien de temps].
[Examiner tells patient when and where the surgery will take place.]		
Medication (use with Numbers and Time)		
I will give you something for that.	Le daré algo para eso.	Je vous donnerai quelque chose pour cela.
I will leave a prescription.	Le dejaré una receta.	Je laisserai une ordonnance.
Use it as directed [give dosing intervals] until it is gone (until you are told to stop).	Tómelo según indicado [intervalo de dósis] hasta terminarlo (hasta que se le diga dejarlo).	Prenez-le [intervalle de dose] jusqu'au bout (jusqu'à ce que l'on vous dise d'arrêter).

English	*Spanish*	*French*
Take 1 teaspoonful three times daily (in water).	Tome 1 cucharadita tres veces al día, con agua.	Prenez-en une cuillerée à café trois fois par jour (avec de l'eau).
Take 1 tablespoonful.	Tome una cucharada.	Prenez-en une cuillerée à soupe.
Mix in [amount] of water (juice) and drink the entire amount.	Mescle en [cantidad] de agua (jugo) y beba lo todo.	Mélangez avec [quantité] d'eau (jus) et buvez le tout.
Gargle.	Haga gárgaras.	Gargarissez-vous.
Inject the drug into your abdomen (arm, leg, buttock, muscle tissue).	Inyéctese la medicina en el abdomen (el brazo, la pierna, la nalga, el tejido muscular).	Faites-vous une piqûre du médicament dans l'abdomen (le bras, la jambe, la fesse, le tissu musculaire).
Insert the suppository into your rectum (vagina).	Métase el supositorio en el recto (la vagina).	Mettez le suppositoire dans votre rectum (votre vagin).
A pill	Una píldora	Une pilule
Do not crush the tablet (open the capsule).	No aplaste el comprimido (no abra la cápsula).	N'écrasez pas le comprimé (n'ouvrez pas la capsule).
Drop [number of drops] into the right (left) eye.	Vierta [número de gotas] en el ojo derecho (izquierdo).	Versez [nombre de gouttes] dans l'oeil droit (gauche).
Drop [number of drops] into each eye.	Vierta [número de gotas] en cada ojo.	Versez [nombre de gouttes] dans chaque oeil.
Who is available to assist you at home? With medications? With diet?	¿Quién está disponible en su casa para atenderle a Ud.? ¿Con las medicinas? ¿Con la dieta?	Qui est disponible chez vous pour vous aider? Avec les médicaments? Avec le régime?
Who is available to transport you to the doctor (hospital) (home)?	¿Quién está disponible para llevarle al médico (hospital) (a casa)?	Qui est disponible pour vous conduire au médecin (à l'hôpital) (chez vous)?
NURSING CARE CONCERNS		
Do you need to pass water?	¿Necesita Ud. orinar?	Avez-vous besoin d'uriner?
Do you need to have a bowel movement?	¿Necesita Ud. evacuar el vientre?	Avez-vous besoin d'évacuer le ventre?
Do you need a drink of water?	¿Necesita Ud. tomar agua?	Avez-vous besoin de prendre de l'eau?
Do you need your mouth rinsed?	¿Necesita que le limpien la boca?	Avez-vous besoin de vous faire rincer la bouche?
Do you need something to eat?	¿Necesita Ud. algo de comer?	Avez-vous besoin de manger quelque chose?
Do you need your position changed?	¿Necesita que le cambien de posición?	Avez-vous besoin de vous faire changer de position?
Do you need medicine for pain?	¿Necesita medicina contra el dolor?	Avez-vous besoin d'un médicament pour la douleur?
You will be getting oxygen.	Le van a poner oxígeno.	On va vous donner de l'oxigène.
You will be getting a breathing treatment.	Le van a dar un tratamiento de respiración.	On va vous donner un traitement de respiration.
You will be getting intravenous fluid.	Le van a dar un flúido intravenoso.	On va vous donner un fluide intraveineux.
You will be getting a bland diet.	Le van a poner una dieta blanda.	On va vous mettre au régime simple.
You will be getting an injection.	Le van a dar una inyección.	On va vous faire une piqûre.

APPENDIX 12
Medical Emergencies

Appendix 12–1 Poisons and Poisoning

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Acetaminophen	Production of toxic intermediate metabolite that cannot be detoxified due to glutathione depletion.	Phase 1 (0–24 hr): Sometimes asymptomatic—anorexia, nausea, vomiting. Phase 2 (24–48 hr): GI symptoms resolve; hepatotoxicity is subclinical, but liver function tests and coagulation tests are abnormal. If liver damage is significant, patient may progress to phase 3. Phase 3 (48–96 hr): Problems due to severe hepatic compromise—bleeding disorders, hypoglycemia, hepatic encephalopathy. Phase 4 (>96 hr): Recovery period. Laboratory values return to normal and symptoms resolve.	Administer activated charcoal. Toxicity is unlikely at a level <140 mg/kg. For significant serum levels of acetaminophen, acetylcysteine can be administered orally in a loading dose followed by a maintenance regimen.	Patients with toxic levels of acetaminophen 4 hr after ingestion require hospitalization for observation and supportive measures. Hepatic failure can occur several days after the ingestion, and renal complications or failure can also develop. Most patients recover fully without further sequelae. In some instances, hepatic failure may require transplantation. Check acetaminophen levels routinely in patients with any oral overdose.

Acids Acetic Hydrochloric Nitric Phosphoric Sulfuric Any other strong acid	Immediate destruction and necrosis with eschar formation of mucous membranes and tissues on contact.	Burning pain on contact with mucous membranes of the mouth and throat, dysphagia, abdominal pain, nausea, hematemesis, thirst, esophageal or gastric perforation, shock, death.	Establishment of airway patency, aggressive volume resuscitation, radiographic evaluation of damage, irrigation of exposed tissues. Surgical intervention may be required.	Permanent damage to the esophagus and stomach can result in chronic dysphagia and stricture formation.
Alkalis	Irreversible destruction and liquefactive tissue necrosis that penetrates beyond surface contact with alkali.	Immediate burning and blistering of tissue on contact; severe pain of mouth, esophagus, and chest; esophageal or gastric perforation; pancreatitis; hematemesis; shock; death.	Establishment of airway patency, aggressive volume resuscitation, radiographic evaluation of damage, irrigation of exposed tissues. Surgical intervention may be required.	Permanent damage to the esophagus and stomach can result in chronic dysphagia, stricture formation, and necrosis of tissue.
Ammonia and ammonium hydroxide	Tissue destruction due to alkaline injury on contact with mucous membranes. Degree of destruction depends on alkalinity of product and amount and length of exposure.	Burning of mouth and throat, chest pain, esophageal and gastric damage, hematemesis. Inhalation of gas can cause coughing, bronchospasm, and pulmonary edema.	Airway protection if needed, supplemental humidified oxygen and bronchodilators for inhalation exposures, moderate amounts of water or milk to dilute ingestion, analgesics for pain. Additional procedures may be required to assess extent of tissue injury.	Most significant damage is seen with intentional massive ingestions or occupational exposures to concentrated strengths of ammonia. Most accidental exposures to household strength products resolve without residual damage.
Amphetamines and amphetamine-like agents	Excessive stimulation of the CNS and of peripheral alpha and beta receptor sites.	Excitement, restlessness, tremors, hyperactive reflexes, nausea, vomiting, diarrhea, palpitations, arrhythmias, hypertension, hyperthermia, dehydration, mydriasis, agitation, seizures, coma, death.	Supportive care including airway maintenance and cardiac monitoring; administration of activated charcoal and a cathartic; cooling measures for hyperthermia; benzodiazepines for seizures; vasodilators and beta-adrenergic blockers.	Toxicity can occur with slightly higher than therapeutic doses. Tolerance can readily develop with repeated use.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Antidepressants: selective serotonin reuptake inhibitors (SSRI) Fluoxetine Paroxetine Sertraline Bupropion Fluvoxamine	CNS depression, excessive stimulation of serotonin receptors.	Serotonin syndrome: hypomania, confusion, myoclonus, diaphoresis, hyperreflexia, tremor, hyperthermia, agitation, restlessness, insomnia, nausea, vomiting, drowsiness, ataxia, seizures, coma.	Maintenance of airway, breathing, and circulation; oral adminstration of activated charcoal to adsorb ingested drug from the gastrointestinal tract. Cooling measures for febrile patients, e.g., those with serotonin excess.	SSRIs are less likely than tricyclic antidepressants to cause airway compromise, cardiac dysrhythmias, coma, ICU admission, or death. Drugs (such as alcohol or sedatives) that are coingested with SSRIs may pose health risks.
Antidepressants: cyclic Amitriptyline Amoxapine Clomipramine Desipramine Doxepin Imipramine Nortriptyline Protriptyline	Toxic cardiovascular and CNS effects secondary to anticholinergic activity, inhibited reuptake of neurotransmitters, peripheral alpha-adrenergic blockade, alteration of cardiac cells resulting in conduction disturbances.	Confusion, dizziness, altered mental status (lethargy to coma), hypotension, tachycardia, hyperthermia, mydriasis, dry mucous membranes, prolonged QRS complex, cardiac dysrhythmias, seizures.	Cardiac monitoring; assessment of width of QRS complex on the 12–lead ECG; gastric decontamination with activated charcoal; alkalinization of the urine with bicarbonate-containing solutions.	Patients with wide QRS complexes (>0.12s) or cardiac dysrhythmias are monitored in the CCU or ICU.
Antihistamines: sedating (major classes) Alkylamines Ethanolamines Ethylenediamines Phenothiazines Piperazines	Excessive central and peripheral anticholinergic effects.	Lethargy, agitation, confusion, miosis, tachycardia, hyperthermia, decreased GI motility, hypotension, respiratory depression, ataxia, stupor, seizures, dysrhythmias, coma, circulatory collapse, death.	Maintenance of airway, breathing, circulation, and fluids for hypotension; gastric decontamination by activated charcoal. If patient is sedated, intubate the airway. Give IV physostigmine for anticholinergic toxicity, benzodiazepines for seizures.	Most ingestions are complex to manage because many antihistamines are commercially available in combination with various analgesics and decongestants. With early intervention, most overdoses have excellent outcomes without consequences.

Arsenic and arsenic salts	Disruption of enzymatic reactions that are essential for cellular metabolism; possible phosphate replacement or interaction with sulfhydryl groups.	Nausea, vomiting, hemorrhagic gastritis, severe watery diarrhea, dehydration, pulmonary edema, hypotension, delirium, encephalopathy, arrhythmias, convulsions, shock, death. Symptoms may have delayed onset.	Aggressive fluid replacement, activated charcoal or gastric lavage for larger ingestions, dimercaprol (BAL) 3–5 mg/kg IM every 4–6 hr for symptomatic patients.	Toxicity depends on the type of arsenic, amount involved, and route of exposure. Systemic toxicity can result from percutaneous absorption. Arsenic is a carcinogen.
Aspirin —SEE: *salicylates*				
Atropine and anticholinergic agents	Acetylcholine blockade at muscarinic receptor sites; affects exocrine glands and cardiac tissue.	Dry mouth and burning pain in throat, thirst, blurred vision, mydriasis, dry, hot, flushed skin, hyperpyrexia, tachycardia, palpitations, restlessness, excitement, confusion, convulsions, delirium; rarely, death.	Airway maintenance and ventilation assistance, gastric lavage, activated charcoal and cathartic, diazepam for sedation and control of convulsions, physostigmine 0.5–1 mg IV for severe atropine toxicity, cooling measures for hyperthermia.	Classes of drugs that possess anticholinergic activity include antihistamines, antipsychotics, antispasmodics, cyclic antidepressants, and skeletal muscle relaxants. Atropine in ophthalmic preparations may be toxic to infants/young children.
Barbiturates Amobarbital Aprobarbital Butabarbital Mephobarbital Methohexital Pentobarbital Phenobarbital Secobarbital Talbutal Thiopental	Depressed neuronal activity of the brain, hypotension caused by depression of central sympathetic tone, inhibition of cardiac contractility.	Drowsiness, confusion, ataxia, vertigo, slurred speech, shallow respiration and pulse, headache, stupor, hypotension, areflexia, cyanosis, hypothermia, cardiovascular collapse, respiratory arrest, death.	Airway maintenance and ventilation assistance, treatment of hypotension, activated charcoal and cathartic, alkalinization of urine to enhance phenobarbital elimination, hemoperfusion for severe toxicity.	Severity of toxicity depends on the agent ingested.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Benzene Xylene Toluene	Irritation of mucous membranes and airway caused by agents and their metabolites, CNS depression, myocardial effects resulting in conduction disturbances.	Burning sensation of mouth and stomach, nausea, vomiting, chest pain, cough, headache, pneumonitis (if inhaled), vertigo, ataxia, confusion, stupor, ventricular dysrhythmias, convulsions, coma, respiratory failure, death.	Airway maintenance and ventilation assistance, activated charcoal and cathartic, therapy for arrhythmias and seizures. Gastric lavage within 30 min is useful for larger ingestions.	Chronic exposure can result in permanent renal damage, bone marrow suppression, and neuropsychological damage.
Benzodiazepines Alprazolam Chlordiazepoxide Clonazepam Clorazepate Diazepam Estazolam Flurazepam Lorazepam Midazolam Oxazepam Prazepam Quazepam Temazepam Triazolam	Generalized CNS depressant effects caused by enhanced activity of gamma-aminobutyric acid, an inhibitory neurotransmitter.	Confusion, dizziness, somnolence, ataxia, hypotension, coma, respiratory depression, cardiovascular depression.	Airway maintenance and ventilation assistance, if necessary; administration of activated charcoal. For ingestions by patients with no history of chronic use, flumazenil (a benzodiazapine antagonist) can be administered as a specific antidote. Flumazenil should be avoided in chronic users – it may trigger seizures.	Generally considered safe, even in high doses. Fatalities are rare and usually due to coingestions with other CNS depressants.

Boric acid and borate salts	Exact mechanism of toxicity unknown.	Headache, nausea, vomiting (vomitus may be blue green), fever, oliguria or anuria, diarrhea, stomach pain, lethargy, restlessness, distinctive erythroderma, tremor, convulsions, renal and hepatic injury or failure, cyanosis, coma, shock with vascular collapse, death.	Airway maintenance and ventilatory assistance. Treat convulsions with benzodiazepines. Activated charcoal is not effective. Hemodialysis may sometimes be needed for large ingestions (e.g., more than 12 g).	Reports of toxicity from boric acid ingestions and exposures has declined in recent years due to decreased use as an irrigant and antiseptic agent.
Botulinum toxin	Potent neurotoxicity produced by *Clostridium botulinum;* prevents release of acetylcholine by irreversibly binding to cholinergic nerve terminals.	Nausea, vomiting, occasional diarrhea, dysphagia, diplopia, loss of visual acuity and pupillary reflexes, profuse sweating, rapid and weak pulse, death usually caused by respiratory failure. Symptoms may present up to a week after ingestion.	Airway maintenance and ventilatory assistance, as needed. Trivalent botulism antitoxin may be administered in severe overdoses to bind free toxin, although its use often causes hypersensitivity reactions.	Even with excellent supportive care, recovery may take months to years. Common long-term sequelae include dysgeusia, dry mouth, dyspepsia, constipation, tachycardia, arthralgias, and fatigue. Botulinum antitoxin is available from the local health department or the CDC [(404) 329-2888].
Cadmium salts or fumes	Diverse multisystemic toxicities that are not clearly understood.	Nausea, vomiting, diarrhea, abdominal cramps, salivation, gastritis, headache, vertigo, exhaustion, collapse, acute renal failure, chemical pneumonitis with pulmonary edema on inhalation, death.	Gastric lavage and catharsis, with chelating agents such as EDTA, may be useful in some acute exposures. Inhalation may require ventilatory support.	Long-term effects vary with duration and severity of exposure. Renal function may be affected. Chronic exposures have resulted in osteomalacia, emphysema, and increased risk of lung or prostate cancer.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Calcium channel blockers Myocardial and vascular effects Bepridil Diltiazem Verapamil Primarily vascular effects Amlodipine Felodipine Isradipine Nicardipine Nifedipine	Prevention of calcium entry into cells, resulting in decreased myocardium contractility, blockade of AV and SA nodes, and peripheral vasodilation.	Nausea, vomiting, dizziness, headache, confusion, stupor, hyperglycemia, hypotension, bradycardia, metabolic acidosis, cardiac conduction disturbances, seizures, coma, death.	Maintenance of airway, breathing, and circulation; fluids and vasopressors for hypotension; multiple-dose activated charcoal; calcium chloride or calcium gluconate for hypotension and bradydysrhythmias, atropine or isoproterenol for bradycardia.	Intentional overdoses of calcium channel blockers are life threatening and often fatal despite aggressive management.
Camphor	CNS stimulant with toxic effects; underlying mechanism is not known.	Burning of mouth and throat, nausea, vomiting, headache, CNS hyperactivity followed by CNS depression, vertigo, liver function abnormalities, delirium, tremor, convulsions, apnea, coma, death from respiratory arrest secondary to status epilepticus.	Airway maintenance, gastric lavage with copious amounts of fluid, activated charcoal and cathartic, benzodiazepines for seizures.	Fatalities have been reported with 1- or 2-g doses; however, most exposures can be effectively managed and resolved without residual complications.
Carbon monoxide	Hemoglobin binding preventing delivery of oxygen to cells; has significantly greater affinity for hemoglobin than oxygen.	Mild headache, dyspnea with moderate exertion, irritability, fatigue, nausea, vomiting, confusion, ataxia, syncope, convulsions, death from respiratory arrest.	100% oxygen by face mask or endotracheal tube, IV fluids, cardiac monitoring, hyperbaric oxygen for significant exposures.	Residual effects can include dementia, psychosis, paralysis, peripheral neuropathy, and parkinsonism. Consider CO toxicity in persons with significant smoke inhalation burns.

Carbon tetrachloride	Metabolites cause renal and hepatic toxicity; potent CNS depressant effects.	Nausea, vomiting, abdominal pain, headache, confusion, drowsiness, coma, renal and hepatic failure. Death is caused by respiratory arrest, circulatory collapse, or ventricular fibrillation.	Airway maintenance and ventilation assistance, gastric lavage, activated charcoal and cathartic, acetylcysteine to decrease effects of intermediate metabolite.	Toxicity from inhalation can be severe; small ingestions (<10 ml) can be fatal.
Chlorate salts	Potent oxidative properties that destroy red blood cells; toxicity to kidneys are due to direct effects and hemolysis.	Abdominal pain, nausea, vomiting, diarrhea, methemoglobinemia, intravascular hemolysis, delirium, coagulopathy, coma, convulsions, cyanosis, renal failure, death.	Activated charcoal and methylene blue for mild toxicities, hemodialysis to remove toxin. Sodium thiosulfate IV has been used to inactivate the chlorate ion, with inconsistent results.	In some instances, exchange transfusions have been advocated to reverse effects of poisoning.
Chlorinated compounds Chlorine Chlorine gas Sodium hypochlorite	Corrosive effect on contact with mucous membranes.	Immediate burning of mouth and throat, coughing, choking, bronchospasm, chest and abdominal pain, stridor, pulmonary edema, esophageal burns.	For inhalation, humidified supplemental oxygen and bronchodilators; for dilute ingestions, water or milk; for concentrated ingestions, gastric lavage and endoscopic evaluation.	Esophageal damage can result in stricture formation.
Chlorinated hydrocarbon pesticides Aldrin Chlordane DDT (chlorophenothane) Dieldrin Heptachlor Lindane Thiodan Toxaphene	Direct toxicity to neuronal axons, interfering with transmission; affects myocardium stability resulting in arrhythmias.	Vomiting, headache, fatigue, tremors, ataxia, weakness, confusion, seizures, respiratory depression, arrhythmias, coma. In agents other than DDT, seizure may be first sign of toxicity.	Maintenance of airway, breathing, circulation; activated charcoal and cathartic; lavage for large ingestions; multiple-dose activated charcoal and cholestyramine to enhance removal; appropriate therapy for seizures and arrhythmias.	These agents can be absorbed transdermally and by inhalation. Toxicity and outcomes vary.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Cocaine	CNS stimulation and inhibition of neuronal uptake of catecholamines, depressed conduction, and myocardial contractility.	Anxiety, agitation, delirium, hypertension, tachycardia, hyperthermia, diaphoresis, tremor, mydriasis, flushing, seizures, ECG abnormalities, stroke, areflexia, coma, death.	Airway maintenance and ventilatory assistance, cardiac monitoring, activated charcoal for ingestion, benzodiazepines, cooling measures.	Overdose can result from inhalation, injection, or absorption of the drug from the gastrointestinal tract ("body packing").
Copper salts	Mucous membrane irritation, multisystemic toxicities with salts. Elemental copper is poorly absorbed and causes little toxicity.	Pain in mouth, esophagus, and stomach; abdominal pain; vomiting; gastroenteritis; shock; hepatic and renal injury; hemolysis; seizures; coma; death.	Fluid replacement and pressors, whole-bowel irrigation; dimercaprol and penicillamine for large ingestions.	Long-term copper exposures have resulted in liver fibrosis, cirrhosis, and renal dysfunction.
Cyanide	Nonspecific inhibition of enzyme systems; binds to cytochrome oxidase of cells, blocking oxygen use.	Nausea, vomiting, abdominal pain, almond odor of breath, headache, dyspnea, agitation, confusion, syncope, convulsions, lethargy, coma, cardiovascular collapse, death. Onset of symptoms is abrupt.	Oxygen and assisted ventilation, if needed; gastric lavage, activated charcoal, and cathartic; inhalation of amyl nitrite pearls until antidote is available. Antidote kit contains amyl and sodium nitrites and sodium thiosulfate. The administration of vitamin B_{12} may be helpful.	Oxygen and assisted ventilation, if needed; activated charcoal by mouth. Antidotes include amyl and sodium nitrites and sodium thiosulfate. Vitamin B_{12} may also be used.

Digoxin and digitalis	Excessive excitability and automaticity of myocardium resulting in conduction disturbances and dysrhythmias; AV block.	Anorexia, nausea, vomiting, diarrhea, headache, fatigue, weakness, drowsiness, electrolyte disturbances, confusion, delirium, visual disturbances, dysrhythmias, bradycardia, AV block, death from ventricular fibrillation.	Cardiac monitoring, activated charcoal, digoxin-specific antibody fragments (Fab) for severe toxicity, lidocaine or phenytoin for ventricular irritability. Correct electrolyte abnormalities, such as hypokalemia, immediately.	Most poisonings result from ingestion of prescribed digoxin, esp. in patients with renal failure, hypokalemia, or advanced age.
Dinitrophenol and pentachlorophenol	Uncoupling of oxidative phosphorylation in mitochondria, hypermetabolic state and lactic acid production. Dinitrophenol oxidizes hemoglobin to methemoglobin.	Fatigue, thirst, nausea, vomiting, abdominal pain, sweating, flushing, restlessness, excitement, hyperthermia, tachycardia, hyperpnea, metabolic acidosis, cyanosis, seizures, coma, death from respiratory or circulatory failure.	Maintenance of airway, breathing, circulation; activated charcoal by mouth; methylene blue IV; fluid replacement; benzodiazepines; cooling measures.	Ingestion of 1–3 g of these agents can be lethal. Many accidental transdermal poisonings have been reported.
Ergotamines or ergot alkaloids	Central sympatholytic effects: serotonin release and interference with neuronal uptake. Peripherally, may act as a partial alpha-adrenergic agonist or an antagonist at adrenergic, dopaminergic, and tryptaminergic receptors.	Nausea, vomiting, dizziness, diarrhea, headache, thirst, weak pulse, tingling and numbness of extremities, dyspnea, hallucinations, blood pressure changes, hemorrhagic vesiculations, paresthesias, peripheral ischemia, convulsions, loss of consciousness, gangrene.	Protect the airway, and provide ventilatory assistance as needed. Give multiple doses of activated charcoal to enhance drug elimination. Provide benzodiazepines to control seizures. Use nitroglycerin, heparin, or thrombolytics for organ ischemia.	Outcome is based on route and amount of ingestion.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Ethanol	CNS depression; effects can be additive when combined with other CNS depressants.	Impaired motor coordination, slurred speech, inebriation, ataxia, peripheral vasodilation, rapid pulse, nausea, vomiting, drowsiness, stupor, coma, peripheral vascular collapse, hypotension, tachycardia, hypothermia, death from respiratory or circulatory failure.	Provide intravenous fluids, esp. with dextrose, to prevent hypoglycemia. Give patient thiamine. Provide other supportive measures, including airway control and ventilation, external warming, and prophylaxis against alcohol withdrawal symptoms as indicated.	Ethanol is often coingested with other toxic substances in suicide attempts; emergency treatment may vary depending on other substances ingested.
Ethylene glycol	Metabolism to oxalic, glyoxylic, and glycolic acids; conversion to lactate, increasing the lactic acid level; calcium oxalate crystal formation and deposition in tissues; metabolite toxicity to kidneys, CNS, and lungs.	Nausea, vomiting, excitability, hypotension, abdominal cramps, weakness, metabolic acidosis, ataxia, vertigo, arrhythmias, stupor, coma, death from respiratory or renal failure with uremia.	Maintain airway, breathing, and circulation. Provide ethanol, folic acid, 4-methylpyrazole, pyridoxine, and thiamine. Hemodialysis will remove ethylene glycol from the blood in cases of severe toxicity.	Outcomes vary; in general, comatose patients have a poor prognosis.
Fluoride salts	Direct metabolic and cytotoxic effects; multiple adverse effects from calcium and magnesium binding.	Salivation, thirst, nausea, abdominal pain, vomiting, diarrhea, muscle weakness, hypocalcemia, hyperkalemia, tetanic contractions, death due to vascular collapse and shock.	Maintenance of airway, breathing, circulation; cardiac monitoring; calcium salts; for severe toxicity, IV calcium chloride; therapy for electrolyte disturbances.	Degree of toxicity depends on salt solubility and the amount of elemental fluoride ingested. Pediatric toxicities are often caused by fluorinated toothpaste ingestions.

Hydrogen sulfide gas	Inhibition of oxidative phosphorylation enzymes, potent inhibition of cytochrome oxidase. Exposure results in cellular hypoxia.	Irritated mucous membranes, conjunctivitis, headache, nausea, vomiting, weakness, bradycardia, hypotension, dyspnea, rapid loss of consciousness with larger exposure, pulmonary edema, cyanosis, convulsions, coma, death due to cardiac or respiratory arrest.	High-flow oxygen, advanced cardiac life support as indicated, sodium nitrite, blood pressure monitoring, hyperbaric oxygen if available. Methemoglobin level should be recorded 30 min after sodium nitrite infusion.	If patient is immediately removed from the exposure, recovery may be rapid and complete. More severe exposures have resulted in permanent neurologic changes and myocardial ischemia.
Ipecac syrup or fluid extract	Cardiac and neuromuscular toxicity with systemic absorption; toxicities are seen with chronic and prolonged use.	Vomiting, diarrhea, lethargy, irritability, hypothermia, hypotonia, dehydration, gastritis, seizures, cardiac toxicity, neuromuscular toxicity, shock, death.	Activated charcoal may be given if the patient is not vomiting. Supportive care includes fluid replacement, correction of electrolyte abnormalities, cardiac monitoring, and therapy for dysrhythmias.	Chronic exposures are reported in patients with eating disorders; cases of toxicity secondary to Munchausen's syndrome by proxy have also been documented.
Iron salts	Several mechanisms: direct corrosive effects on GI mucosa, hepatocellular toxicity, cardiovascular compromise, metabolic acidosis. Neurological manifestations are caused by hypoperfusion, metabolic acidosis, and hepatic compromise.	Nausea, vomiting, severe gastroenteritis, hematemesis, diarrhea, tachypnea, tachycardia, hypotension, lethargy, cyanosis, convulsions, coma, shock, or death.	Use gastric lavage or whole-bowel irrigation to remove tablets from the gastrointestinal tract. Intravenous deferoxamine is used as an iron-chelating agent.	Patients with systemic complications require hospital admission, constant monitoring, and supportive care until resolution. Late complications (2–8 wk) include GI stricture and obstruction. Toxicity is unlikely at a dose <20 mg/kg.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Isopropanol Isopropyl alcohol Rubbing alcohol	Potent CNS depressant metabolized to acetone; may contribute to CNS depression.	Nausea, vomiting, abdominal pain, hypotension, ataxia, areflexia, inebriation, muscle weakness, ketonemia, ketonuria, respiratory depression, hemorrhagic tracheobronchitis, myocardial depression, coma, death.	Maintain airway and provide ventilatory support when neurological depression is present. Do not induce emesis. Irrigate the GI tract after recent ingestions. Use hemodialysis for near-fatal overdoses.	A majority of cases resolve without consequences.
Lead and lead salts	Heavy metal interaction with sulfhydryl groups and interference with action of numerous enzymes, interference with heme production and survival of red blood cells. Chronic exposure can cause irreversible CNS and developmental effects.	Abdominal pain, vomiting, lethargy, behavioral changes, ataxia, arthralgias, abdominal or renal colic, anemia, acute encephalopathy, seizures, coma, death.	Use whole-bowel irrigation to empty the GI tract shortly after oral ingestions. Chelating agents that remove lead from the blood include Calcium Disodium Versenate, dimercaprol and related compounds, and D-penicillamine. Seizures are treated with benzodiazepines.	Chronic exposure to lead can produce renal and neuropsychiatric effects, esp. in children. Blood lead levels and erythrocyte protoporphyrin levels are used to gauge the effect of treatment.

Lithium	Lithium often produces cellular disturbances in the central nervous system, kidneys, and gastrointestinal tract. This is probably due to its effects on cell membrane ion transport, as well as its effects on cAMP.	Nausea, vomiting, diarrhea, fine resting tremor, lethargy, confusion, tremors, ataxia, ECG abnormalities, profound weakness, muscle fasciculations, hyperreflexia, clonus, stupor, seizures, acute renal failure, coma, death.	Maintain the airway and provide assisted ventilation to patients who are comatose or difficult to arouse. For acute ingestions use gastric lavage or whole bowel irrigation. Activated charcoal is ineffective because it does not bind to metals. Hemodialysis is used to clear lithium from the body in life-threatening intoxications.	Chronic or acute-on-chronic overdoses are more life threatening than acute poisonings. Chronic exposure permits intracellular accumulation. In acute poisonings, most lithium remains in the extracellular fluid for many hours, causing toxicity.
Mercuric salts	Reaction with carboxyl, sulfhydryl, phosphoryl, and amide groups; interference with enzyme and cellular functions; toxicity involving multiple organ systems.	Burning of mouth and throat, thirst, abdominal pain, nausea, corrosive gastroenteritis, hematemesis, diarrhea, dehydration, shock, acute tubular necrosis. Neurological symptoms such as tremor, irritability and other personality changes, and depression are common.	The patient should be treated with oxygen and the gastrointestinal tract decontaminated (e.g., with whole-bowel irrigation). Chelating agents such as dimercaprol, dimercaptosuccinic acid, or D-penicillamine, should be given to bind and remove mercury from the body.	Doses of 1–4 g of mercuric chloride can be fatal. Chronic poisonings have resulted in neurological abnormalities, renal dysfunction, and gastrointestinal symptoms.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Methanol	Metabolism to formaldehyde and formic acid.	Latent period (24–72 hr) before development of symptoms, dizziness, inebriation, blurred vision, headache, nausea, vomiting, abdominal pain, delirium, visual disturbances that may progress to blindness, weak and rapid pulse, shallow respirations, cyanosis, coma, metabolic acidosis, respiratory failure, death.	Activated charcoal for recent ingestion, ethanol IV or orally to inhibit toxic metabolites, hemodialysis in severe cases, aggressive management of metabolic acidosis. Folic acid and 4-methylpyrazole can be used as antidotes.	Visual impairment, optic atrophy, and blindness are due to effects of formic acid on the optic nerve.
Mushrooms containing cyclopeptides *Amanita phalloides* (death cap) *Amanita tennifolia* *Amanita virosa* (destroying angels) *Galerina autumnalis* *Galerina marginata* *Galerina venenata* *Lepiota helveola* *Lepiota josserandii*	Cytotoxicity of cyclopeptides (phallotoxins, amatoxins, virotoxins), cellular insult causing hepatic, renal, GI , and CNS damage.	Phase 1 (6–12 hr): Nausea, abdominal pain, vomiting, watery diarrhea, thirst. Phase 2 (12–24 hr): Symptomatic improvement, elevated hepatic enzymes. Phase 3 (1–6 days): Restlessness, delirium, hallucinations, hematuria, gastroenteritis, pancreatitis, hypoglycemia, shock, acute renal failure, jaundice, hepatic coma, death.	Activated charcoal; fluid and electrolyte resuscitation; hepatic transplantation in fulminant hepatic failure.	Cyclopeptide-containing mushrooms are responsible for most mushroom fatalities in North America. Toxic cyclopeptides are heat stable, insoluble in water, and not affected by drying.

Mushrooms containing muscarine *Amanita muscaria* (fly agaric) *Amanita panterina* (panther) *Clitocybe dealbata* (sweater) *Clitocybe dilatata* *Clitocybe illudens* Most *Inocybe* species	Peripheral cholinergic effect due to muscarine; stimulation of autonomic nervous system.	Lacrimation, diaphoresis, salivation, abdominal cramps, vomiting, loss of bowel and bladder control	Gastric decontamination with activated charcoal may adsorb recently ingested mushroom toxins from the GI tract. Patients with fulminant hepatic failure will need intensive care and possible referral for liver transplantation.	Identification of ingested mushroom may help guide therapy if uneaten mushroom samples are available for analysis. Patients afflicted with fulminant liver failure have a high risk of death if a donor liver is not available.
Naphthalene	Metabolism to numerous by-products including alpha-naphthol, a potent hemolytic agent.	Fever, nausea, vomiting, abdominal pain, diarrhea, lethargy, seizures, hemolysis, pallor, jaundice, cyanosis.	Activated charcoal; IV hydration and urinary alkalinization; transfusions for hemolysis.	Hemolysis is acute and severe in patients with glucose-6-phosphate dehydrogenase deficiency. Naphthalene is used in mothballs and toilet bowl cleaners, but less toxic agents are available.
Nicotine	Binding to cholinergic nicotine receptors; toxicity due to sympathetic and parasympathetic stimulation followed by ganglionic and neuromuscular blockade.	Nausea, vomiting, abdominal pain, headache, salivation, diarrhea, hyperpnea, diaphoresis, tachycardia, hypertension, pallor, agitation, tremor, ataxia, confusion, dysrhythmias, hypotension, shock, muscle paralysis, coma, death.	Maintenance of airway, breathing, circulation; activated charcoal; thorough washing of exposed skin; therapy for seizures, hypertension, hypotension, and arrhythmias.	Because most commercial sources of nicotine are not concentrated, a majority of exposures cause mild toxicity and resolve without complications.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Nitroglycerines, nitrates, nitrites	Vasodilation causing hypotension. Nitrites are potent oxidizing agents that cause methemoglobinemia.	Headache, hypotension, syncope, skin flushing, nausea, methemoglobinemia, cyanosis, symptoms of cardiac ischemia or cerebrovascular disease, seizures secondary to hypotension.	Activated charcoal; administration of intravenous fluids, anticonvulsant medication, hemodialysis, or therapies for GI bleeding (if needed).	Most cases can be managed successfully with early, aggressive interventions.
Nonsteroidal anti-inflammatory agents Ibuprofen Ketoprofen Naproxen and many others	Inhibition of prostacyclin and prostaglandin E_2 production resulting in acute renal failure.	Nausea, vomiting, gastrointestinal distress and bleeding, tinnitus, metabolic acidosis, CNS depression, respiratory depression, mild hepatic toxicity, acute renal failure, seizures.	Activated charcoal for recent ingestions; intravenous fluids: administration of gastric protectants, e.g., proton pump inhibitors or H_2 receptor antagonists.	Baseline renal and hepatic function should be assessed. Most toxic exposures to this class of agents are successfully treated and resolve fully without residual sequelae.
Opioids and Opiates Codeine Fentanyl Heroin Morphine Methadone Oxycodone Oxycontin and other synthetic opioids	Excessive stimulation of CNS opiate receptors causing sedation and respiratory failure.	Drowsiness, nausea, dysphoria, bradypnea, miosis, hypothermia, respiratory depression, hypotension, bradycardia, weak pulse, coma, apnea, death.	The airway should be secured and ventilatory assistance provided to comatose or apneic patients. Naloxone, naltrexone, or nalmefene can be given as an antidote. Activated charcoal may adsorb recently ingested pills.	Antidotes are useful in reversing effects of the opiates, but administration may precipitate severe withdrawal symptoms. The effects of naloxone are short-term. The drug may need to be given repeatedly or by intravenous infusion to prevent repeated episodes of respiratory depression or coma.

Oxalic acid and oxalate salts	Corrosion of tissues on contact; precipitation with calcium to form insoluble deposits throughout organs, causing systemic damage.	Irrigation of mouth and esophagus, vomiting, weakness, shock, tetany, convulsions, cardiac arrest, death. Inhalation can cause pneumonitis and pulmonary edema.	Calcium chloride, calcium gluconate, or calcium carbonate to precipitate oxalate; flushing and lavage with copious amounts of water; IV calcium chloride or calcium gluconate for symptomatic hypocalcemia; maintenance of high urine output; therapy for seizures and arrhythmias.	Ingestions of 5–15 g of oxalic acid have resulted in death.
Parathion and other organophosphates	Acetylcholinesterase inhibition, resulting in excessive acetylcholine stimulation of muscarinic and nicotinic receptors.	Nausea, vomiting, diarrhea, abdominal pain, tremor, muscle fasciculations, excessive salivation and sweating, dehydration, bradycardia, weakness, shock, death usually caused by respiratory paralysis.	Maintain airway and clear secretions. Provide assistance with ventilation. Decontaminate exposed skin and remove soaked clothing. Decontaminate the GI tract. Use atropine and/or pralidoxime for anticholinergic crises. Give diazepam or related drugs for seizures, and standard antiarrhythmic protocols for ventricular rhythm disturbances.	Toxicity depends on the relative toxicity of the organophosphate and the quantity involved.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Phenol	Corrosive injury to skin, eyes, and respiratory tract; protein denaturation and coagulation necrosis.	Vomiting, diarrhea, gastrointestinal injury, agitation, confusion, seizures, hypotension, shock, coma, respiratory failure, death.	Multiple-dose activated charcoal and cathartic; washing of exposed areas; benzodiazepines for seizures. Low molecular weight polyethylene glycol has been used for gastric decontamination and topical exposures. If corrosion has occurred, tube passage may cause rupture.	Corrosive burns of the skin and mucous membranes and GI perforation can occur. Esophageal stricture and renal failure rarely occur.
Phenothiazines and neuroleptics	Prominent cardiovascular and CNS effects; toxicity due to inhibitory effects of dopaminergic, cholinergic, alpha-adrenergic, histaminic, and serotonergic receptors.	Sedation, somnolence, stupor, dry mouth, tachycardia, labile blood pressure, hypothermia or hyperthermia, dysrhythmias, extrapyramidal symptoms, coma, NMS, seizures, cardiac arrest, death, akathisias.	Maintain airway and provide ventilatory and circulatory support if necessary. Decontaminate the GI tract. Follow standard ACLS protocols for managing cardiac rhythm disturbances. Give diphenhydramine or benztropine for dystonias. Bromocriptine, benzodiazepines, and/or dantrolene may be helpful in NMS.	Although death from neuroleptic overdose is rare, NMS may be fatal in 20% or more of affected patients.

Phosphorus and phosphides	Local irritation and tissue burns; direct toxic effect to myocardium and vessels; hepatic, renal, and GI damage due to latent systemic toxicity.	Painful burns to mucous membranes and skin on contact, nausea, vomitus and diarrhea with garlicky odor, jaundice, metabolic derangements, dysrhythmias, coma, shock, seizures, hepatic or renal failure, cardiac arrest. Inhalation can cause pneumonitis and pulmonary edema.	Maintenance of airway, breathing, circulation; endoscopy to assess GI burns; cautious gastric lavage with hydrogen peroxide or potassium permanganate, followed by activated charcoal and mineral oil cathartic; fluid replacement and correction of electrolyte imbalance.	After acute effects from ingestion, a symptom-free period of a few weeks may be followed by a stage of systemic toxicity involving the liver, kidneys, heart, CNS, and GI tract.
Salicylates Aspirin Salicylate salts	Effect on multiple organ systems, metabolic derangement. Effects are due to stimulation of respiratory center, intracellular uncoupling of oxidative phosphorylation, and alteration of platelet function.	Nausea, vomiting, agitation, hyperthermia, lethargy, hyperglycemia or hypoglycemia, hyperpnea, tachypnea, tinnitus, hemorrhagic gastritis, delirium, stupor, acid-base disturbances, electrolyte imbalance, cerebral edema, convulsions, cardiovascular collapse.	Maintenance of airway, breathing, circulation; lavage; activated charcoal; urinary alkalinization; correction of acid-base and fluid-electrolyte abnormalities; hemodialysis for severe toxicity or deteriorating condition.	The prognosis of patients suffering from an acute toxic ingestion can be assessed on the basis of serum levels obtained within 6 hr of ingestion.
Strychnine	Competitive antagonism of glycine at postsynaptic spinal cord motor neuron.	Muscle twitching, extensor spasm, opisthotonos, trismus or facial grimacing, seizures, medullary paralysis, death. Symptoms occur within 20 min.	Activated charcoal; dark and quiet environment; benzodiazepines or neuromuscular blockade; mechanical ventilation.	Poisonings are rare since commercial use in rodenticides has decreased. Most exposures result in death. The approximate fatal dose for a child is 15 mg; for an adult, 5–10 mg/kg.

Poisons and Poisoning (Continued)

Substance	*Pathology*	*Symptoms*	*Emergency Measures*	*Comments*
Thallium salts	Combination with mitochondrial sulfhydryl groups, interference with oxidative phosphorylation.	Nausea, vomiting, abdominal pain, hematemesis, bloody diarrhea, headache, alopecia, hematuria, proteinuria, elevated hepatic enzymes, lethargy, tremors, ataxia, delirium, seizures, coma, death.	Activated charcoal; fluids and electrolytes intravenously; benzodiazepines for seizures. Hemoperfusion and hemodialysis may be moderately successful.	Alopecia and Mee's sign, single white transverse lines on the nails 2–3 weeks postexposure, are common diagnostic features. Long-term neurological impairment can occur.
Theophylline —SEE: *xanthine derivatives*				
Xanthine derivatives Aminophylline Caffeine Theophylline	Antagonism of adenosine activity and release of catecholamines; in high doses, phosphodiesterase inhibition. Toxic effects are secondary to smooth muscle relaxation, peripheral vasodilation, myocardial stimulation, and CNS excitation.	Nausea, protracted vomiting, hypotension, respiratory alkalosis, metabolic acidosis, hypokalemia, tachycardia, hypercalcemia, ventricular dysrhythmias, seizures, death due to cardiovascular collapse.	Activated charcoal. For deteriorating conditions, charcoal hemoperfusion. Treat seizures with benzodiazepines or barbiturates, and cardiac rhythm disturbances with standard ACLS protocols. Monitor theophylline levels several times a day.	Eliminate drugs that increase theophylline levels, such as erythromycins or related antibiotics, cimetidine, estrogens, or allopurinol. Consider use of safer drugs for obstructive lung diseases, such as albuterol or other inhaled medications.

Warfarin and related anticoagulant compounds	Inhibition of vitamin K 2,3-epoxide reductase and quinone reductase activity (these are necessary to activate vitamin K, which is essential in coagulation).	Fatigue, hematuria, nosebleeds, ecchymoses, GI hemorrhage, hypotension, intracranial hemorrhage, hemorrhagic shock, death (rare).	Decontaminate the GI tract (for recent ingestions only). Hold warfarin if the protime is slightly elevated and no bleeding is present. Give vitamin K for markedly prolonged protimes with INR greater than 6–9 or fresh frozen plasma for life-threatening bleeding.	Most accidental ingestions resolve without further sequelae. Intentional ingestions or delay in seeking treatment may result in severe coagulopathy. Bleeding patients require hospitalization, frequent monitoring of blood pressure, pulse, and hemoglobin levels. Cauterization of bleeding lesions may be needed.

AV = atrioventricular; BAL = British anti-lewisite; CNS = central nervous system; ECG = electrocardiogram; EDTA = ethylenediamenetetra-acetic acid; GI = gastrointestinal; NMS = neuroleptic malignant syndrome; PT = prothrombin time; SA = sinoatrial.

Appendix 12–2 Emergency Situations

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Acute myocardial infarction (MI, AMI) Acute coronary syndromes (ACS)	Most heart attacks are caused by the rupture of a plaque in the wall of the coronary artery that results in the blockage of blood flow and the death of myocardial tissue. Risk factors often present include tobacco use, hypertension, hypercholesterolemia, diabetes mellitus, obesity, physical inactivity, or family history of heart disease. Men and postmenopausal women are at greater risk than premenopausal women. Modification of risk factors lowers the risk for disease.	Patients often complain of tightness, heaviness, pressure, pain, or burning in the chest. The symptoms may radiate into the neck, jaw, shoulders, back, or arms. Shortness of breath, nausea and vomiting, or sweating often accompany the chest pain or pressure. Some patients (esp. older individuals, women, or diabetics) may report difficulty breathing, nausea and vomiting, or loss of consciousness as their only symptoms. A 12-lead ECG may show evidence of an MI, although a large percentage of patients may have a nondiagnostic ECG initially. Abnormal levels of cardiac enzymes (e.g., troponins, creatinine kinase) usually appear in the blood about 8 hr after chest pain begins.	Oxygen, aspirin, beta blockers, nitrates, morphine, heparins, glycoprotein IIB/IIIA antagonists, thrombolytic (clot-busting) drugs, and ACE inhibitors may be used acutely. Cardiac monitoring, an oximeter, and automatic blood pressure monitors are used to identify changes in hemodynamic and respiratory status. Angioplasty may be used to open the blocked blood vessel. Other treatments may depend on the presentation (e.g., the patient in shock may be treated with pressors); the patient in full cardiac arrest is treated with standard life support protocols.

Airway obstruction	Complete or partial obstruction of the oropharynx or nasopharynx, larynx, or trachea, with impairment of gas exchange, caused by foreign bodies, anatomical abnormalities, allergic reactions, infection, or trauma.	Signs of respiratory distress, including a rapid respiratory rate, wheezing, stridor, or labored breath are usually present. The patient usually appears agitated. Cyanosis of the fingers or lips may be present when there is inadequate oxygen in the blood. Loss of consciousness may occur if airway obstruction is not effectively relieved.	Foreign body airway obstruction is treated using the Heimlich maneuver in adults and back blows and chest thrusts in infants and children. Endotracheal intubation or cricothyroidotomy, along with mechanical ventilation, may be lifesaving interventions.
Angina pectoris	Inadequate supply of oxygen to the myocardium when oxygen demand exceeds supply. Unstable angina, marked by more frequent attacks, pain with less exertion or at rest, reduced response to nitroglycerin, or more severe episodes may indicate a progression in the patient's coronary artery disease and a higher risk for MI. Stable angina is discomfort typical of the patient's usual pattern.	Similar to MI. Chest discomfort typically resolves in less than 15 min, and improves with nitroglycerin and rest. There may be evidence of ischemia on a 12-lead ECG. Cardiac enzymes usually do not show evidence of acute MI on initial testing.	Oxygen, nitroglycerin, and aspirin are given initially, and the patient's response is noted. Beta blockers, to slow heart rate and lower blood pressure, are used unless there is evidence of heart block, heart failure, or active wheezing. Morphine is used for refractory pain and breathlessness. Heparins are used for pain that does not resolve with initial treatments. Persistent symptoms, ECG changes, or elevated cardiac enzymes suggest an acute coronary syndrome and may require further treatments (see above under Acute Myocardial Infarction). The patient with new or unstable angina is usually admitted to the hospital for further studies and stabilization.

Emergency Situations (Continued)

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Arterial bleeding	Trauma to blood vessels; surgery; erosion of arteries by ulcers, infection, or cancer.	Blood that spurts out in pulsatile fashion from a vessel is characteristic of bleeding from an artery. (Blood that oozes from a vessel continuously is characteristic of bleeding from a vein.)	Arterial bleeding from a vessel in an arm or leg can often be controlled with pressure applied directly over the bleeding vessel or just proximal to it. Arterial ligation may be performed surgically if direct pressure does not limit blood loss. Arterial bleeding from peptic ulcers is typically controlled with the injection of sclerosing agents during endoscopy or with electrocoagulation or coaption. Bleeding from other internal vessels may also be controlled endoscopically (e.g., bleeding from bronchial arteries during bronchoscopy). In some instances, blood flow through internal arteries can be stopped with therapeutic embolization.

Asthma	Episodic bronchospasm, caused by exposure to allergens (such as pollens), smoke, pollutants, cold air, exercise, or other triggers of airway inflammation.	Difficulty breathing, wheezing, and chest tightness. Patients are often able to identify the triggering event. They may report that their inhalers are not providing adequate relief. Physical findings include tachypnea, tachycardia, and labored breathing, often with a prolonged expiratory phase and wheezing. Cyanosis of the fingers or the lips suggests inadequate oxygenation. Patients may be agitated, frightened, or, in severe attacks, lethargic or comatose.	Supplemental oxygen should be supplied, and the patient should be given inhaled bronchodilators (e.g., albuterol and ipratropium). Oral or intravenous steroids are used to reduce airway inflammation. Epinephrine may be injected subcutaneously in severe asthma; antibiotics are used when there is evidence or suspicion of a bacterial infection. Severe asthma may result in respiratory failure and the need for ventilatory support (e.g., noninvasive ventilation or tracheal intubation).
Chronic Obstructive Pulmonary Disease (COPD), exacerbation of	An acute or gradual worsening of pulmonary function in patients with chronic lung disease, typically brought on by a viral or bacterial infection, or by congestive heart failure, allergies, pulmonary emboli, or the rupture of an emphysematous bleb at the margins of the lung.	Patients typically report increased shortness of breath, cough, sputum production, and fevers, and appear to labor more than usual to breathe. Tachypnea, tachycardia, and hypoxemia or carbon dioxide retention are often present. Breath sounds may be distant, or wheezing may be present.	Oxygen is supplied, and the patient is carefully monitored clinically. Continuous oximetry should be used, and arterial blood gases checked when there is clinical suspicion of impending respiratory failure. Bronchodilators (such as albuterol and ipratroprium) are given by inhalation. Corticosteroids are used to reduce airway inflammation. Antibiotics are used when there is evidence or suspicion of a bacterial infection. Severe exacerbations may result in respiratory failure and the need for ventilatory support (e.g., noninvasive ventilation or tracheal intubation).

Emergency Situations (Continued)

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Cold-induced soft tissue injury (frostnip, chilblain, frostbite)	*Frostnip:* superficial, reversible injury caused by ice crystal formation on the surface of the skin. *Chilblain:* superficial injury caused by exposure to cold, humid air. Tissue does not freeze. *Frostbite:* destruction of tissue by freezing. The extent of tissue loss reflects the duration of cold exposure and the magnitude of temperature depression.	*Frostnip:* usually, paresthesias, pain, and numbness. *Chilblain:* redness, itching, numbness, burning, and pain. *Frostbite:* similar to chilblain. Frostbitten skin may be waxy and white or mottled and cyanotic. The frozen part will have no sensation. Surrounding tissue may be painful and tender. As the tissue thaws its appearance changes. In partial-thickness frostbite the skin becomes red and warm. Blisters containing clear fluid may appear. In full-thickness frostbite the blisters contain a bloody fluid. There is no sensation in full-thickness frostbite.	Initial treatment involves removing the patient from the cold environment. Concomitant hypothermia is a hazard. The frozen parts should not be rewarmed if there is danger of refreezing. Rapid rewarming should be performed by soaking the injured part in warm water (42°C). Rubbing or other manipulation of frozen tissue may worsen the injury. Further treatment may be needed for more serious injuries.

Congestive heart failure (CHF)	An impairment in the ability of the heart to move blood into the systemic circulation, either because of damage to heart muscle (e.g., after a heart attack), failure of the heart muscle to relax properly, pericardial restriction, valvular heart disease, or other causes.	Most patients are winded with exertion, and some are short of breath at rest. Many cannot lie flat in bed at night because the supine position makes them breathless. Lower extremity and sacral swelling are common, along with ascites, liver enlargement, and elevated jugular veins. Crackles or wheezes may be heard in the lung bases or throughout the lungs in left ventricular CHF. The patient is often hypoxemic. Chest x-rays may show an enlarged heart with fluffy infiltrates near the hila. BNP levels are high.	Oxygen, potent diuretics, morphine sulfate, nitroglycerin, nesiritide, and ACE inhibitors may be used to manage CHF or acute pulmonary edema as long as the patient is not hypotensive. Hypotensive patients may be treated with dobutamine, combinations of dopamine and nitroprusside, or other drugs and interventions.
Fractures and Dislocations	Most fractures and dislocations are caused by significant trauma, e.g., automobile collisions, falls, or sports injuries. Fractures that occur without a powerful mechanism of injury are termed "pathological." They may occur in patients with underlying malignancies that have spread to bone or in patients with osteoporosis.	Limb fractures or joint dislocations are often clinically obvious. The affected limbs are usually swollen, visibly deformed or rotated, and exquisitely painful to gentle touch or any movement. Patients with rib fractures may complain of pain on breathing or coughing. The injured chest wall is tender and may be bruised. Patients with fractures of the vertebral bodies (or patients suspected of having vertebral fractures) often complain of neck, thoracic, or lumbar pain after a fall or automobile accident. X-rays of the affected bones confirm the diagnosis.	Primary treatment includes immobilization (splinting) of any affected bones or joints until diagnostic x-rays can be obtained. Analgesics are given as required, and cold packs or ice are applied to limit pain and inflammation. Limb fractures or dislocations are sometimes amenable to immediate treatment with closed reduction, although operative reductions and placement of fasteners may be needed to obtain optimal healing. Patients suspected of having vertebral fractures should be placed in firm cervical collars or restrained on spinal boards until examination and x-rays clearly demonstrate that the spine is stable.

Emergency Situations (Continued)

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Gastrointestinal (GI) bleeding	Upper gastrointestinal bleeding often results from esophagitis, esophageal tears, gastritis, peptic ulcer disease, esophageal varices, or vascular malformations. Lower GI bleeding typically is caused by hemorrhoids, anal fissures, diverticuli, vascular malformations, or cancers.	The rapidly bleeding patient may present in shock (i.e., dizzy on arising, hypotensive, tachycardic, cool, clammy, diaphoretic, and confused). Bleeding from the upper GI tract often reveals itself when the patient vomits bright red blood or digested blood that resembles coffee grounds. Occasionally, bleeding from the upper tract is so vigorous that it causes the loss of bright red blood from the rectum. Usually, however, this is a finding in lower GI bleeding. Digested blood that is expelled in the feces is typically black and tarry (melenic).	Patients with significant blood loss are treated immediately with intravenous fluids. Blood is obtained for typing and crossmatching, and transfusions are given when indicated. Upper GI bleeding resulting from peptic ulcer disease, esophagitis, or gastritis may respond to treatment with IV or oral proton pump inhibitors. The loss of bright red blood from the upper GI tract should be promptly evaluated with esophagogastroduodenoscopy (EGD). Patients with a bleeding ulcer vessel or esophageal varices may be treated with endoscopic therapies to cauterize or band bleeding vessels or with medical therapies including agents such as octreotide. Patients suspected of having lower GI blood loss are evaluated with colonoscopy, e.g., to identify arteriovenous malformations, cancers, diverticuli, or ulcerative colitis.

Hyperglycemia	Elevated blood glucose are usually caused by impairments in glucose metabolism (type 1 or type 2 diabetes mellitus, gestational diabetes mellitus, or drugs or infections that temporarily predispose patients to high blood glucose levels). In diabetics sudden elevations of blood glucose are typically caused by failure to maintain a careful dietary and medical regimen, taking medications such as coticosteroids, or serious ilnesses (e.g., infections, heart attack, stroke).	Patients often report thirst, frequent urination, increased appetite, and increased consumption of fluids. Those who become dehydrated may be dizzy when they get up from a bed or chair. Blood chemistries typically reveal a blood glucose of more than 200 mg/dl, and glucose is present in the urine.	Fluids are administered by mouth (if possible) and intravenously. Insulin or oral hypoglycemic agents are given.
Hyperthermia (heat cramps, heat exhaustion, heatstroke)	Inability of the body to cope with heat stress resulting from excessive heat production or decreased heat loss. *Heat cramps:* muscle cramps and fatigue accompanied by water and mild salt depletion. *Heat exhaustion:* serious dehydration with water and electrolyte depletion. Patients maintain thermoregulatory control. Heat exhaustion may progress to *heatstroke,* characterized by thermoregulatory failure and profound dehydration.	The person with heat cramps complains of painful muscle spasms. There is a history of recent exertion in a hot environment. The patient has been sweating profusely with inadequate or hypotonic fluid replacement. The patient with heat exhaustion has also been sweating in a hot environment. Symptoms include thirst, weakness, fatigue, vomiting, and anorexia. The skin is cool and clammy. Body temperature may be normal or subnormal. The heatstroke victim will have an altered mental status and will be tachycardic, hypotensive, hyperthermic, and tachypneic. Signs of dehydration will be present.	First aid begins with removal of the patient from the hot environment. Heat cramp victims are treated with an oral or intravenous fluid and electrolyte solution. Heat exhaustion is treated by intravenous fluids. Patients with severe dehydration may require more than 4 L of IV fluid. Patients with heatstroke require rapid cooling. Many techniques are available, but evaporation with water is practical and effective. The patient may be sprayed with water and fanned until the core temperature is about 38.5°C. Cooling beyond this may cause overshoot hypothermia. IV fluid resuscitation as for heat exhaustion is also needed.

Emergency Situations (Continued)

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Hypoglycemia	The most frequent causes are an excessive dose of insulin or an oral hypoglycemic agent, or inadequate food intake by a diabetic patient treated with those drugs (e.g., during an illness that causes anorexia, nausea, or vomiting). Low blood sugars deprive the brain and other organs of the glucose they need for normal metabolism.	Mental status may vary from confused to agitated to unconscious. The patient is often sweaty, tremulous, and tachycardic. Occasionally, hypoglycemia may mimic strokes or seizures.	Glucose or dextrose should be given immediately—intravenously if the patient is unable to safely eat, orally if the patient is conscious and sufficiently oriented. One mg of glucagon, administered by intramuscular injection, is an alternative. Blood sugar levels should be tested with a glucometer. Hospitalization may be necessary if the patient has taken an overdose of long-acting insulin or an oral antihyperglycemic agent.
Hypothermia	Core temperature less than 35°C (95°F), caused by decreased heat production, increased heat loss, or impaired temperature regulation. Exposure to cold or wet conditions, sepsis, or profound hypothyroidism may be predisposing conditions. Central nervous system, cardiovascular, and respiratory systems are impaired when the temperature is below 35°C.	Lethargy, confusion, and fatigue in mild cases. Heart rate and respiratory rate may be increased. As hypothermia worsens, the patient stops shivering. Heart rate, blood pressure, and respirations slow. The patient eventually loses consciousness. Respirations and pulses may be difficult to detect.	Cold or wet clothing should be removed. The patient should be rewarmed. Warm blankets, warm oxygen, and warm IV fluids may be used. An accurate core temperature must be recorded, if possible. Temperatures less than 32°C may require more aggressive rewarming techniques, such as gastric lavage, peritoneal lavage, hemodialysis, or cardiopulmonary bypass. If pulses are absent, cardiopulmonary resuscitation is indicated.

Seizure	An abnormal electrical discharge by central nervous system neurons that produces autonomic, behavioral, motor, or sensory abnormalities. Seizures may result from structural diseases of the brain (e.g., arteriovenous malformations, strokes, trauma, or tumors), from metabolic disorders (e.g., severe electrolyte disorders, low blood sugars, renal failure, or hypoxia), or from drugs (or drug or alcohol withdrawal).	During a generalized motor seizure, the patient is unconscious and has repetitive back-and-forth movements of the upper and lower extremities. Patients may bite the tongue, lose control of the bowels or bladder, or injure themselves when they fall. After the seizure, there is usually a period of gradual and progressive return to normal consciousness, which may take 30 to 60 min. Some patients may have a brief period of focal paralysis after the event.	During the seizure, the patient should be guarded against injury. This may involve helping the patient to the floor and moving furniture out of the way. Supplemental oxygen should be given. Objects should not be inserted into the patient's mouth—an obstructed airway may result. Medications such as lorazepam, diazepam, fosphenytoin, or phenobarbital may be used to abort the seizure. Most seizure patients will require some investigation into the cause of the seizure. In patients with a history of prior seizures, this may include checking blood levels of anticonvulsant medications. Patients with first-time seizures may need a more extensive evaluation, including a CT scan, an EEG, MRI, blood work, and a lumbar puncture.

Emergency Situations (Continued)

Medical Emergency	*Underlying Causes*	*Findings*	*Treatment*
Stroke (cerebrovascular accident)	Inadequate blood flow to an area of the brain causing tissue death. In thrombotic stroke, blood vessels narrowed by atherosclerosis limit delivery of oxygenated blood to the brain or a portion of it. In embolic stroke, clots travel from other areas of the body to block cerebral vessels. Hemorrhagic stroke results from bleeding caused by hypertension or rupture of cerebral aneurysms.	Patients often present with weakness or numbness on one side of the body or the face; with speech disturbances; or with confusion, clumsiness, difficulty walking, loss of consciousness, or coma.	Oxygen is administered and cardiac monitoring is begun. A computed tomographic (CT) scan of the brain is used to rule out a hemorrhage as a cause of new neurological deficits. Tissue plasminogen activator (a thrombolytic, or "clot-busting" drug) may be given to patients who present in the first 3 hr of nonhemorrhagic stroke.
Suicidal ideation	Major depression; alcohol abuse; dysphoria; adjustment disorders; borderline personality disorders; psychotic disorders; poor social situations and recent stressful events. Older men living alone are most likely to use lethal means to harm or kill themselves. Younger persons are most likely to come to an emergency department in distress.	Patients may report feelings of hopelessness, misery, anxiety or tension, or may feel that life has lost its meaning or joy. People who have taken medications in an attempt to overdose may have signs and symptoms related to the ingested drug(s) and may need inpatient stabilization. Consult Appendix 12–1.	Hospitalization is indicated for patients who are intoxicated by drug or alcohol overdose or who have a concrete plan to take their own lives. Outpatient therapy may be appropriate for people without the means to use potentially lethal drugs or devices to jeopardize their health and safety. Antidepressant medications, counseling, alcohol and drug rehabilitation therapies, and psychiatric consultation are used individually or in combination for selected suicidal patients.

Thermal burns	*First- and second-degree burns:* partial-thickness injuries involving only the epidermis or the epidermis and dermis. *Third-degree burns:* full-thickness injuries involving the deeper tissues. Burns impair the skin's ability to prevent heat and water loss. Burned skin is not an effective barrier to injection. Severity depends on the character and temperature of the agent, the duration of exposure, and the type of skin injured.	*First-degree burns:* red and painful. *Second-degree burns:* red, painful, and weeping. These burns heal without scarring. *Third-degree burns:* may be white or charred. The subcutaneous nerves have been destroyed; thus there is no pain. Surrounding areas are painful. Full-thickness burns heal poorly, leaving a scar.	The first step is to stop the burning process. Oxygen should be administered if there has been smoke inhalation. Jewelry and clothing should be removed in anticipation of swelling. Sterile sheets or dressings should be applied to the burned areas.
Transient ischemic attack (TIA)	See *Stroke*.	Symptoms and signs are similar to those of a stroke, but usually last less than 1 or 2 hr.	Patients with TIAs are treated with antiplatelet therapies, such as aspirin or clopidogrel, and are evaluated with electrocardiographic monitoring (e.g., to rule out atrial fibrillation), CT scans of the head (to rule out small strokes), and carotid ultrasonography (to determine whether the patient has a surgically correctable stenosis of the carotid arteries).

APPENDIX 13

Health Professions

Health Profession	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Anesthesiology	Anesthesiologist assistant (AA)	Assists the anesthesiologist in developing and implementing an anesthesia care plan, functioning as physician assistant.	American Academy of Anesthesiologist Assistants; Tallahassee, FL (850) 656-8848; www.anesthetist.org		National Commission for Certification of Anesthesiologist Assistants (NCCAA)	Two years beyond bachelor's degree
Art Therapy	Art therapist	Uses drawings and other art/media forms to assess, treat, and rehabilitate patients with mental, emotional, physical, and/or developmental disorders.	American Art Therapy Association (AATA); Mundelein, IL (888) 290-0878; arttherapy.org	ATR (Registered Art Therapist), ATR-BC (Board-Certified Art Therapist)	Art Therapy Credentials Board (ATCB); (877) 213-ATCB; www.atcb.org	master's degree
Athletic Training	Athletic trainer (AT)	Provides services including injury prevention, recognition, immediate care, treatment, and rehabilitation after physical trauma, with the consultation and supervision of attending and/or consulting physicians, in such healthcare settings as secondary schools, colleges, sports medicine clinics, and professional sports programs.	National Athletic Trainers' Association (NATA); Dallas, TX (214) 637-6282; www.nata.org	ATC (Athletic Trainer, Certified), LAT (Licensed Athletic Trainer), LATC (Licensed Athletic Trainer, Certified)	NATA Board of Certification; (402) 559-0091; www.bocatc.org	bachelor's degree

Audiology and Speech-Language Pathology	Audiologist	Diagnoses and treats hearing and balance problems, determining whether a patient's problem is medical or nonmedical in nature and prescribing a treatment plan that incorporates a hearing aid or other assistive devices.	Academy of Dispensing Audiologists; Columbia, SC (800) 445-8629; audiologist.org	CCC-A (Certificate of Clinical Competence in Audiology)		doctorate in Audiology (Au.D) or a master's degree or doctorate from an accredited university graduate program plus clinical fellowship
Audiology and Speech-Language Pathology	Speech-language pathologist	Assesses, diagnoses, treats, and helps to prevent speech, language, cognitive, communication, voice, swallowing, fluency, and other related disorders. Works with people who cannot make speech sounds, or cannot make them clearly; those with speech rhythm and fluency problems, such as stuttering; people with voice-quality problems; those with problems understanding and producing language; those who wish to modify an accent; and those with cognitive communication impairments, such as attention, memory, and problem-solving disorders.	American Speech-Language-Hearing Association (ASHA); Rockville, MD (800) 498-2071; www.asha.org	CCC-SLP (Certificate of Clinical Competence in Speech-Language Pathology)	ASHA Clinical Certification Board	master's degree

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Blindness and Visual Impairment Professions	Low vision specialist/ therapist	Is licensed to examine, diagnose, and treat various ocular conditions and visual impairments not fully treatable by medical or surgical means or by conventional eyewear or contact lenses.	Association for Education and Rehabilitation of the Blind and Visually Impaired (AERBVI); Alexandria, VA (703) 671-4500; www.aerbvi.org Low vision gateway; www.lowvision.org			doctorate in optometry or ophthalmology
Blindness and Visual Impairment Professions	Orientation and mobility specialist	Trains individuals to restore orientation and mobility skills to the legally blind and visually impaired; provides appropriate assessments, individualized instruction, family support, progressional consultation and collaboration, and community education.	AERBVI	Certification from the Academy for the Certification of Vision Rehabilitation and Education Professionals	National Certification from the Association for Education and Rehabilitation of the Blind and Visually Impaired (AER); (703) 671-4500; www.aerbvi.org	bachelor's or master's degree
Blindness and Visual Impairment Professions	Rehabilitation teacher	Teaches independent living skills, activities of daily living, homemaking skills, and personal management to the blind and visually impaired; also teaches how to communicate using Braille and assistive technology.	Careers in Vocational Rehabilitation; www.rehabjobs.org		Association of Educators and Rehabilitators of the Blind and Visually Impaired (AER); (703) 548-1884	

Blood Bank Technology	Blood bank technology specialist; Specialist in blood bank technology (SBB)	Carries out all operations of the blood bank, from routine testing of the blood type compatibility to the management and supervision of the reference lab.	American Society of Clinical Pathologists; Chicago, IL (312) 738-1336; www.ascp.org; American Society for Clinical Pathology; Chicago, IL	SBB (Certified as a Specialist in Blood Banking Technology)	American Association of Blood Banks (AABB); www.aabb.org, American Society of Clinical Pathologists (ASCP) Board of Registry (BOR) in collaboration with the AABB	Successful completion of an accredited SBB Program
Cardiovascular Technology	Cardiovascular Technologist	Assists physicians in diagnosing and treating cardiac and peripheral vascular ailments; administers noninvasive cardiovascular examinations; assists in invasive cardiology studies.	Society for Vascular Ultrasound; Lanham, MD (301) 459-7550; www.svunet.org; American Society of Electrocardiography (919) 787-5181; Society of Invasive Cardiovascular Professionals; Raleigh, NC (919) 861-4546; www.sicp.com		Cardiovascular Credentialing International (CCI); (800) 326-0268; www.cci-online.org	Two- to four-year program
Clinical Laboratory Science	Clinical assistant	Follows standard operating procedures to collect specimens and prepare blood and body fluid specimens for analysis, and performs appropriate tests with a laboratory focus.	American Society for Clinical Laboratory Science (ASCLS); Bethesda, MD (301) 657-2768; www.ascls.org		National Certification Agency for Medical Laboratory Personnel (NCAMLP); (913) 438-5110; www.nca-info.org	Clinical assistant program (post-secondary certificate); high-school diploma or equivalent required

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Clinical Laboratory Science	Cytogenetic technologist	Studies the morphology of chromosomes and their relationship to disease; and evaluates the correct method of collection, transport, and handling of various specimen types for cytogenetic analysis.	ASCLS		NCAMLP	bachelor's degree plus one year certificate program
Clinical Laboratory Science	Diagnostic molecular scientist	Performs diagnostic assay or testing using a variety of manual techniques and precision instruments; also researches, evaluates, implements, and monitors methods of collection, transport, and handling of various specimen types.	ASCLS			bachelor's degree; programs usually lead to master's degree
Clinical Laboratory Science	Histotechnician/Histotechnologist	Prepares sections of body tissue for examination by a pathologist, including the preparation of tissue specimens of human and animal origin for diagnostic, research, or teaching purposes. Other duties include identifying tissue structures, cell components, and their staining characteristics, and instituting proper procedures to maintain accuracy and precision.	ASCLS; American Society for Clinical Pathology; Chicago, IL (312) 738-1336; www.ascp.org		National Accrediting Agency for Clinical Laboratory Sciences (NAACLS); (773) 714-8880; www.naacls.org	Twelve-month program; high-school diploma or equivalent required

Clinical Laboratory Science	Medical laboratory technician (MLT); Clinical laboratory technician	Performs general tests in all laboratory areas: blood banking, chemistry, hematology, immunology, and microbiology. Working under a medical technologist, an MLT hunts for clues related to the absence, presence, extent, and causes of diseases.	ASCLS; American Society for Clinical Pathology (ASCP); Chicago, IL (312) 738-1336; www.ascp.org	NAACLS	associate's degree or 12-month program/certificate
Clinical Laboratory Science	Medical technologist (MT); Clinical laboratory scientist	Performs a full range of laboratory tests to detect such diseases as AIDS, diabetes, and cancer. The MT is also responsible for confirming the accuracy of test results and reporting laboratory findings.	ASCP	NAACLS	bachelor's degree plus clinical education in a medical technology program accredited by the NAACLS
Clinical Laboratory Science	Pathologists' assistant	Participates in autopsies and in the examination, dissection, and processing of tissue specimens.	ASCLS (see above); The American Association of Pathologists' Assistants (AAPA); Roseville, MN (800) 532-AAPA; www.pathologists-assistants.org	National Commission on Certification of Pathologists' Assistants	bachelor's or master's degree
Clinical Laboratory Science	Phlebotomist	Collects, transports, handles, and processes blood specimens for analysis; identifies and selects equipment, supplies, and additives used in blood collection; and understands factors that affect specimen collection procedures and test results.	ASCLS (see above). The Center for Phlebotomy Education; Ramsey, IN (812) 633-4636; www.phlebotomy.-com	American Medical Technologists; (847) 823-5169; www.amt1.com, American Society for Clinical Pathology; (312) 738-1336; www.ascp.org	Post-secondary certificate; high-school diploma or equivalent required

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Counseling-related Professions	Community counselor; Marriage and family counselor/therapist; Mental health counselor; School counselor; Student affairs practitioner		American Counseling Association (ACA); Alexandria, VA (703) 823-9800; www.counseling.org		National Board for Certified Counselors (NBCC); (336) 547-0607; www.nbcc.org	bachelor's or master's degree
Counseling-related Professions	Community counselor	Assists people to become more socially integrated and functionally independent by helping them manage disabilities and occupational and vocational needs.	ACA		NBCC	bachelor's or master's degree
Counseling-related Professions	Marriage and family counselor/therapist	Diagnoses and manages behavioral, emotional, and psychological problems that arise in families.	ACA; American Association for Marriage & Family Therapy (AAMFT); Alexandria, VA (703) 838-9808; www.aamft.org		NBCC, state licensing exam, or the national examination for marriage and family therapists conducted by the AAMFT Regulatory Boards	master's degree or doctorate + 2 years clinical experience

Counseling-related Professions	Mental health counselor	Evaluates, treats, and manages interpersonal psychological issues, including interpersonal crises, suicidality, adjustment and mood disorders, alcoholism, and substance abuse.	ACA; American Mental Health Counselors Association (AMHCA); Alexandria, VA (703) 548-6002; www.amhca.org	National Board for Certified Counselors (NBCC); (336) 547-0607; www.nbcc.org	
Counseling-related Professions	School counselor	Helps students evaluate their abilities, interests, talents, and personality characteristics in order to develop realistic academic and career goals. Operates career information centers and career education programs. High school counselors help to prepare students for college and trade or technical schools and apprenticeship programs. Elementary school counselors observe younger children during classroom and play activities, confer with their teachers and parents, and carry out evaluations. School counselors at all levels help students deal with social, behavioral, and personal problems.	ACA; American School Counselor Association (ASCA); Alexandria, VA (703) 683-ASCA; www.school-counselor.org	NBCC	The Council for Accreditation of Counseling and Related Educational Programs (CACREP) accredited program

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Dental-related Occupations	Dental assistant	Assists the dentist in a wide variety of procedures and functions, including infection control, practice management, preventive dentistry, and radiology.	American Dental Association (ADA); Chicago, IL (312) 440-2500; www.ada.org; American Dental Assistants Association (ADAA); Chicago, IL (312) 541-1550; www.dental-assistant.org	CDA (Certified Dental Assistant)	Dental Assisting National Board (DANB); (312) 642-3368; www.dental-assisting.com, American Medical Technologists offers a Registered DA certificate — www.amt1.com	Academic programs at community colleges, vocational schools, technical institutes, universities, or dental schools. Graduates of these programs usually receive certificates.
Dental-related Occupations	Dental hygienist	Performs a wide range of professional oral health assessments and treatments. Provides prophylaxis and treatment of dental and gum diseases; makes, develops, and interprets dental x-rays; screens patients for oral cancer; educates patients about dental health.	ADA; American Dental Hygienist Association; Chicago, IL; www.adha.org	RDH (Registered Dental Hygienist) [state licensure]	National Board Dental Hygiene Examination	associate's degree; bachelor's or master's degree
Dental-related Occupations	Dental laboratory technician	Works with dentists to create dental impressions, bridges, crowns, dentures, implants, splints, and other dental appliances.	American Dental Association (ADA); Chicago, IL (312) 440-2500; www.ada.org;	CDT (Certified Dental Technician)	National Board for Certification in Dental Laboratory Technology (NADL); (800) 950-1150; www.nadl.org	Two-year program certificate; associate's degree

Diagnostic medical sonography	Diagnostic medical sonographer	Uses ultrasonic technologies to image, study, and reveal internal structures of healthy and diseased patients, in clinical, research, and therapeutic settings.	Society of Diagnostic Medical Sonography; Plano, TX (972) 239-7367; www.sdms.org	RDMS (Registered Diagnostic Medical Sonographer), RDCS (Registered Diagnostic Cardiac Sonographer), RVT (Registered Vascular Technologist), ROUB (Registered Ophthalmic Ultrasound Biometrist)	American Registry of Diagnostic Medical Sonographers (ARDMS); (800) 541-9754; www.ardms.org	Programs vary from one to four years depending on the degree or certificate awarded. Prerequisites also vary among programs from high-school diploma or GED to specific qualifications in a related allied health profession.
Dietetics	Dietician/ Nutritionist	Assesses, educates, and manages patients with special nutritional needs, managing food operations (including preparation and purchasing), and promoting nutritional health in health care and other institutional settings.	American Dietetic Association (ADA); Chicago, IL (312) 899-0040; www.eatright.org	RD (Registered Dietican) [certifications in specialized areas of practice, such as pediatric or renal nutrition, nutrition support, and diabetes education, are available, but not required]	Commission on Dietetic Registration (CDR), (312) 899-0040; www.cdrnet.org	bachelor's degree
Dietetics	Dietetic technician	Helps dietician prepare menus, guarantee food safety, educate patients, and oversee the management of food operations, among many other functions.	ADA	DTR (Dietetics Technician, Registered)	CDR	associate's degree

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Electroneurodiagnostic Technology (END)	Electroneurodiagnostic technologist	Works in collaboration with the electroencephalographer or neurologist to take patient histories, perform and interpret EEGs, EPs, and sleep studies, and educate patients, among other functions.	American Society of Electroneurodiagnostic technologists (ASET); Kansas City, MO (816) 931-1120; www.aset.org	R EEG T (Radiologic Electroencephalography Technologist)	American Board of Registration of Electroencephalographic and Evoked Potential Technologists (ABRET); (217) 553-3758; www.abret.com	high-school diploma or equivalent to enter an accredited program; The Board of Trustees of ASET, has adopted the position that by 2005, any individual entering the END profession must have earned an associate's degree or higher and have successfully completed a reviewed and accredited program.
Emergency Medical Services	Emergency medical technician-paramedic	Provides emergency care to patients with acute medical, psychological, or surgical illnesses. Transports patients to health care facilities for specialized care.	National Association of Emergency Medical Technicians; Clinton, MS (601) 924-7744; www.naemt.org	EMT-B (Emergency Medical Technician— Basic), EMT–I (Emergency Medical Technician—Intermediate), EMT-P (Emergency Medical Technician—Paramedic)		high-school diploma + EMT program

Genetic Counseling	Genetic counselor	Assesses and diagnoses inherited illnesses. Educates, advocates for, and supports patients and families.	National Society of Genetic Counselors (610) 872-7608; www.nsgc.org		American Board of Genetic Counseling (ABGC); (301) 634-7316; www.abgc.net	bachelor's degree
Health Information Management	Health information administrator	Collects, interprets, manages, and analyzes patient data. Interacts with all levels of an organization—clinical, financial, administrative;—that employ patient data in decision making and everyday operations.	American Health Information Management Association (AHIMA); Chicago, IL (312) 233-1100; www.ahima.org	RHIA (Registered Health Information Administrator)	American Health Information Management Association (AHIMA); (312) 233-1100, www.ahima.org	associate's or bachelor's degree
Health Information Management	Health information technician	Ensures the quality of medical records by verifying their completeness, accuracy, and proper entry into computer systems. May use computer applications to assemble and analyze patient data. Often specializes in coding diagnoses and procedures in patient records for reimbursement and research.	AHIMA; Healthcare Information and Management Systems Society (HIMSS); Chicago, IL (312) 664-4467; www.himss.org	RHIT (Registered Health Information Technician)	AHIMA	associate's degree
Health Unit Coordination	Health Unit Coordinator	Performs administrative and clerical tasks that keep hospital and medical offices operating efficiently. Maintains integrity of medical records; schedules appointments, tests, and studies; transcribes doctor's orders; uses clinical software; keeps clinical and administrative supplies stocked; communicates with health care professionals.	National Association of Health Unit Coordinators, Inc.; Rockford, IL (888) 22-NAHUC; www.nahu.org	CHUC (Certified Health Unit Coordinator)	NAHUC Certification Board; (888) 22-NAHUC	high-school diploma or GED

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Kinesiotherapy	Kinesiotherapist	Uses exercise and education to enhance patient mobility, increase endurance, maximize physical flexibility and strength, and optimize patient function.	American Kinesiotherapy Association; Hines IL (800) 296-2582; www.akta.org		Board of Registry for Kinesiotherapy; (419) 530-2731;	bachelor's degree
Massage Therapy	Massage therapist	Manipulates and mobilizes soft tissues to alleviate pain and improve function.	American Massage Therapy Association; Evanston, IL (847) 864-0123; www.amtamassage.org	NCTMB (Nationally Certified in Therapeutic Massage and Bodywork)		high-school diploma + training program
Medical Assisting	Medical assistant	Performs a wide variety of clinical and administrative functions under the direction of nurses, physicians, and other health care providers. Clinical functions may include infection control, taking vital signs, and performing diagnostic tests. Administrative functions may include scheduling patients, maintaining medical records, and performing medical transcription.	American Association of Medical Assistants (AAMA); Chicago, IL (800) 228-2262; www.aama-ntl.org; American Medical Technologists; Park Ridge, IL (847) 823-5169; www.amt1.com	CMA (Certified Medical Assistant), CMA-A (Certified Medical Assistant—Administrative), CMA-C (Certified Medical Assistant— Clinical), RMA (Registered Medical Assistant)	American Association of Medical Assistants (AAMA); (800) 228-2262; www.aama-ntl.org	high-school diploma or equivalent + accredited MA program

Medical Coding	Medical coder	Abstracts medical data from patient records, e.g., to optimize reimbursement, or to obtain information for governmental, research, or administrative purposes.	American Health Information Management Association (AHIMA); www.ahima.org; Association of Registered Medical Professionals (ARMP); www.medword.com	CCA (Certified Coding Associate — entry-level), CCS (Certified Coding Specialist), CCS-P (certified coding specialist – physician-based)		high-school diploma
Medical Dosimetry	Medical dosimetrist	Works with the medical physicist and radiation oncologist to design treatment plans in radiation oncology by calculating and generating radiation doses. Helps to manage tumor localization and patient immobilization. Manages procedures employed in brachytherapy.	American Association of Medical Dosimetrists; College Park, MD (301) 209-3320; www.medical-dosimetry.org		Medical Dosimetrist Certification Board (MDCB); (866) 813-6322; www.mdcb.org	associate's or bachelor's degree; dosimetry program (18 months)
Medical Illustration	Medical illustrator	Creates visual representations of anatomical, biochemical, cellular, or clinical data to inform readers and disseminate knowledge.	Association of Medical Illustrators; Atlanta, GA (719) 598-8622; www.ami.org	CMI (Certified Medical Illustrator)	The Board of Certification of Medical Illustrators; (719) 598-8622	bachelor's degree; medical illus. programs usually yield a master's degree
Medical Transcription	Medical transcriptionist	Interprets and transcribes dictated medical records so that they may be accurately and faithfully recorded in the patient's chart. Edits dictation for grammar and clarity. May work with a variety of editing tools, including software programs that facilitate word processing or speech recognition.	American Association for Medical Transcription (AAMT); Modesto, CA (800) 982-2182; www.aamt.org	CMT (Certified Medical Transcriptionist)	Medical Transcription Certification Commission at AAMT	high-school diploma

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Music Therapy	Music therapist	Uses music to assess, manage, and treat emotional, medical, psychological and social problems of individuals and groups; assesses and stimulates communication and creativity through composition, improvisation, listening, and performance. Integrates music into interdisciplinary care plans.	American Music Therapy Association; Silver Spring, MD (301) 589-3300; www.music-therapy.org	RMT (Registered Music Therapist), CMT (Certified Music Therapist), ACMT (Advanced Certified Music Therapist)	Certification Board for Music Therapists (CBMT); (800) 765-CBMT; www.cbmt.org	bachelor's degree
Nuclear Medicine Technology	Nuclear medical technologist	Works with nuclear medicine physicians to prepare and administer radioactive chemical compounds. Performs imaging procedures in clinical and research settings using sophisticated image processing equipment. Analyzes imaging data used in diagnostic studies.	Society of Nuclear Medicine — Technologist Section; Reston, VA (703) 708-9000; www.snm.org		Nuclear Medicine Technology Certification Board, (404) 315-1739; www.nmtcb.org	high-school diploma required; programs yield associate's or bachelor's degree

Occupational Therapy	Occupational therapist (OT)	Helps people live independent, fulfilling, and socially productive lives by improving their ability to function at home, in the community, and on the job. Assesses functional deficits (medical, psychological, traumatic, etc.) and devises treatment plans to help people uncover, recover, develop, or optimize skills needed to make work and daily living accessible, efficient, enriching, and satisfying.	American Occupational Therapy Association (AOTA); Bethesda, MD (301) 652-2682; www.aota.org	OTR (Registered Occupational Therapist)	National Board for Certification in Occupational Therapy (NBCOT); (301) 990-7979; www.nbcot.org	bachelor's or master's degree; doctorate
Occupational Therapy	Occupational therapy assistant; Occupational therapy aide	Works as supervised by occupational therapists to help rehabilitate people with cognitive, developmental, physical, and psychological needs.	AOTA	COTA (Certified Occupational Therapy Assistant)	OTA	associate's degree or 1 year certificate program

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Ophthalmic Dispensing Opticianry	Ophthalmic dispensing optician	Fits eyeglasses and contact lenses, following prescriptions written by ophthalmologists or optometrists. Examines written prescriptions to determine lens specifications. Recommends eyeglass frames, lenses, and lens coatings after considering the prescription and the customer's occupation, habits, and facial features. Dispensing opticians measure customer's eyes, including the distance between the centers of the pupil. For customers without prescriptions, dispensing opticians may use a lensometer to record the present eyeglass prescription. They also may obtain a customer's previous record, or verify a prescription with the examining optometrist or ophthalmologist.	American Board of Opticians (703) 719-5800; American Board of Opticianry/ National Contact Lens Examiners; Springfield, VA (703) 719-5800; www.abo-ncle.org; Opticians Association of America (OAA); Reston, VA (800) 443-8997; www.oaa.org	ABOC, (ABO Certification), ABOC-AC (ABO-Advanced Certification), NCLC (NCLC Certification), NCLE-AC (NCLC-Advanced Certification), ABOM (ABO-Master)	The American Board of Opticianry (ABO)/National Contact Lens Examiners (NCLE); (703) 719-5800; www.abo-ncle.org	high-school diploma or equivalent
Ophthalmic Laboratory Technology	Ophthalmic laboratory technician	Cuts, grinds, edges, and finishes lenses and fabricates eyewear. Duties include transposing prescriptions, selecting appropriate lens forms, and processing materials to meet the prescription.	OAA			high-school diploma

Ophthalmic Medical Technology	Ophthalmic medical technician/ technologist	Collects patient information, and performs eye examinations as ordered by ophthalmologists. Performs the duties of the ophthalmic laboratory technician, with greater expertise, more educational and supervisory responsibilities, and more independent judgment. In some settings may also participate in or perform clinical photography and a variety of tests.	Joint Commission on Allied Health Personnel in Ophthalmology (JCAHPO); St. Paul, MN (651) 731-2944; www.jcahpo.org; Association of Technical Personnel in Ophthalmology (ATPO); St. Paul, MN (651) 731-7239; www.apto.org	COMT (Certified Ophthalmic Medical Technologist)	Joint Commission on Allied Health Personnel in Ophthalmology (JCAHPO); (651) 731-2944; www.jcahpo.org	high-school diploma or equivalent for technicians and 2 years of undergraduate study for technologists
Orthoptics	Orthoptist	Uses diagnostic tests and precise ophthalmic measurements to correct binocular visual disorders, including lazy eye, strabismus (misaligned eyes), and double vision. Educates patients about binocular visual disorders and their management.	American Orthoptic Council (608) 233-5383; American Association of Certified Orthoptists; www.orthoptics.org			bachelor's degree + 2 year program
Orthotics and Prosthetics	Orthotist/ Prosthetist	Designs, fabricates, maintains, and fits braces, orthoses, prostheses, surgical shoes and supports, and other devices that help patients with amputations, congenital limb anomalies, missing body parts (e.g. limbs), and musculoskeletal injuries achieve optimal use of their limbs.	American Academy of Orthotics and Prosthetics; Alexandria, VA (703) 836-0788; www.oandp.org		American Board for Certification in Orthotics and Prosthetics (ABCOP); (703) 836-7114; www.abcop.org	Certificate, bachelor's or master's degree

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Perfusion	Perfusionist/ clinical perfusion scientist	Manages the circulation of blood from the body through an extracorporeal oxygenation device and back to the body whenever temporary support of circulatory and lung function is needed. Works primarily but not exclusively in open heart surgery.	American Academy of Cardiovascular Perfusion; Allentown, PA (610) 395-4853; www./users.aol.com/OfficeAACP/home.html		American Board of Cardiovascular Perfusion; (601) 582-2227; www.abcp.org	Most programs require college-level science and math
Pharmacy	Pharmacy technician	Works under the supervision of pharmacists to prepare and dispense medications and other prescribed health care products.	American Association of Pharmacy Technicians (AAPT); Greensboro, NC (877) 368-4771; www.pharmacy-technician.com; National Pharmacy Technician Association (NPTA); Houston, TX (281) 866-7900; www.npta.org	CPhT (Certified Pharmacy Technician)	Pharmacy Technician Certification Board (PTCB); (202) 429-7576; www.ptcb.org	high-school diploma

Physical Therapy	Physical therapist (PT)	Helps people to regain or maximize balance, body movement, endurance, and strength, esp. for those individuals who have birth defects or those who have suffered physical injuries, strokes, or the many bone, joint, muscle, traumatic, or neurological illnesses that limit physical functioning.	American Physical Therapy Association (APTA); Alexandria, VA (703) 684-APTA (2782); www.apta.org		State administered national exam; Commission on Accreditation in Physical Therapy Education (CAPTE)	post-bachelor's degree. [The majority of programs offer a master's degree, but a growing number of programs offer the Doctor of Physical Therapy (DPT) degree.]
Physical Therapy	Physical therapist assistant (PTA)	Assists the physical therapist to manage diseases and conditions such as arthritis, back pain, fractures, spinal and sports injuries.	APTA		CAPTE	associate's degree
Physician Assistant	Physician assistant (PA)	Practices medicine under the supervision of a doctor of medicine or osteopathy. Takes medical histories, performs examinations, makes diagnoses, provides treatment, and performs surgical and other procedures as indicated by specialty.	American Academy of Physician Assistants; Alexandria, VA (703) 836-2272; www.aapa.org	PA-C (Physician Assistant- Certified)	Certification exam given by National Commission on Certification of Physician Assistants (NCCPA); (678) 417-8100; www.nccpa.net	Most programs require bachelor's degree or medical experience, e.g., nurse, EMT
Polysomnographic Technology (Polysomnography)	Polysomnographic technologist (Sleep technologist)	Monitors nighttime sleep patterns in a formal sleep test (polysomnogram) and makes audiovisual recordings, as well as noninvasive records of the patient's breathing, oxygenation, EEG, heart rate, and muscle movement.	Association of Polysomnographic Technologists; Westchester, IL (708) 492-0796; www.aptweb.org	RPSGT (Registered Polysomnographic Technologist)	The Board of Registered Polysomnographic Technologists; (703) 610-9020; www.brpt.org	Clinical experience and CPR certification required

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Radiologic Technology	Radiation therapist	Administers targeted doses of radiation to a patient's body to treat cancer and other diseases.	American Society of Radiologic Technologists (ASRT); Albuquerque, NM (505) 298-4500; www.asrt.org	RT(R) (Technologist in Diagnostic Radiology), RT(T) (Radiation Therapy Technologist)	American Registry of Radiologic Technologists (ARRT); (651) 687-0048; www.arrt.org	One, 2, or 4 years, depending on objectives
Radiologic Technology	Radiographer	Uses radiation (x-rays) to produce black-and-white images of body parts. The images are captured on film, computer, or videotape. X-rays may be used, e.g., to detect bone fractures, find foreign objects in the body, identify masses or infections, and demonstrate the relationship between bone and soft tissue.		RT(R)(Technologist in Diagnostic Radiology)		Two-to-four years, depending on objectives
Rehabilitation Counseling	Rehabilitation counselor	Helps individuals to overcome barriers that might otherwise prevent their optimal independent participation in society. See: Community counselor, under Counseling-related Professions, above.	National Rehabilitation Counseling Association; Manassas, VA (703) 361-2077; http://nrca-net.org; American Rehabilitation Counseling Association; Alexandria, VA (703) 823-9800; www.nchrtm.okstate.edu/arca	CRC (Certified Rehabilitation Counselor), CCRC (Canadian Certified Rehabilitation Counselor)	Commission on Rehabilitation Counselor Certification (CRCC); (847) 394-2104; www.crccertification.com	master's degree

Respiratory Therapy (Respiratory Care)	Respiratory therapist (advanced)	Participates in the management of heart and lung disorders, including illnesses such as acute lung injury, chronic obstructive lung disease, cystic fibrosis, pulmonary fibrosis, reactive airways disease, and respiratory arrest or distress. Performs blood gas analysis, and tracheal intubation. Participates in advanced life support, cardiac care units, and critical care units (e.g. in managing mechanical ventilation).	American Association for Respiratory Care (AARC); Irving, TX (972) 243-2272; www.aarc.org	RRT (Registered Respiratory Therapist); RPFT (Registered Pulmonary Function Technologist)	National Board for Respiratory Care (NBRC); (913) 599-4200; www.nbrc.org, Committee on Accreditation for Respiratory Care (CoARC); (817) 283-2835 www.coarc.com	associate's degree
Respiratory Therapy (Respiratory Care)	Respiratory therapist (entry level)	Administers general respiratory care, assuming clinical responsibility for specific modalities.	AARC	CRT (Certified Respiratory Therapist)	NBRC	associate's degree
Surgical Technology	Surgical technologist (ST)	Prepares the operating room and surgical patient for the anticipated surgery. Tests operating room equipment. Intraoperatively maintains operative sterility; supplies the surgeon with needed instruments and equipment, and assists the anesthesiologists, nursing staff, or surgeons in their roles in the surgical theatre.	Association of Surgical Technologists; Centennial, CO (303) 694-9130; www.ast.org	CST (Certified Surgical Technologist)	Liaison Council on Certification for the Surgical Technologist (LCC-ST); (719) 328-0800; www.lcc-st.org	Nine- to 24-month program, leading to certification

Health Professions (Continued)

Health Professions	*Job Title*	*Brief Description*	*Professional Organization*	*Certificate (Credential)*	*Certifying Organization*	*Education*
Therapeutic Recreation	Therapeutic recreation specialist/ recre-ational therapist	Uses leisure activities, such as the arts, games, music, or sports, to help individuals with functional limitations to build or rebuild confidence, and play fuller roles in their communities, families, and so-ciety at large. Often works as a member of an interdiscipli-nary team that includes phys-iatrists, nurses, therapists, and counselors.	National Therapeutic Recreation Society; Ashburn, VA (703) 858-2153, www.nrpa.org; American Thera-peutic Recreation Association; Alex-andria, VA (703) 683-9420; www.atra-tr.org.	CTRS (Certified Therapeutic Recre-ation Specialist)	National Council for Therapeutic Recre-ation Certification (NCTRC); (845) 639-1439; www.nctrc.org	bachelor's degree

Note: For "Low vision specialist," see under "Blindness and Visual Impairment Professions." For "Medical laboratory technician" and "Medical technologist," see under "Clinical Laboratory Science." For "Prosthetist," see under "Orthotics and Prosthetics." For "Speech-language pathologist," see under "Audiology and Speech-Language Pathology."

APPENDIX 15

Professional Designations and Titles in the Health Sciences

AARCF	American Association for Respiratory Care Fellow
ACCE	ASPO (American Society for Psychoprophylaxis in Obstetrics) Certified Childbirth Educator
ANP	Adult Nurse Practitioner
AOCN	American Oncology Certified Nurse
ARNP	Advanced Registered Nurse Practitioner
ARRT	American Registry of Radiologic Technologists
ART	Accredited Record Technologist
ATC	Athletic Trainer, Certified
BC	Bachelor of Surgery
BCh	Bachelor of Surgery
BM	Bachelor of Medicine
BS	Bachelor of Science; Bachelor of Surgery
BSN	Bachelor of Science in Nursing
CAPA	Certified Ambulatory Post-Anesthesia Nurse
CARN	Certified Addiction Registered Nurse
CB	Bachelor of Surgery
CCCN	Certified Continence Care Nurse
CCM	Certified Case Manager
CCP	Certified Clinical Perfusionist
CCRN	Certified Critical Care Registered Nurse
CD	Clinical Dietitian
CDA	Certified Dental Assistant
CDE	Certified Diabetes Educator
CEN	Certified Emergency Nurse
CETN	Certified Enterostomal Therapy Nurse
CFNP	Certified Family Nurse Practitioner
CFRN	Certified Flight Registered Nurse
CGN	Certified Gastroenterology Nurse
CGRN	Certified Gastroenterology Registered Nurse
CGT	Certified Gastroenterology Technician
ChB	Bachelor of Surgery
ChD	Doctor of Surgery
CHN	Certified Hemodialysis Nurse
CHUC	Certified Health Unit Coordinator
CIC	Certified Infection Control Nurse
CLA	Certified Laboratory Assistant
CLPNI	Certified Licensed Practitioner Nursing, Intravenous
CLS	Clinical Laboratory Specialist
CLT	Certified Laboratory Technician; Clinical Laboratory Technician
CMA-A	Certified Medical Assistant, Administrative
CMA-C	Certified Medical Assistant, Clinical
CNA	Certified Nursing Assistant; Certified in Nursing Administration
CNAA	Certified in Nursing Administration, Advanced
CNDLTC	Certified Nursing Director of Long-Term Care
CNM	Certified Nurse Midwife
CNMT	Certified Nuclear Medical Technologist
CNN	Certified Nephrology Nurse
CNOR	Certified Nurse, Operating Room
CNP	Community Nurse Practitioner
CNRN	Certified Neuroscience Registered Nurse
CNS	Clinical Nurse Specialist
CNSN	Certified Nutrition Support Nurse
COCN	Certified Ostomy Care Nurse
COHN	Certified Occupational Health Nurse
COHN-S	Certified Occupational Health Nurse—Specialty
CORLN	Certified Otorhinolaryngology Nurse
CORN	Certified Operating Room Nurse
COTA	Certified Occupational Therapy Assistant
CPAN	Certified Post-Anesthesia Nurse
CPDN	Certified Peritoneal Dialysis Nurse
CPN	Certified Pediatric Nurse
CPNP	Certified Pediatric Nurse Practitioner
CPON	Certified Pediatric Oncology Nurse
CPSN	Certified Plastic Surgical Nurse
CRNA	Certified Registered Nurse Anesthetist
CRNFA	Certified Registered Nurse, First Assistant
CRNH	Certified Registered Hospice Nurse

CRNI	Certified Registered Nurse Infusion
CRNO	Certified Registered Nurse, Ophthalmology
CRRN	Certified Rehabilitation Registered Nurse
CRTT	Certified Respiratory Therapy Technician
CSN	Certified School Nurse
CST	Certified Surgical Technologist
CURN	Certified Urology Registered Nurse
CWCN	Certified Wound Care Nurse
DC	Doctor of Chiropractic
DCh	Doctor of Surgery
DDS	Doctor of Dental Surgery
DM	Doctor of Medicine
DMD	Doctor of Dental Medicine
DME	Doctor of Medical Education
DMSc	Doctor of Medical Science
DMV	Doctor of Veterinary Medicine
DN	Doctor of Nursing
DNE	Doctor of Nursing Education
DNS	Doctor of Nursing Science
DNSc	Doctor of Nursing Science
DO	Doctor of Osteopathy
DP	Doctor of Pharmacy
DPH	Doctor of Public Health
DPhil	Doctor of Philosophy
DPHN	Doctor of Public Health Nursing
DPM	Doctor of Podiatric Medicine
DrPH	Doctor of Public Health
DS	Doctor of Science
DSc	Doctor of Science
DSW	Doctor of Social Work
DVM	Doctor of Veterinary Medicine
DVMS	Doctor of Veterinary Medicine and Surgery
EdD	Doctor of Education
EMT-B	Emergency Medical Technician—Basic
EMT-D	Emergency Medical Technician—Defibrillation
EMT-I	Emergency Medical Technician—Intermediate
EMT-P	Emergency Medical Technician—Paramedic
FAAAI	Fellow of the American Academy of Allergy and Immunology
FAAFP	Fellow of the American Academy of Family Physicians
FAAN	Fellow of the American Academy of Neurology
FAAN	Fellow of the American Academy of Nursing
FAAO	Fellow of the American Academy of Ophthalmology
FAAO	Fellow of the American Academy of Osteopathy
FAAOS	Fellow of the American Academy of Orthopedic Surgeons
FAAP	Fellow of the American Academy of Pediatrics
FACC	Fellow of the American College of Cardiology
FACCP	Fellow of the American College of Chest Physicians
FACD	Fellow of the American College of Dentists
FACE	Fellow of the American College of Endocrinology
FACEP	Fellow of the American College of Emergency Physicians
FACOG	Fellow of the American College of Obstetrics and Gynecology
FACP	Fellow of the American College of Physicians
FACS	Fellow of the American College of Surgeons
FACSM	Fellow of the American College of Sports Medicine
FAOTA	Fellow of the American Occupational Therapy Association
FAPHA	Fellow of the American Public Health Association
FCCM	Fellow of Critical Care Medicine
FCPS	Fellow of the College of Physicians and Surgeons
FFA	Fellow of the Faculty of Anaesthetists
FFARCS	Fellow of the Faculty of Anaesthetists of the Royal College of Surgeons
FICC	Fellow of the International College of Chiropractors
FNAAOM	Fellow of the National Academy of Acupuncture and Oriental Medicine
FNP	Family Nurse Practitioner
FP	Family Practitioner
FRCGP	Fellow of the Royal College of General Practitioners
FRCOG	Fellow of the Royal College of Obstetricians and Gynaecologists
FRCP	Fellow of the Royal College of Physicians
FRCPC	Fellow of the Royal College of Physicians of Canada
FRCR	Fellow of the Royal College of Radiologists
FRCS	Fellow of the Royal College of Surgeons
FRCSC	Fellow of the Royal College of Surgeons of Canada
FRCVS	Fellow of the Royal College of Veterinary Surgeons
FRS	Fellow of the Royal Society
GNP	Gerontological Nurse Practitioner

GPN	General Pediatric Nurse
HT	Histologic Technician/ Histologic Technologist
LAC	Licensed Acupuncturist
LAT	Licensed Athletic Trainer
LATC	Licensed Athletic Trainer, Certified
LNC	Legal Nurse Consultant
LPN	Licensed Practical Nurse
LVN	Licensed Visiting Nurse; Licensed Vocational Nurse
MB	Bachelor of Medicine
MBBS	Bachelor of Medicine; Bachelor of Surgery
MCh	Master of Surgery
MD	Doctor of Medicine
ME	Medical Examiner
MEd	Master of Education
MPH	Master of Public Health
MPharm	Master in Pharmacy
MRCP	Member of the Royal College of Physicians
MRCS	Member of the Royal College of Surgeons
MRL	Medical Records Librarian
MS	Master of Science; Master of Surgery
MSc	Master of Surgery
MSN	Master of Science in Nursing
MSurg	Master of Surgery
MSW	Master of Social Work
MT	Medical Technologist
MTA	Medical Technologist Assistant
MT-(ASCP)	Medical Technologist (American Society of Clinical Pathologists)
ND	Doctor of Naturopathy
NMT	Nurse Massage Therapist; Nursing Massage Therapist
NP	Nurse Practitioner
NREMT-P	Nationally Registered Paramedic
OCN	Oncology Certified Nurse
OD	Doctor of Optometry
ONC	Orthopedic Nurse Certified
OT	Occupational Therapist
OTA	Occupational Therapist Assistant
OTC	Orthopedic Technician, Certified
OT-C	Occupational Therapist (Canada)
OTL	Occupational Therapist, Licensed
OTR	Registered Occupational Therapist
PA	Physician Assistant
PA-C	Physician's Assistant Certified
PD	Doctor of Pharmacy
PharmD	Doctor of Pharmacy
PharmG	Graduate in Pharmacy
PhD	Doctor of Philosophy
PNP	Pediatric Nurse Practitioner
PT	Physical Therapist
PTA	Physical Therapist Assistant
RD	Registered Dietitian
RDA	Registered Dental Assistant
RDCS	Registered Diagnostic Cardiac Sonographer
RDH	Registered Dental Hygienist
RDMS	Registered Diagnostic Medical Sonographer
R EEG T	Radiologic Electro-encephalography Technologist
REPT	Registered Evoked Potentials Technologist
RMA	Registered Medical Assistant
RN	Registered Nurse
RNA	Registered Nurse Anesthetist
RNC	Registered Nurse Certified (OB/GYN and Neonatal)
RPh	Registered Pharmacist
RPT	Registered Physical Therapist
RRA	Registered Record Administrator
RRT	Registered Respiratory Therapist
RT	Radiologic Technologist
RT(BD)	Radiologic Technologist Bone Densitometry
RT(CI)	Radiologic Technologist (Cardiac Interventional Therapy)
RT(CT)	Radiologic Technologist (Computed Tomography)
RT(CV)	Radiologic Technologist (Cadiovascular-Interventional Technology)
RT(M)	Radiologic Technologist (Mammography)
RT(MR)	Radiologic Technologist (Magnetic Resonance Imaging)
RT(N)	Nuclear Medicine Technologist
RT(R)	Registered Technologist, Radiographer
RTR	Registered Recreational Therapist
RT(S)	Registered Technologist (Sonography)
RT(T)	Radiation Therapy Technologist
RT(VI)	Radiologic Technologist (Vascular Interventional Therapy)
RVT	Registered Vascular Technologist
ScD	Doctor of Science
SCT	Specialist in Cytotechnology
SM	Master of Surgery
ST	Surgical Technician
VMD	Veterinary Medical Doctor

APPENDIX 16
Documentation System Definitions

ALERT. A charting system used primarily in long-term care in which the patient's chart is tagged to indicate that special charting procedures/precautions need to be initiated and followed for a specified time.

CBE. Acronym for *C*harting *B*y *E*xception, a system for documentation that eliminates the need to chart repetitious findings and tasks. The health care provider uses specially designed admission history and flow sheets that highlight important findings and trends. Only significant findings or exceptions to established standards of care and protocols are documented in the progress notes.

CLINICAL PROGRESSION. A critical path that has been enhanced by the addition of (1) nursing diagnosis, (2) intermediate and discharge goals, and (3) variance tracking. This type of plan is usually used for longer hospital stays not requiring critical care.

CORE. A documentation system designed to support the nursing process. Key elements include database, care plans, flow sheets, progress notes, and discharge summaries. Progress notes use a three-column format and are organized using patient database; action of the health care provider; and evaluation of patient outcome.

CRITICAL PATH. A cause-and-effect grid that outlines usual interventions by health care providers against a timeline for a case type (diagnosis-related group) or otherwise defined homogeneous patient population. This type of plan is usually used in cases requiring critical care.

DAR. Acronym for the organizing structure for writing progress notes using Focus Charting©. Each Focus entry includes *D*atabase describing the current patient condition; *A*ction taken by the health care provider; and patient *R*esponse or outcome to the intervention.

FACT. Acronym for a documentation system including these key elements: *F*lowsheets for specific patient populations; standardized *A*ssessment parameters printed on the chart form; *C*oncise integrated progress notes; and *T*imely entries by health care providers at the time that care is given.

FOCUS CHARTING©. Trademark title for a three-column format for organizing the progress notes in the patient record. The FOCUS column serves as an index. The body of the note is organized by identifying the DATAbase describing the current patient condition; ACTION taken by the health care provider; and patient RESPONSE to or outcome of the intervention.

PIE. Acronym for a process-oriented documentation system. The progress notes in the patient record use (P) to define the particular *P*roblem; (I) to document *I*ntervention; and (E) to *E*valuate the patient outcome. PIE charting integrates care planning with progress notes.

POMR. Acronym for *P*roblem-*O*riented *M*edical *R*ecord, a method of establishing and maintaining the patient's medical record so that problems are clearly stated. These data are kept in the front of the chart and are evaluated as frequently as indicated with respect to recording changes in the patient's problems as well as progress made in solving the problems. Use of this system may bring a degree of comprehensiveness to total patient care that might not be possible with conventional medical records. Internists, family practitioners, and pediatricians use the POMR system.

SOMR. Source-Oriented Medical Record; groups formation according to its source: laboratory work, x-rays, examinations, consultations.

SOAP. Acronym for an organized structure for keeping progress notes in the chart. Each entry contains the date, number, and title of the patient's particular problem, followed by the SOAP headings: *S*ubjective findings; *O*bjective findings; *A*ssessment, the documented analysis and conclusions concerning the findings; and *P*lan for further diagnostic or therapeutic action. If the patient has multiple problems, a SOAP entry on the chart is made for each problem.

SOAPIER. Adds to the SOAP headings listed above: documentation of *I*ntervention implemented to solve the identified problem; *E*valuation of the effectiveness of the intervention; and care plan *R*evisions indicated.

VARIANCE. A task or outcome that does not occur as described or within the time frame identified on a critical path or clinical progression.

APPENDIX 17
Standard and Universal Precautions

Appendix 17–1 Recommendations for Isolation Precautions in Hospitals

RATIONALE FOR ISOLATION PRECAUTIONS IN HOSPITALS

Transmission of infection within a hospital requires three elements: a source of infecting microorganisms, a susceptible host, and a means of transmission for the microorganism.

Source

Human sources of the infecting microorganisms in hospitals may be patients, personnel, or, on occasion, visitors, and may include persons with acute disease, persons in the incubation period of a disease, persons who are colonized by an infectious agent but have no apparent disease, or persons who are chronic carriers of an infectious agent. Other sources of infecting microorganisms can be the patient's own endogenous flora, which may be difficult to control, and inanimate environmental objects that have become contaminated, including equipment and medications.

Host

Resistance among persons to pathogenic microorganisms varies greatly. Some persons may be immune to infection or may be able to resist colonization by an infectious agent; others exposed to the same agent may establish a commensal relationship with the infecting microorganism and become asymptomatic carriers; still others may develop clinical disease. Host factors such as age; underlying diseases; certain treatments with antimicrobials, corticosteroids, or other immunosuppressive agents; irradiation; and breaks in the first line of defense mechanisms caused by such factors as surgical operations, anesthesia, and indwelling catheters may render patients more susceptible to infection.

Transmission

Microorganisms are transmitted in hospitals by several routes, and the same microorganism may be transmitted by more than one route. There are five main routes of transmission: contact, droplet, airborne, common vehicle, and vectorborne. For the purpose of this guideline, common vehicle and vectorborne transmission will be discussed only briefly, because neither plays a significant role in typical nosocomial infections.

1. *Contact transmission,* the most important and frequent mode of transmission of nosocomial infections, is divided into two subgroups: direct-contact transmission and indirect-contact transmission.
2. Direct-contact transmission involves a direct body surface-to-body surface contact and physical transfer of microorganisms between a susceptible host and an infected or colonized person, such as occurs when a person turns a patient, gives a patient a bath, or performs other patient-care activities that require direct personal contact. Direct-contact transmission also can occur between two patients, with one serving as the source of the infectious microorganisms and the other as a susceptible host.
3. Indirect-contact transmission involves contact of a susceptible host with a contaminated intermediate object, usually inanimate, such as contaminated instruments, needles, or dressings, or contaminated hands that are not washed and gloves that are not changed between patients.
4. *Droplet transmission,* theoretically, is a form of contact transmission. However, the mechanism of transfer of the pathogen to the host is quite distinct from either direct- or indirect-contact transmission. Therefore, droplet transmission will be considered a separate route of transmission in this guideline. Droplets are generated from the source person primarily during coughing, sneezing, and talking, and during the performance of certain procedures such as suctioning and bronchoscopy. Transmission occurs when droplets containing microorganisms generated from the infected person are propelled a short distance through the air and deposited on the host's conjunctivae, nasal mucosa, or mouth. Because droplets do not remain suspended in the air, special air handling and ventilation are not required to prevent droplet transmission; that is, droplet transmission *must not* be confused with airborne transmission.
5. *Airborne transmission* occurs by dissemination of either airborne droplet nuclei (small-particle residue [5 μm or smaller in size] of evaporated droplets containing

microorganisms that remain suspended in the air for long periods of time) or dust particles containing the infectious agent. Microorganisms carried in this manner can be dispersed widely by air currents and may become inhaled by a susceptible host within the same room or over a longer distance from the source patient, depending on environmental factors; therefore, special air handling and ventilation are required to prevent airborne transmission. Microorganisms transmitted by airborne transmission include *Mycobacterium tuberculosis* and the rubeola and varicella viruses.

6. *Common vehicle transmission* applies to microorganisms transmitted by contaminated items such as food, water, medications, devices, and equipment.
7. *Vectorborne transmission* occurs when vectors such as mosquitoes, flies, rats, and other vermin transmit microorganisms; this route of transmission is of less significance in hospitals in the United States than in other regions of the world.

Isolation precautions are designed to prevent transmission of microorganisms by these routes in hospitals. Because agent and host factors are more difficult to control, interruption of transfer of microorganisms is directed primarily at transmission. The recommendations presented in this guideline are based on this concept.

Placing a patient on isolation precautions, however, often presents certain disadvantages to the hospital, patients, personnel, and visitors. Isolation precautions may require specialized equipment and environmental modifications that add to the cost of hospitalization. Isolation precautions may make frequent visits by nurses, physicians, and other personnel inconvenient, and they may make it more difficult for personnel to give the prompt and frequent care that sometimes is required. The use of a multi-patient room for one patient uses valuable space that otherwise might accommodate several patients. Moreover, forced solitude deprives the patient of normal social relationships and may be psychologically harmful, especially to children. These disadvantages, however, must be weighed against the hospital's mission to prevent the spread of serious and epidemiologically important microorganisms in the hospital.

FUNDAMENTALS OF ISOLATION PRECAUTIONS

A variety of infection control measures are used for decreasing the risk of transmission of microorganisms in hospitals. These measures make up the fundamentals of isolation precautions.

Handwashing and Gloving

Handwashing frequently is called the single most important measure to reduce the risks of transmitting organisms from one person to another or from one site to another on the same patient. The scientific rationale, indications, methods, and products for handwashing are delineated in other publications.

Washing hands as promptly and thoroughly as possible between patient contacts and after contact with blood, body fluids, secretions, excretions, and equipment or articles contaminated by them is an important component of infection control and isolation precautions. In addition to handwashing, gloves play an important role in reducing the risks of transmission of microorganisms.

Gloves are worn for three important reasons in hospitals. First, gloves are worn to provide a protective barrier and to prevent gross contamination of the hands when touching blood, body fluids, secretions, excretions, mucous membranes, and nonintact skin; the wearing of gloves in specified circumstances to reduce the risk of exposures to bloodborne pathogens is mandated by the OSHA bloodborne pathogens final rule. Second, gloves are worn to reduce the likelihood that microorganisms present on the hands of personnel will be transmitted to patients during invasive or other patient-care procedures that involve touching a patient's mucous membranes and nonintact skin. Third, gloves are worn to reduce the likelihood that hands of personnel contaminated with microorganisms from a patient or a fomite can transmit these microorganisms to another patient. In this situation, gloves must be changed between patient contacts and hands must be washed after gloves are removed.

Wearing gloves does not replace the need for handwashing, because gloves may have small, inapparent defects or may be torn during use, and hands can become contaminated during removal of gloves. Failure to change gloves between patient contacts is an infection control hazard.

Patient Placement

Appropriate patient placement is a significant component of isolation precautions. A private room is important to prevent direct- or indirect-contact transmission when the source patient has poor hygienic habits, contaminates the environment, or cannot be expected to assist in maintaining infection control precautions to limit transmission of microorganisms (e.g., infants, children, and patients with altered mental status). When possible, a patient with highly transmissible or epidemiologically important

microorganisms is placed in a private room with handwashing and toilet facilities, to reduce opportunities for transmission of microorganisms.

When a private room is not available, an infected patient is placed with an appropriate roommate. Patients infected by the same microorganism usually can share a room, provided they are not infected with other potentially transmissible microorganisms, and the likelihood of reinfection with the same organism is minimal. Such sharing of rooms, also referred to as cohorting patients, is useful especially during outbreaks or when there is a shortage of private rooms. When a private room is not available and cohorting is not achievable or recommended, it is very important to consider the epidemiology and mode of transmission of the infecting pathogen and the patient population being served in determining patient placement. Under these circumstances, consultation with infection control professionals is advised before patient placement. Moreover, when an infected patient shares a room with a noninfected patient, it also is important that patients, personnel, and visitors take precautions to prevent the spread of infection and that roommates are selected carefully.

Guidelines for construction, equipment, air handling, and ventilation for isolation rooms are delineated in other publications. A private room with appropriate air handling and ventilation is particularly important for reducing the risk of transmission of microorganisms from a source patient to susceptible patients and other persons in hospitals when the microorganism is spread by airborne transmission. Some hospitals use an isolation room with an anteroom as an extra measure of precaution to prevent airborne transmission. Adequate data regarding the need for an anteroom, however, is not available. Ventilation recommendations for isolation rooms housing patients with pulmonary tuberculosis have been delineated in other CDC guidelines.

Transport of Infected Patients

Limiting the movement and transport of patients infected with virulent or epidemiologically important microorganisms and ensuring that such patients leave their rooms only for essential purposes reduce opportunities for transmission of microorganisms in hospitals. When patient transport is necessary, it is important that 1) appropriate barriers (e.g., masks, impervious dressings) are worn or used by the patient to reduce the opportunity for transmission of pertinent microorganisms to other patients, personnel, and visitors and to reduce contamination of the environment; 2) personnel in the area to which the patient is to be taken are notified of the impending arrival of the patient and of the precautions to be used to reduce the risk of transmission of infectious microorganisms; and 3) patients are informed of ways by which they can assist in preventing the transmission of their infectious microorganisms to others.

Masks, Respiratory Protection, Eye Protection, Face Shields

Various types of masks, goggles, and face shields are worn alone or in combination to provide barrier protection. A mask that covers both the nose and the mouth, and goggles or a face shield are worn by hospital personnel during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, or excretions to provide protection of the mucous membranes of the eyes, nose, and mouth from contact transmission of pathogens. The wearing of masks, eye protection, and face shields in specified circumstances to reduce the risk of exposures to bloodborne pathogens is mandated by the OSHA bloodborne pathogens final rule. A surgical mask generally is worn by hospital personnel to provide protection against spread of infectious large-particle droplets that are transmitted by close contact and generally travel only short distances (up to 3 ft) from infected patients who are coughing or sneezing.

An area of major concern and controversy over the last several years has been the role and selection of respiratory protection equipment and the implications of a respiratory protection program for prevention of transmission of tuberculosis in hospitals. Traditionally, although the efficacy was not proven, a surgical mask was worn for isolation precautions in hospitals when patients were known or suspected to be infected with pathogens spread by the airborne route of transmission. In 1990, however, the CDC tuberculosis guidelines stated that surgical masks may not be effective in preventing the inhalation of droplet nuclei and recommended the use of disposable particulate respirators, despite the fact that the efficacy of particulate respirators in protecting persons from the inhalation of *M. tuberculosis* had not been demonstrated. By definition, particulate respirators included dust-mist (DM), dust-fume-mist (DFM), or high-efficiency particulate air (HEPA) filter respirators certified by the CDC National Institute for Occupational Safety and Health (NIOSH); because the generic term "particulate respirator" was used in the 1990 guidelines, the implication was that any of these respirators provided sufficient protection.

In 1993, a draft revision of the CDC tuberculosis guidelines outlined performance criteria for respirators and stated that some DM or DFM respirators might not meet these criteria. After review of public comments, the guidelines were finalized in October

1994, with the draft respirator criteria unchanged. At that time, the only class of respirators that were known to consistently meet or exceed the performance criteria outlined in the 1994 tuberculosis guidelines and that were certified by NIOSH (as required by OSHA) were HEPA filter respirators. Subsequently, NIOSH revised the testing and certification requirements for all types of air-purifying respirators, including those used for tuberculosis control. The new rule, effective in July 1995, provides a broader range of certified respirators that meet the performance criteria recommended by CDC in the 1994 tuberculosis guidelines. NIOSH has indicated that the N95 (N category at 95% efficiency) meets the CDC performance criteria for a tuberculosis respirator. The new respirators are likely to be available in late 1995. Additional information on the evolution of respirator recommendations, regulations to protect hospital personnel, and the role of various federal agencies in respiratory protection for hospital personnel has been published.

Gowns and Protective Apparel

Various types of gowns and protective apparel are worn to provide barrier protection and to reduce opportunities for transmission of microorganisms in hospitals. Gowns are worn to prevent contamination of clothing and to protect the skin of personnel from blood and body fluid exposures. Gowns especially treated to make them impermeable to liquids, leg coverings, boots, or shoe covers provide greater protection to the skin when splashes or large quantities of infective material are present or anticipated. The wearing of gowns and protective apparel under specified circumstances to reduce the risk of exposures to bloodborne pathogens is mandated by the OSHA bloodborne pathogens final rule.

Gowns are also worn by personnel during the care of patients infected with epidemiologically important microorganisms to reduce the opportunity for transmission of pathogens from patients or items in their environment to other patients or environments; when gowns are worn for this purpose, they are removed before leaving the patient's environment and hands are washed. Adequate data regarding the efficacy of gowns for this purpose, however, are not available.

Patient-Care Equipment and Articles

Many factors determine whether special handling and disposal of used patient-care equipment and articles are prudent or required, including the likelihood of contamination with infective material; the ability to cut, stick, or otherwise cause injury (needles, scalpels, and other sharp instruments [sharps]); the severity of the associated disease; and the environmental stability of the pathogens involved. Some used articles are enclosed in containers or bags to prevent inadvertent exposures to patients, personnel, and visitors and to prevent contamination of the environment. Used sharps are placed in puncture-resistant containers; other articles are placed in a bag. One bag is adequate if the bag is sturdy and the article can be placed in the bag without contaminating the outside of the bag; otherwise, two bags are used.

The scientific rationale, indications, methods, products, and equipment for reprocessing patient-care equipment are delineated in other publications. Contaminated, reusable critical medical devices or patient-care equipment (i.e., equipment that enters normally sterile tissue or through which blood flows) or semicritical medical devices or patient-care equipment (i.e., equipment that touches mucous membranes) are sterilized or disinfected (reprocessed) after use to reduce the risk of transmission of microorganisms to other patients; the type of reprocessing is determined by the article and its intended use, the manufacturer's recommendations, hospital policy, and any applicable guidelines and regulations.

Noncritical equipment (i.e., equipment that touches intact skin) contaminated with blood, body fluids, secretions, or excretions is cleaned and disinfected after use, according to hospital policy. Contaminated disposable (single-use) patient-care equipment is handled and transported in a manner that reduces the risk of transmission of microorganisms and decreases environmental contamination in the hospital; the equipment is disposed of according to hospital policy and applicable regulations.

Linen and Laundry

Although soiled linen may be contaminated with pathogenic microorganisms, the risk of disease transmission is negligible if it is handled, transported, and laundered in a manner that avoids transfer of microorganisms to patients, personnel, and environments. Rather than rigid rules and regulations, hygienic and common sense storage and processing of clean and soiled linen are recommended. The methods for handling, transporting, and laundering of soiled linen are determined by hospital policy and any applicable regulations.

Dishes, Glasses, Cups, and Eating Utensils

No special precautions are needed for dishes, glasses, cups, or eating utensils. Either disposable or reusable dishes and utensils can be used for patients on isolation

precautions. The combination of hot water and detergents used in hospital dishwashers is sufficient to decontaminate dishes, glasses, cups, and eating utensils.

Routine and Terminal Cleaning

The room, or cubicle, and bedside equipment of patients on Transmission-Based Precautions are cleaned using the same procedures used for patients on Standard Precautions, unless the infecting microorganism(s) and the amount of environmental contamination indicates special cleaning. In addition to thorough cleaning, adequate disinfection of bedside equipment and environmental surfaces (e.g., bedrails, bedside tables, carts, commodes, doorknobs, faucet handles) is indicated for certain pathogens, especially enterococci, which can survive in the inanimate environment for prolonged periods of time. Patients admitted to hospital rooms that previously were occupied by patients infected or colonized with such pathogens are at increased risk of infection from contaminated environmental surfaces and bedside equipment if they have not been cleaned and disinfected adequately. The methods, thoroughness, and frequency of cleaning and the products used are determined by hospital policy.

HICPAC ISOLATION PRECAUTIONS

There are two tiers of HICPAC isolation precautions. In the first, and most important, tier are those precautions designed for the care of all patients in hospitals, regardless of their diagnosis or presumed infection status. Implementation of these "Standard Precautions" is the primary strategy for successful nosocomial infection control. In the second tier are precautions designed only for the care of specified patients. These additional "Transmission-Based Precautions" are for patients known or suspected to be infected by epidemiologically important pathogens spread by airborne or droplet transmission or by contact with dry skin or contaminated surfaces.

Standard Precautions

Standard Precautions synthesize the major features of UP (Blood and Body Fluid Precautions) (designed to reduce the risk of transmission of bloodborne pathogens) and BSI (designed to reduce the risk of transmission of pathogens from moist body substances) and applies them to all patients receiving care in hospitals, regardless of their diagnosis or presumed infection status. Standard Precautions apply to 1) blood; 2) all body fluids, secretions, and excretions except sweat, regardless of whether or not they contain visible blood; 3) nonintact skin; and 4) mucous membranes. Standard Precautions are designed to reduce the risk of transmission of microorganisms from both recognized and unrecognized sources of infection in hospitals.

Transmission-Based Precautions

Transmission-Based Precautions are designed for patients documented or suspected to be infected with highly transmissible or epidemiologically important pathogens for which additional precautions beyond Standard Precautions are needed to interrupt transmission in hospitals. There are three types of Transmission-Based Precautions: Airborne Precautions, Droplet Precautions, and Contact Precautions. They may be combined for diseases that have multiple routes of transmission. When used either singularly or in combination, they are to be used in addition to Standard Precautions.

Airborne Precautions are designed to reduce the risk of airborne transmission of infectious agents. Airborne transmission occurs by dissemination of either airborne droplet nuclei (small-particle residue [5 μm or smaller in size] of evaporated droplets that may remain suspended in the air for long periods of time) or dust particles containing the infectious agent. Microorganisms carried in this manner can be dispersed widely by air currents and may become inhaled by or deposited on a susceptible host within the same room or over a longer distance from the source patient, depending on environmental factors; therefore, special air handling and ventilation are required to prevent airborne transmission. Airborne Precautions apply to patients known or suspected to be infected with epidemiologically important pathogens that can be transmitted by the airborne route.

Droplet Precautions are designed to reduce the risk of droplet transmission of infectious agents. Droplet transmission involves contact of the conjunctivae or the mucous membranes of the nose or mouth of a susceptible person with large-particle droplets (larger than 5 μm in size) containing microorganisms generated from a person who has a clinical disease or who is a carrier of the microorganism. Droplets are generated from the source person primarily during coughing, sneezing, or talking and during the performance of certain procedures such as suctioning and bronchoscopy. Transmission via large-particle droplets requires close contact between source and

recipient persons, because droplets do not remain suspended in the air and generally travel only short distances, usually 3 ft or less, through the air. Because droplets do not remain suspended in the air, special air handling and ventilation are not required to prevent droplet transmission. Droplet Precautions apply to any patient known or suspected to be infected with epidemiologically important pathogens that can be transmitted by infectious droplets.

Contact Precautions are designed to reduce the risk of transmission of epidemiologically important microorganisms by direct or indirect contact. Direct-contact transmission involves skin-to-skin contact and physical transfer of microorganisms to a susceptible host from an infected or colonized person, such as occurs when personnel turn patients, bathe patients, or perform other patient-care activities that require physical contact. Direct-contact transmission also can occur between two patients (e.g., by hand contact), with one serving as the source of infectious microorganisms and the other as a susceptible host. Indirect-contact transmission involves contact of a susceptible host with a contaminated intermediate object, usually inanimate, in the patient's environment. Contact Precautions apply to specified patients known or suspected to be infected or colonized (presence of microorganism in or on patient but without clinical signs and symptoms of infection) with epidemiologically important microorganisms than can be transmitted by direct or indirect contact.

EMPIRIC USE OF AIRBORNE, DROPLET, OR CONTACT PRECAUTIONS

In many instances, the risk of nosocomial transmission of infection may be highest before a definitive diagnosis can be made and before precautions based on that diagnosis can be implemented. The routine use of Standard Precautions for all patients should reduce greatly this risk for conditions other than those requiring Airborne, Droplet, or Contact Precautions. While it is not possible to prospectively identify all patients needing these enhanced precautions, certain clinical syndromes and conditions carry a sufficiently high risk to warrant the empiric addition of enhanced precautions while a more definitive diagnosis is pursued.

The organisms listed under the column "Potential Pathogens" are not intended to represent the complete or even most likely diagnoses, but rather possible etiologic agents that require additional precautions beyond Standard Precautions until they can be ruled out. Infection control professionals are encouraged to modify or adapt this table according to local conditions. To ensure that appropriate empiric precautions are implemented always, hospitals must have systems in place to evaluate patients routinely, according to these criteria as part of their preadmission and admission care.

IMMUNOCOMPROMISED PATIENTS

Immunocompromised patients vary in their susceptibility to nosocomial infections, depending on the severity and duration of immunosuppression. They generally are at increased risk for bacterial, fungal, parasitic, and viral infections from both endogenous and exogenous sources. The use of Standard Precautions for all patients and Transmission-Based Precautions for specified patients, as recommended in this guideline, should reduce the acquisition by these patients of institutionally acquired bacteria from other patients and environments.

It is beyond the scope of this guideline to address the various measures that may be used for immunocompromised patients to delay or prevent acquisition of potential pathogens during temporary periods of neutropenia. Rather, the primary objective of this guideline is to prevent transmission of pathogens from infected or colonized patients in hospitals. Users of this guideline, however, are referred to the "Guideline for Prevention of Nosocomial Pneumonia" (95,96) for the HICPAC recommendations for prevention of nosocomial aspergillosis and Legionnaires' disease in immunocompromised patients.

RECOMMENDATIONS

The recommendations presented below are categorized as follows:

Category IA. Strongly recommended for all hospitals and strongly supported by well-designed experimental or epidemiologic studies.

Category IB. Strongly recommended for all hospitals and reviewed as effective by experts in the field and a consensus of HICPAC based on strong rationale and suggestive evidence, even though definitive scientific studies have not been done.

Category II. Suggested for implementation in many hospitals. Recommendations may be supported by suggestive clinical or epidemiologic studies, a strong theoretical rationale, or definitive studies applicable to some, but not all, hospitals.

No recommendation; unresolved issue. Practices for which insufficient evidence or consensus regarding efficacy exists.

The recommendations are limited to the topic of isolation precautions. Therefore, they must be supplemented by hospital policies and procedures for other aspects of infection and environmental control, occupational health, administrative and legal issues, and other issues beyond the scope of this guideline.

I. Administrative Controls

A. Education

Develop a system to ensure that hospital patients, personnel, and visitors are educated about use of precautions and their responsibility for adherence to them. Category IB

B. Adherence to Precautions

Periodically evaluate adherence to precautions, and use findings to direct improvements. Category IB

II. Standard Precautions

Use Standard Precautions, or the equivalent, for the care of all patients. Category IB

A. Handwashing

(1) Wash hands after touching blood, body fluids, secretions, excretions, and contaminated items, whether or not gloves are worn. Wash hands immediately after gloves are removed, between patient contacts, and when otherwise indicated to avoid transfer of microorganisms to other patients or environments. It may be necessary to wash hands between tasks and procedures on the same patient to prevent cross-contamination of different body sites. Category IB

(2) Use a plain (nonantimicrobial) soap for routine handwashing. Category IB

(3) Use an antimicrobial agent or a waterless antiseptic agent for specific circumstances (e.g., control of outbreaks or hyperendemic infections), as defined by the infection control program. Category IB (See Contact Precautions for additional recommendations on using antimicrobial and antiseptic agents.)

B. Gloves

Wear gloves (clean, nonsterile gloves are adequate) when touching blood, body fluids, secretions, excretions, and contaminated items. Put on clean gloves just before touching mucous membranes and nonintact skin. Change gloves between tasks and procedures on the same patient after contact with material that may contain a high concentration of microorganisms. Remove gloves promptly after use, before touching noncontaminated items and environmental surfaces, and before going to another patient, and wash hands immediately to avoid transfer of microorganisms to other patients or environments. Category IB

C. Mask, Eye Protection, Face Shield

Wear a mask and eye protection or a face shield to protect mucous membranes of the eyes, nose, and mouth during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, and excretions. Category IB

D. Gown

Wear a gown (a clean, nonsterile gown is adequate) to protect skin and to prevent soiling of clothing during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, or excretions. Select a gown that is appropriate for the activity and amount of fluid likely to be encountered. Remove a soiled gown as promptly as possible, and wash hands to avoid transfer of microorganisms to other patients or environments. Category IB

E. Patient-Care Equipment

Handle used patient-care equipment soiled with blood, body fluids, secretions, and excretions in a manner that prevents skin and mucous membrane exposures, contamination of clothing, and transfer of microorganisms to other patients and environments. Ensure that reusable equipment is not used for the care of another patient until it has been cleaned and reprocessed appropriately. Ensure that single-use items are discarded properly. Category IB

F. Environmental Control

Ensure that the hospital has adequate procedures for the routine care, cleaning, and disinfection of environmental surfaces, beds, bedrails, bedside equipment, and other frequently touched surfaces, and ensure that these procedures are being followed. Category IB

G. Linen

Handle, transport, and process used linen soiled with blood, body fluids, secretions, and excretions in a manner that prevents skin and mucous membrane exposures and contamination of clothing, and that avoids transfer of microorganisms to other patients and environments. Category IB

H. Occupational Health and Bloodborne Pathogens

(1) Take care to prevent injuries when using needles, scalpels, and other sharp instruments or devices; when handling sharp instruments after procedures; when cleaning used instruments; and when disposing of used needles. Never recap used needles, or otherwise manipulate them using both hands, or use any other technique that involves directing the point of a needle toward any part of the body; rather, use either a one-handed "scoop" technique or a mechanical device designed for holding the needle sheath. Do not remove used needles from disposable syringes by hand, and do not bend, break, or otherwise manipulate used needles by hand. Place used disposable syringes and needles, scalpel blades, and other sharp items in appropriate puncture-resistant containers, which are located as close as practical to the area in which the items were used, and place reusable syringes and needles in a puncture-resistant container for transport to the reprocessing area. Category IB

(2) Use mouthpieces, resuscitation bags, or other ventilation devices as an alternative to mouth-to-mouth resuscitation methods in areas where the need for resuscitation is predictable. Category IB

I. Patient Placement

Place a patient who contaminates the environment or who does not (or cannot be expected to) assist in maintaining appropriate hygiene or environmental control in a private room. If a private room is not available, consult with infection control professionals regarding patient placement or other alternatives. Category IB

III. Airborne Precautions

In addition to Standard Precautions, use Airborne Precautions, or the equivalent, for patients known or suspected to be infected with microorganisms transmitted by airborne droplet nuclei (small-particle residue [5 μm or smaller in size] of evaporated droplets containing microorganisms that remain suspended in the air and that can be dispersed widely by air currents within a room or over a long distance). Category IB

A. Patient Placement

Place the patient in a private room that has 1) monitored negative air pressure in relation to the surrounding areas, 2) 6 to 12 air changes per hour, and 3) appropriate discharge of air outdoors or monitored high-efficiency filtration of room air before the air is circulated to other areas in the hospital. Keep the room door closed and the patient in the room. When a private room is not available, place the patient in a room with a patient who has active infection with the same microorganism, unless otherwise recommended, but with no other infection. When a private room is not available and cohorting is not desirable, consultation with infection control professionals is advised before patient placement. Category IB

B. Respiratory Protection

Wear respiratory protection (N95 respirator) when entering the room of a patient with known or suspected infectious pulmonary tuberculosis. Susceptible persons should not enter the room of patients known or suspected to have measles (rubeola) or varicella (chickenpox) if other immune caregivers are available. If susceptible persons must enter the room of a patient known or suspected to have measles (rubeola) or varicella, they should wear respiratory protection (N95 respirator). Persons immune to measles (rubeola) or varicella need not wear respiratory protection. Category IB

C. Patient Transport

Limit the movement and transport of the patient from the room to essential purposes only. If transport or movement is necessary, minimize patient dispersal of droplet nuclei by placing a surgical mask on the patient, if possible. Category IB

D. Additional Precautions for Preventing Transmission of Tuberculosis

Consult CDC "Guidelines for Preventing the Transmission of Tuberculosis in Health-Care Facilities" for additional prevention strategies.

IV. Droplet Precautions

In addition to Standard Precautions, use Droplet Precautions, or the equivalent, for a patient known or suspected to be infected with microorganisms transmitted by droplets (large-particle droplets [larger than 5 μm in size] that can be generated by the patient during coughing, sneezing, talking, or the performance of procedures). Category IB

A. Patient Placement

Place the patient in a private room. When a private room is not available, place the patient in a room with a patient(s) who has active infection with the same microorganism but with no other infection (cohorting). When a private room is not available and cohorting is not achievable, maintain spatial separation of at least 3 ft between the infected patient and other patients and visitors. Special air handling and ventilation are not necessary, and the door may remain open. Category IB

B. Mask

In addition to wearing a mask as outlined under Standard Precautions, wear a mask when working within 3 ft of the patient. (Logistically, some hospitals may want to implement the wearing of a mask to enter the room.) Category IB

C. Patient Transport

Limit the movement and transport of the patient from the room to essential purposes only. If transport or movement is necessary, minimize patient dispersal of droplets by masking the patient, if possible. Category IB

V. Contact Precautions

In addition to Standard Precautions, use Contact Precautions, or the equivalent, for specified patients known or suspected to be infected or colonized with epidemiologically important microorganisms that can be transmitted by direct contact with the patient (hand or skin-to-skin contact that occurs when performing patient-care activities that require touching the patient's dry skin) or indirect contact (touching) with environmental surfaces or patient-care items in the patient's environment. Category IB

A. Patient Placement

Place the patient in a private room. When a private room is not available, place the patient in a room with a patient(s) who has active infection with the same microorganism but with no other infection (cohorting). When a private room is not available and cohorting is not achievable, consider the epidemiology of the microorganism and the patient population when determining patient placement. Consultation with infection control professionals is advised before patient placement. Category IB

B. Gloves and Handwashing

In addition to wearing gloves as outlined under Standard Precautions, wear gloves (clean, nonsterile gloves are adequate) when entering the room. During the course of providing care for a patient, change gloves after having contact with infective material that may contain high concentrations of microorganisms (fecal material and wound drainage). Remove gloves before leaving the patient's room and wash hands immediately with an antimicrobial agent or a waterless antiseptic agent. After glove removal and handwashing, ensure that hands do not touch potentially contaminated environmental surfaces or items in the patient's room to avoid transfer of microorganisms to other patients or environments. Category IB

C. Gown

In addition to wearing a gown as outlined under Standard Precautions, wear a gown (a clean, nonsterile gown is adequate) when entering the room if you anticipate that your clothing will have substantial contact with the patient, environmental surfaces, or items in the patient's room, or if the patient is incontinent or has diarrhea, an ileostomy, a colostomy, or wound drainage not contained by a dressing. Remove the gown before leaving the patient's environment. After gown removal, ensure that clothing does not contact potentially contaminated environmental surfaces to avoid transfer of microorganisms to other patients or environments. Category IB

D. Patient Transport

Limit the movement and transport of the patient from the room to essential purposes only. If the patient is transported out of the room, ensure that precautions are maintained to minimize the risk of transmission of microorganisms to other patients and contamination of environmental surfaces or equipment. Category IB

E. Patient-Care Equipment

When possible, dedicate the use of noncritical patient-care equipment to a single patient (or cohort of patients infected or colonized with the pathogen requiring precautions) to avoid sharing between patients. If use of common equipment or items is unavoidable, then adequately clean and disinfect them before use for another patient. Category IB

F. Additional Precautions for Preventing the Spread of Vancomycin Resistance

Consult the HICPAC report on preventing the spread of vancomycin resistance for additional prevention strategies.

Appendix 17–2 Revision to OSHA's Bloodborne Pathogens Standard

Technical Background and Summary

April 2001

Background

The Occupational Safety and Health Administration (OSHA) published the Occupational Exposure to Bloodborne Pathogens standard in 1991 because of a significant health risk associated with exposure to viruses and other microorganisms that cause bloodborne diseases. Of primary concern are the human immunodeficiency virus (HIV) and the hepatitis B and hepatitis C viruses.

The standard sets forth requirements for employers with workers exposed to blood or other potentially infectious materials. In order to reduce or eliminate the hazards of occupational exposure, an employer must implement an exposure control plan for the worksite with details on employee protection measures. The plan must also describe how an employer will use a combination of engineering and work practice controls, ensure the use of personal protective clothing and equipment, provide training, medical surveillance, hepatitis B vaccinations, and signs and labels, among other provisions. Engineering controls are the primary means of eliminating or minimizing employee exposure and include the use of safer medical devices, such as needleless devices, shielded needle devices, and plastic capillary tubes.

Nearly 10 years have passed since the bloodborne pathogens standard was published. Since then, many different medical devices have been developed to reduce the risk of needlesticks and other sharps injuries. These devices replace sharps with non-needle devices or incorporate safety features designed to reduce injury. Despite these advances in technology, needlesticks and other sharps injuries continue to be of concern due to the high frequency of their occurrence and the severity of the health effects.

The Centers for Disease Control and Prevention estimate that healthcare workers sustain nearly 600,000 percutaneous injuries annually involving contaminated sharps. In response to both the continued concern over such exposures and the technological developments which can increase employee protection, Congress passed the Needlestick Safety and Prevention Act directing OSHA to revise the bloodborne pathogens standard to establish in greater detail requirements that employers identify and make use of effective and safer medical devices. That revision was published on Jan. 18, 2001, and became effective April 18, 2001.

Summary

The revision to OSHA's bloodborne pathogens standard added new requirements for employers, including additions to the exposure control plan and keeping a sharps injury log. It does not impose new requirements for employers to protect workers from sharps injuries; the original standard already required employers to adopt engineering and work practice controls that would eliminate or minimize employee exposure from hazards associated with bloodborne pathogens.

The revision does, however, specify in greater detail the engineering controls, such as safer medical devices, which must be used to reduce or eliminate worker exposure.

Exposure Control Plan

The revision includes new requirements regarding the employer's Exposure Control Plan, including an annual review and update to reflect changes in technology that eliminate or reduce exposure to bloodborne pathogens. The employer must:

- take into account innovations in medical procedure and technological developments that reduce the risk of exposure (e.g., newly available medical devices designed to reduce needlesticks); and
- document consideration and use of appropriate, commercially-available, and effective safer devices (e.g., describe the devices identified as candidates for use, the method(s) used to evaluate those devices, and justification for the eventual selection).

No one medical device is considered appropriate or effective for all circumstances. Employers must select devices that, based on reasonable judgment:

- will not jeopardize patient or employee safety or be medically inadvisable; and
- will make an exposure incident involving a contaminated sharp less likely to occur.

Employee Input

Employers must solicit input from non-managerial employees responsible for direct patient care regarding the identification, evaluation, and selection of effective

engineering controls, including safer medical devices. Employees selected should represent the range of exposure situations encountered in the workplace, such as those in geriatric, pediatric, or nuclear medicine, and others involved in direct care of patients.

OSHA will check for compliance with this provision during inspections by questioning a representative number of employees to determine if and how their input was requested.

Documentation of Employee Input

Employers are required to document, in the Exposure Control Plan, how they received input from employees. This obligation can be met by:

- Listing the employees involved and describing the process by which input was requested; or
- Presenting other documentation, including references to the minutes of meetings, copies of documents used to request employee participation, or records of responses received from employees.

Recordkeeping

Employers who have employees who are occupationally exposed to blood or other potentially infectious materials, and who are required to maintain a log of occupational injuries and illnesses under existing recordkeeping rules, must also maintain a sharps injury log. That log will be maintained in a manner that protects the privacy of employees. At a minimum, the log will contain the following:

- the type and brand of device involved in the incident;
- location of the incident (e.g., department or work area); and
- description of the incident.

The sharps injury log may include additional information as long as an employee's privacy is protected. The format of the log can be determined by the employer.

Modification of Definitions

The revision to the bloodborne pathogens standard includes modification of definitions relating to engineering controls. Two terms have been added to the standard, while the description of an existing term has been amended.

Engineering Controls

Engineering Controls include all control measures that isolate or remove a hazard from the workplace, such as sharps disposal containers and self-sheathing needles. The original bloodborne pathogens standard was not specific regarding the applicability of various engineering controls (other than the above examples) in the healthcare setting. The revision now specifies that "safer medical devices, such as sharps with engineered sharps injury protections and needleless systems" constitute an effective engineering control, and must be used where feasible.

Sharps with Engineered Sharps Injury Protections

This is a new term which includes non-needle sharps or needle devices containing built-in safety features that are used for collecting fluids or administering medications or other fluids, or other procedures involving the risk of sharps injury. This description covers a broad array of devices, including:

- syringes with a sliding sheath that shields the attached needle after use;
- needles that retract into a syringe after use;
- shielded or retracting catheters; and
- intravenous medication (IV) delivery systems that use a catheter port with a needle housed in a protective covering.

Needleless Systems

This is a new term defined as devices which provide an alternative to needles for various procedures to reduce the risk of injury involving contaminated sharps. Examples include:

- IV medication systems which administer medication or fluids through a catheter port using non-needle connections; and
- jet injection systems which deliver liquid medication beneath the skin or through a muscle.

APPENDIX 18

Recommended Immunization Schedules

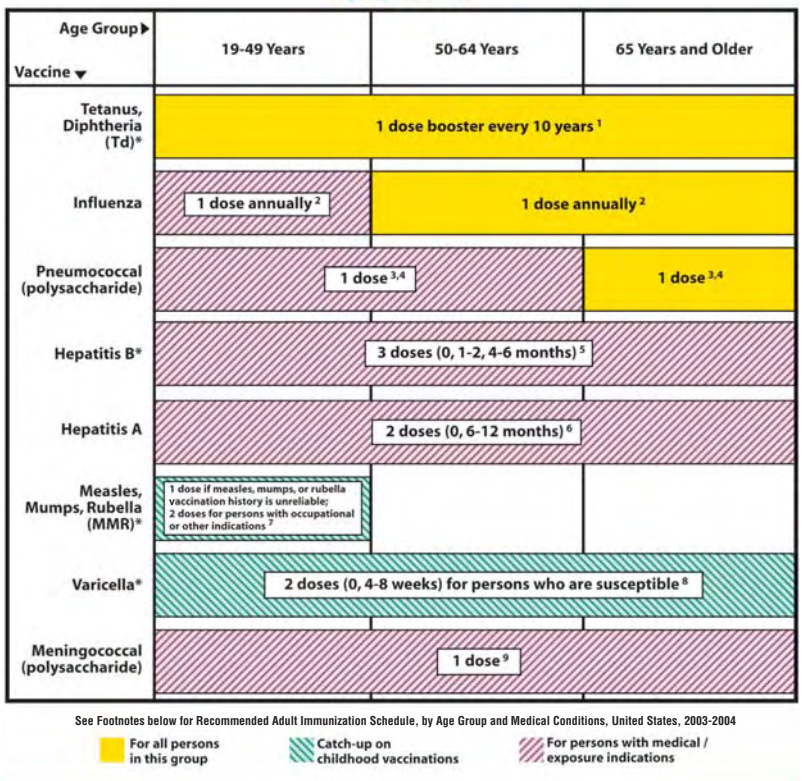
Recommended Adult Immunization Schedule by Age Group and Medical Conditions United States, 2003-2004

Summary of Recommendations Published by

The Advisory Committee on Immunization Practices

Department of Health and Human Services
Centers for Disease Control and Prevention

Recommended Adult Immunization Schedule, United States, 2003-2004 by Age Group



*Covered by the Vaccine Injury Compensation Program. For information on how to file a claim, call 800-338-2382. Please also visit www.hrsa.gov/osp/vicp. To file a claim for vaccine injury contact: U.S. Court of Federal Claims, 717 Madison Place, N.W., Washington D.C.20005, 202-219-9657.

This schedule indicates the recommended age groups for routine administration of currently licensed vaccines for persons 19 years of age and older. Licensed combination vaccines may be used whenever any components of the combination are indicated and the vaccine's other components are not contraindicated. Providers should consult the manufacturers' package inserts for detailed recommendations.

Report all clinically significant post-vaccination reactions to the Vaccine Adverse Event Reporting System (VAERS). Reporting forms and instructions on filing a VAERS report are available by calling 800-822-7967 or from the VAERS website at *www.vaers.org.*

For additional information about the vaccines listed above and contraindications for immunization, visit the National Immunization Program Website at *www.cdc.gov/nip/* or call the National Immunization Hotline at 800-232-2522 (English) or 800-232-0233 (Spanish).

Approved by the Advisory Committee on Immunization Practices (ACIP)
and accepted by the American College of Obstetricians and Gynecologists (ACOG)
and the American Academy of Family Physicians (AAFP)

Recommended Adult Immunization Schedule, United States, 2003-2004
by Medical Conditions

Medical Conditions ▼ / Vaccine ▶	Tetanus-Diphtheria (Td)*,1	Influenza 2	Pneumococcal (polysaccharide) 3,4	Hepatitis B*,5	Hepatitis A6	Measles, Mumps, Rubella (MMR)*,7	Varicella*,8

See Special Notes for Medical Conditions below–also see Footnotes for Recommended Adult Immunization Schedule, by Age Group & Medical Conditions, US, 2003-04

For all persons in this group · Catch-up on childhood vaccinations · For persons with medical / exposure indications · Contraindicated

Special Notes for Medical Conditions

A. For women without chronic diseases/conditions, vaccinate if pregnancy will be at 2nd or 3rd trimester during influenza season. For women with chronic diseases/conditions, vaccinate at any time during the pregnancy.

B. Although chronic liver disease and alcoholism are not indicator conditions for influenza vaccination, give 1 dose annually if the patient is ≥ 50 years, has other indications for influenza vaccine, or requests vaccination.

C. Asthma is an indicator condition for influenza but not for pneumococcal vaccination.

D. For all persons with chronic liver disease.

E. For persons <65 years, revaccinate once after 5 years or more have elapsed since initial vaccination.

F. Persons with impaired humoral immunity but intact cellular immunity may be vaccinated. *MMWR* 1999; 48 (RR-06): 1–5.

G. Hemodialysis patients: Use special formulation of vaccine (40 μg/mL) or two 1.0 mL 20 μg doses given at one site. Vaccinate early in the course of renal disease. Assess antibody titers to hepatitis B surface antigen (anti-HBs) levels annually. Administer additional doses if anti-HBs levels decline to <10 milli-international units (mIU)/ mL.

H. There are no data specifically on risk of severe or complicated influenza infections among persons with asplenia. However, influenza is a risk factor for secondary bacterial infections that may cause severe disease in asplenics.

I. Administer meningococcal vaccine and consider Hib vaccine.

J. Elective splenectomy: vaccinate at least 2 weeks before surgery.

K. Vaccinate as close to diagnosis as possible when CD4 cell counts are highest.

L. Withhold MMR or other measles containing vaccines from HIV-infected persons with evidence of severe immunosuppression. *MMWR* 1998; 47 (RR-8): 21–22; *MMWR* 2002; 51 (RR-02): 22–24.

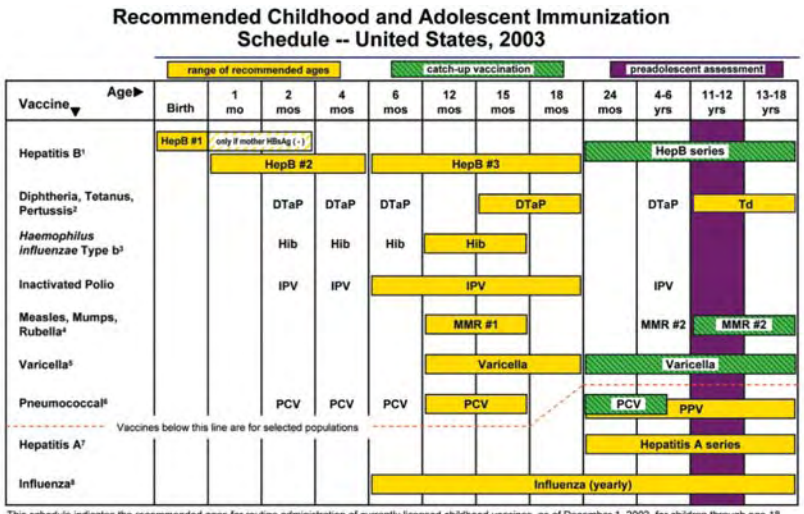
Footnotes for

Recommended Adult Immunization Schedule by Age Group and Medical Conditions, United States, 2003–2004

1. **Tetanus and diphtheria (Td)**—Adults including pregnant women with uncertain histories of a complete primary vaccination series should receive a primary series of Td. A primary series for adults is 3 doses: the first 2 doses given at least 4 weeks apart and the 3rd dose, 6–12 months after the second. Administer 1 dose if the person had received the primary series and the last vaccination was 10 years ago or longer. Consult *MMWR* 1991;40 (RR-10): 1–21 for administering Td as prophylaxis in wound management. The ACP Task Force on Adult Immunization supports a second option for Td use in adults: a single Td booster at age 50 years for persons who have completed the full pediatric series, including the teenage/young adult booster. *Guide for Adult Immunization.* 3rd ed. ACP 1994: 20.
2. **Influenza vaccination**—Medical indications: chronic disorders of the cardiovascular or pulmonary systems including asthma; chronic metabolic diseases such as diabetes mellitus, renal dysfunction, hemoglobinopathies, or immunosuppression (including immunosuppression caused by medications or by human immunodeficiency virus [HIV]) requiring regular medical follow-up or hospitalization during the preceding year; women who will be in the second or third trimester of pregnancy during the influenza season. Occupational indications: healthcare workers. Other indications: residents of nursing homes and other long-term care facilities; persons likely to transmit influenza to persons at high-risk (in-home care givers to persons with medical indications, household contacts and out-of-home caregivers of children from birth to 23 months of age, or children with asthma or other indicator conditions for influenza vaccination, household members and care givers of elderly and adults with high-risk conditions); and anyone who wishes to be vaccinated. For healthy persons aged 5–49 years without high-risk conditions, either the inactivated vaccine or the intranasally administered influenza vaccine (Flumist) may be given. *MMWR* 2003; 52 (RR-8): 1–36; *MMWR* 2003;53 (RR-13): 1–8.
3. **Pneumococcal polysaccharide vaccination**—Medical indications: chronic disorders of the pulmonary system (excluding asthma), cardiovascular diseases, diabetes mellitus, chronic liver diseases including liver disease as a result of alcohol abuse (e.g., cirrhosis), chronic renal failure or nephrotic syndrome, functional or anatomic asplenia (e.g., sickle cell disease or splenectomy), immunosuppressive conditions (e.g., congenital immunodeficiency, HIV infection, leukemia, lymphoma, multiple myeloma, Hodgkin's disease, generalized malignancy, organ or bone marrow transplantation), chemotherapy with alkylating agents, anti-metabolites, or long-term systemic corticosteroids. Geographic/other indications: Alaskan Natives and certain American Indian populations. Other indications: residents of nursing homes and other long-term care facilities. *MMWR* 1997;46 (RR-8): 1–24.
4. **Revaccination with pneumococcal polysaccharide vaccine**—One time revaccination after 5 years for persons with chronic renal failure or nephrotic syndrome, functional or anatomic asplenia (e.g., sickle cell disease or splenectomy), immunosuppressive conditions (e.g., congenital immunodeficiency, HIV infection, leukemia, lymphoma, multiple myeloma, Hodgkin's disease, generalized malignancy, organ or bone marrow transplantation), chemotherapy with alkylating agents, antimetabolites, or long-term systemic corticosteroids. For persons 65 and older, one-time revaccination if they were vaccinated 5 or more years previously and were aged less than 65 years at the time of primary vaccination. *MMWR* 1997; 46 (RR-8): 1–24.
5. **Hepatitis B vaccination**—Medical indications: hemodialysis patients, patients who receive clotting-factor concentrates. Occupational indications: health-care workers and public-safety workers who have exposure to blood in the workplace, persons in training in schools of medicine, dentistry, nursing, laboratory technology, and other allied health professions. Behavioral indications: injecting drug users, persons with more than one sex partner in the previous 6 months, persons with a recently acquired sexually-transmitted disease (STD), all clients in STD clinics, men who have sex with men. Other indications: household contacts and sex partners of persons with chronic HBV infection, clients and staff of institutions for the developmentally disabled, international travelers who will be in countries with high or intermediate prevalence of chronic HBV infection for more than 6 months, inmates of correctional facilities. *MMWR* 1991; 40 (RR-13): 1–19. *(www.cdc.gov/ travel/diseases/hbv.htm)*
6. **Hepatitis A vaccination**—For the combined HepA-HepB vaccine use 3 doses at 0, 1, 6 months). Medical indications: persons with clotting-factor disorders or chronic liver disease. Behavioral indications: men who have sex with men, users of injecting and noninjecting illegal drugs. Occupational indications: persons working with HAV-infected primates or with HAV in a research laboratory setting. Other indications: persons traveling to or working in countries that have high or intermediate endemicity of hepatitis A. *MMWR* 1999; 48 (RR-12): 1–37. *(www.cdc.gov/travel/diseases/hav.htm)*
7. **Measles, Mumps, Rubella vaccination (MMR)**—Measles component: Adults born before 1957 may be considered immune to measles. Adults born in or after 1957 should receive at least one dose of MMR unless they have a medical contraindication, documentation of at least one dose or other acceptable evidence of immunity. A second dose of MMR is recommended for adults who:
   - are recently exposed to measles or in an outbreak setting
   - were previously vaccinated with killed measles vaccine
   - were vaccinated with an unknown vaccine between 1963 and 1967
   - are students in post-secondary educational institutions
   - work in health care facilities
   - plan to travel internationally

   Mumps component: 1 dose of MMR should be adequate for protection. Rubella component: Give 1 dose of MMR to women whose rubella vaccination history is unreliable and counsel women to avoid becoming pregnant for 4 weeks after vaccination. For women of child-bearing age, regardless of birth year, routinely determine rubella immunity and counsel women regarding congenital rubella syndrome. Do not vaccinate pregnant women or those planning to become pregnant in the next 4 weeks. If pregnant and susceptible, vaccinate as early in postpartum period as possible. *MMWR* 1998; 47 (RR-8): 1–57; *MMWR* 2001;50: 1117.
8. **Varicella vaccination**—Recommended for all persons who do not have reliable clinical history of varicella infection or serological evidence of varicella zoster virus (VZV) infection who may be at high risk for exposure or transmission. This includes health-care workers and family contacts of immunocompromised persons, those who live or work in environments where transmission is likely (e.g., teachers of young children, day care employees, and residents and staff members in institutional settings), persons who live or work in environments where VZV transmission can occur (e.g., college students, inmates and staff members of correctional institutions, and military personnel), adolescents and adults living in households with children, women who are not pregnant but who may become pregnant in the future, international travelers who are not immune to infection. Note: Greater than 95% of U.S. born adults are immune to VZV. Do not vaccinate pregnant women or those planning to become pregnant in the next 4 weeks. If pregnant and susceptible, vaccinate as early in postpartum period as possible. *MMWR* 1996; 45 (RR-11): 1–36; *MMWR* 1999; 48 (RR-6): 1–5.
9. **Meningococcal vaccine (quadrivalent polysaccharide for serogroups A, C, Y, and W-135)**—Consider vaccination for persons with medical indications: adults with terminal complement component deficiencies, with anatomic or functional asplenia. Other indications: travelers to countries in which disease is hyperendemic or epidemic ("meningitis belt" of sub-Saharan Africa, Mecca, Saudi Arabia for Hajj). Revaccination at 3–5 years may be indicated for persons at high risk for infection (e.g., persons residing in areas in which disease is epidemic). Counsel college freshmen, especially those who live in dormitories, regarding meningococcal disease and the vaccine so that they can make an educated decision about receiving the vaccination. *MMWR* 2000; 49 (RR-7): 1–20. Note:The AAFP recommends that colleges should take the lead on providing education on meningococcal infection and vaccination and offer it to those who are interested. Physicians need not initiate discussion of the meningococcal quadravalent polysaccharide vaccine as part of routine medical care.

Recommended Childhood and Adolescent Immunization Schedule -- United States, 2003



This schedule indicates the recommended ages for routine administration of currently licensed childhood vaccines, as of December 1, 2002, for children through age 18 years. Any dose not given at the recommended age should be given at any subsequent visit when indicated and feasible. Indicates age groups that warrant special effort to administer those vaccines not previously given. Additional vaccines may be licensed and recommended during the year. Licensed combination vaccines may be used whenever any components of the combination are indicated and the vaccine's other components are not contraindicated. Providers should consult the manufacturers' package inserts for detailed recommendations.

1. Hepatitis B vaccine (HepB). All infants should receive the first dose of hepatitis B vaccine soon after birth and before hospital discharge; the first dose may also be given by age 2 mo if the infant's mother is HBsAg-negative. Only monovalent HepB can be used for the birth dose. Monovalent or combination vaccine containing HepB may be used to complete the series. Four doses of vaccine may be administered when a birth dose is given. The second dose should be given at least 4 wk after the first dose, except for combination vaccines which cannot be administered before age 6 wk. The third dose should be given at least 16 wk after the first dose and at least 8 wk after the second dose. The last dose in the vaccination series (third or fourth dose) should not be administered before age 6 mo.

Infants born to HBsAg-positive mothers should receive HepB and 0.5 mL Hepatitis B Immune Globulin (HBIG) within 12 hr of birth at separate sites. The second dose is recommended at age 1-2 mo. The last dose in the vaccination series should not be administered before age 6 mo. These infants should be tested for HBsAg and anti-HBs at 9-15 mo of age.

Infants born to mothers whose HBsAg status is unknown should receive the first dose of the HepB series within 12 hr of birth. Maternal blood should be drawn as soon as possible to determine the mother's HBsAg status; if the HBsAg test is positive, the infant should receive HBIG as soon as possible (no later than age 1 wk). The second dose is recommended at age 1-2 mo. The last dose in the vaccination series should not be administered before age 6 mo.

2. Diphtheria and tetanus toxoids and acellular pertussis vaccine (DTaP). The fourth dose of DTaP may be administered as early as age 12 mo, provided 6 mo have elapsed since the third dose and the child is unlikely to return at age 15–18 mo. **Tetanus and diphtheria toxoids (Td)** is recommended at age 11–12 yr if at least 5 yr have elapsed since the last dose of tetanus and diphtheria toxoid-containing vaccine. Subsequent routine Td boosters are recommended every 10 yr.

3. *Haemophilus influenzae* type b (Hib) conjugate vaccine. Three Hib conjugate vaccines are licensed for infant use. If PRP-OMP (PedvaxHIB® or ComVax® [Merck]) is administered at ages 2 and 4 mo, a dose at age 6 mo is not required. DTaP/Hib combination products should not be used for primary immunization in infants at ages 2, 4 or 6 mo, but can be used as boosters following any Hib vaccine.

4. Measles, mumps, and rubella vaccine (MMR). The second dose of MMR is recommended routinely at age 4-6 yr but may be administered during any visit, provided at least 4 wk have elapsed since the first dose and that both doses are administered beginning at or after age 12 mo. Those who have not previously received the second dose should complete the schedule by the 11-12 yr old visit.

5. Varicella vaccine. Varicella vaccine is recommended at any visit at or after age 12 mo for susceptible children, i.e., those who lack a reliable history of chickenpox. Susceptible persons age ≥13 yr should receive two doses, given at least 4 wk apart.

6. Pneumococcal vaccine. The heptavalent **pneumococcal conjugate vaccine (PCV)** is recommended for all children age 2-23 mo. It is also recommended for certain children age 24-59 mo. **Pneumococcal polysaccharide vaccine (PPV)** is recommended in addition to PCV for certain high-risk groups. See *MMWR* 2000;49(RR-9);1-38.

7. Hepatitis A vaccine. Hepatitis A vaccine is recommended for children and adolescents in selected states and regions, and for certain high-risk groups; consult your local public health authority. Children and adolescents in these states, regions, and high risk groups who have not been immunized against hepatitis A can begin the hepatitis A vaccination series during any visit. The two doses in the series should be administered at least 6 mo apart. See *MMWR* 1999;48(RR-12);1-37.

8. Influenza vaccine. Influenza vaccine is recommended annually for children age ≥6 mo with certain risk factors (including but not limited to asthma, cardiac disease, sickle cell disease, HIV, diabetes, and household members of persons in groups at high risk; see *MMWR* 2002;51(RR-3);1-31) and can be administered to all others wishing to obtain immunity. In addition, healthy children age 6-23 mo are encouraged to receive influenza vaccine if feasible because children in this age group are at substantially increased risk for influenza-related hospitalizations. Children age ≤12 yr should receive vaccine in a dosage appropriate for their age (0.25 mL if age 6-35 mo or 0.5 mL if age ≥3 yr). Children age ≤8 yr who are receiving influenza vaccine for the first time should receive two doses separated by at least 4 wk.

For additional information about vaccines, including precautions and contraindications for immunization and vaccine shortages, please visit the National Immunization Program Website at *www.cdc. gov/nip* or call the National Immunization Information Hotline at 800-232-2522 (English) or 800-232-0233 (Spanish).

Approved by the Advisory Committee on Immunization Practices *(www.cdc.gov/nip/acip)***, the American Academy of Pediatrics** *(www.aap.org)***, and the American Academy of Family Physicians** *(www.aafp.org).*

APPENDIX N2

Conceptual Models and Theories of Nursing

Jacqueline Fawcett, PhD, FAAN

Appendix N2–1 The Forerunners

FLORENCE NIGHTINGALE'S NOTES ON NURSING

Overview

Nightingale maintained that *every* woman is a nurse because every woman, at one time or another in her life, has charge of the personal health of someone. Nightingale equated knowledge of nursing with knowledge of sanitation. The focus of nursing knowledge was how to keep the body free from disease or in such a condition that it could recover from disease. According to Nightingale, nursing ought to signify the proper use of fresh air, light, warmth, cleanliness, quiet, and the proper selection and administration of diet—all at the least expense of vital power to the patient. That is, she maintained that the purpose of nursing was to put patients in the best condition for nature to act upon them.

Implications for Nursing Practice

Nursing practice encompasses care of both well and sick people. Nursing actions focus on both patients and their environments. Thirteen "hints" provided the boundaries of nursing practice:

1. **Ventilation and warming**—the nurse must be concerned first with keeping the air that patients breathe as pure as the external air, without chilling them.
2. **Health of houses**—attention to pure air, pure water, efficient drainage, cleanliness, and light will secure the health of houses.
3. **Petty management**—all the results of good nursing may be negated by one defect: not knowing how to manage what you do when you are there and what shall be done when you are not there.
4. **Noise**—unnecessary noise, or noise that creates an expectation in the mind, is that which hurts patients. Anything that wakes patients suddenly out of their sleep will invariably put them into a state of greater excitement and do them more serious and lasting mischief than any continuous noise, however loud.
5. **Variety**—the nerves of the sick suffer from seeing the same walls, the same ceiling, the same surroundings during a long confinement to one or two rooms. The majority of cheerful cases are to be found among those patients who are not confined to one room, whatever their suffering, and the majority of depressed cases will be seen among those subjected to a long monotony of objects about them.
6. **Taking food**—the nurse should be conscious of patients' diets and remember how much food each patient has had and ought to have each day.
7. **What food?**—to watch for the opinions the patient's stomach gives, rather than to read "analyses of foods," is the business of all those who have to decide what the patient should eat.
8. **Bed and bedding**—the patient should have a clean bed every 12 hours. The bed should be narrow, so that the patient does not feel "out of humanity's reach." The bed should not be so high that the patient cannot easily get in and out of it. The bed should be in the lightest spot in the room, preferably near a window. Pillows should be used to support the back below the breathing apparatus, to allow shoulders room to fall back, and to support the head without throwing it forward.
9. **Light**—with the sick, second only to their need of fresh air is their need of light. Light, especially direct sunlight, has a purifying effect upon the air of a room.
10. **Cleanliness of rooms and walls**—the greater part of nursing consists in preserving cleanliness. The inside air can be kept clean only by excessive care to rid rooms and their furnishings of the organic matter and dust with which they become saturated. Without cleanliness, you cannot have all the effects of ventilation; without ventilation, you can have no thorough cleanliness.
11. **Personal cleanliness**—nurses should always remember that if they allow patients to remain unwashed or to remain in clothing saturated with perspiration or

other excretion, they are interfering injuriously with the natural processes of health just as much as if they were to give their patients a dose of slow poison.

12. **Chattering hopes and advices**—there is scarcely a greater worry which invalids have to endure than the incurable hopes of their friends. All friends, visitors, and attendants of the sick should avoid the practice of attempting to cheer the sick by making light of their danger and by exaggerating their probabilities of recovery.
13. **Observation of the sick**—the most important practical lesson nurses can learn is what to observe, how to observe, which symptoms indicate improvement, which indicate the reverse, which are important, which are not, and which are the evidence of neglect and what kind of neglect.

Implications for Nursing Education

Nightingale's primary contribution to nursing education was her belief that nursing schools should be administratively and economically independent from hospitals, even though the training could take place in the hospital. The purpose of nursing education was to teach the theoretical and practical knowledge underlying physician's orders. Knowledge of the 13 "hints" for nursing practice was considered an essential part of the training of every nurse.

VIRGINIA HENDERSON'S DEFINITION OF NURSING

Overview

The unique function of the nurse is to help individuals, sick or well, to perform those activities contributing to health or its recovery (or to peaceful death) that they would perform unaided if they had the necessary strength, will, or knowledge, and to do this in such a way as to help them gain independence as soon as possible.

Implications for Nursing Practice

The practice of nursing requires nurses to know and understand patients by putting themselves in the place of the patients. Nurses should not take at face value everything that patients say, but rather should interact with patients to ascertain their true feelings. *Basic nursing care* involves helping the patient perform the following activities unaided:

1. Breathe normally.
2. Eat and drink adequately.
3. Eliminate body wastes.
4. Move and maintain desirable postures.
5. Sleep and rest.
6. Select suitable clothes and dress and undress.
7. Maintain body temperature within normal range by adjusting clothing and modifying the environment.
8. Keep the body clean and well groomed and protect the integument.
9. Avoid dangers in the environment and avoid injuring others.
10. Communicate with others in expressing emotions, needs, fears, or opinions.
11. Worship according to one's faith.
12. Work in such a way that there is a sense of accomplishment.
13. Play or participate in various forms of recreation.
14. Learn, discover, or satisfy the curiosity that leads to normal development and health and use the available health facilities.

Implications for Nursing Education

Henderson's definition of nursing identifies an area of health and human welfare in which the nurse is an expert and independent practitioner. This kind of nursing requires a liberal education within a college or university, with grounding in the physical, biological, and social sciences and ability to use analytic processes. The professional aspects of the curriculum should focus on the nurse's major function of supplementing patients when they need strength, will, or knowledge in performing daily activities or in carrying out prescribed therapy, with emphasis on the individualization of patient care.

Appendix N2–2 Conceptual Models

A conceptual model is defined as a set of relatively abstract and general concepts that address the phenomena of central interest to a discipline, the propositions that broadly describe those concepts, and the propositions that state relatively abstract and general relations between two or more of the concepts. Conceptual models of nursing, which also are referred to as conceptual frameworks, conceptual systems, and paradigms, provide distinctive frames of reference for thinking about human beings, their environments, their health, and nursing.

DOROTHY JOHNSON'S BEHAVIORAL SYSTEM MODEL

Overview

Focus is on the person as a behavioral system, made up of all the patterned, repetitive, and purposeful ways of behavior that characterize life. Seven subsystems carry out specialized tasks or functions needed to maintain the integrity of the whole behavioral system and to manage its relationship to the environment:

1. **Attachment or affiliative**—function is the security needed for survival as well as social inclusion, intimacy, and formation and maintenance of social bonds.
2. **Dependency**—function is the succoring behavior that calls for a response of nurturance as well as approval, attention or recognition, and physical assistance.
3. **Ingestive subsystem**—function is appetite satisfaction in terms of when, how, what, how much, and under what conditions the individual eats, all of which is governed by social and psychological considerations as well as biological requirements for food and fluids.
4. **Eliminative**—function is elimination in terms of when, how, and under what conditions the individual eliminates wastes.
5. **Sexual**—functions are procreation and gratification, with regard to behaviors dependent upon the individual's biological sex and gender role identity, including but not limited to courting and mating.
6. **Aggressive**—function is protection and preservation of self and society.
7. **Achievement**—function is mastery or control of some aspect of self or environment, with regard to intellectual, physical, creative, mechanical, social, and care-taking (of children, partner, home) skills.

The *structure* of each subsystem includes four elements:

1. **Drive or goal**—the motivation for behavior.
2. **Set**—the individual's predisposition to act in certain ways to fulfill the function of the subsystem.
3. **Choice**—the individual's total behavioral repertoire for fulfilling subsystem functions, which encompasses the scope of action alternatives from which the person can choose.
4. **Action**—the individual's actual behavior in a situation. Action is the only structural element that can be observed directly; all other elements must be inferred from the individual's actual behavior and from the consequences of that behavior.

Three *functional requirements* are needed by each subsystem to fulfill its functions:

1. **Protection** from noxious influences with which the system cannot cope.
2. **Nurturance** through the input of appropriate supplies from the environment.
3. **Stimulation** to enhance growth and prevent stagnation.

Implications for Nursing Practice

Nursing practice is directed toward restoration, maintenance, or attainment of behavioral system balance and dynamic stability at the highest possible level for the individual. Johnson's practice methodology, which is called the Nursing Diagnostic and Treatment Process, encompasses four steps:

1. **Determination of the existence of a problem** The nurse obtains past and present family and individual behavioral system histories by means of interviews,

structured and unstructured observations, and objective methodologies. The nurse obtains data about the nature of behavioral system functioning in terms of the efficiency and effectiveness with which the client's goals are obtained. The nurse obtains data to determine the degree to which the behavior is purposeful, orderly, and predictable. The nurse interviews the client and family to determine the condition of the subsystem structural components and uses the obtained data to: make inferences about drive strength, direction, and value; make inferences about the solidity and specificity of the set; make inferences about the range of behavior patterns available to the client; make inferences about the usual behavior in a given situation. The nurse assesses and compares the client's behavior with the following indices for behavioral system balance and stability: the behavior is succeeding to achieve the consequences sought; effective motor, expressive, or social skills are evident; the behavior is purposeful; the behavior is orderly; the behavior is predictable; the amount of energy expended to achieve desired goals is acceptable; the behavior reflects appropriate choices; the client is sufficiently satisfied with the behavior; the nurse makes inferences about the organization, interaction, and integration of the subsystems.

2. **Diagnostic classification of problems** *Internal Subsystem Problems* are present when: functional requirements are not met; inconsistency or disharmony among the structural components of subsystems is evident; the behavior is inappropriate in the ambient culture. *Intersystem Problems* are present when: the entire behavioral system is dominated by one or two subsystems; a conflict exists between two or more subsystems.
3. **Management of nursing problems** The general goals of action are to: restore, maintain, or attain the client's behavioral system balance and stability; help the client to achieve a more optimum level of balance and functioning when this is possible and desired. The nurse determines what nursing is to accomplish on behalf of the behavioral system by determining who makes the judgment regarding the acceptable level of behavioral system balance and stability. The nurse identifies the value system of the nursing profession as well as his or her own explicit value system.

   The nurse negotiates with the client to select a type of treatment: The nurse temporarily *Imposes External Regulatory or Control Mechanisms* by: setting limits for behavior by either permissive or inhibitory means; inhibiting ineffective behavioral responses; assisting the client to acquire new responses; reinforcing appropriate behaviors. The nurse *Repairs Damaged Structural Components* in the desirable direction by: reducing drive strength by changing attitudes; redirecting goals by changing attitudes; altering set by instruction or counseling; adding choices by teaching new skills. The nurse *Fulfills Functional Requirements* of the subsystems by: protecting the client from overwhelming noxious influences; supplying adequate nurturance through an appropriate input of essential supplies; providing stimulation to enhance growth and to inhibit stagnation. The nurse negotiates the treatment modality with the client by: establishing a contract with the client; helping the client to understand the meaning of the nursing diagnosis and the proposed treatment. If the diagnosis and/or proposed treatment is rejected, the nurse continues to negotiate with the client until agreement is reached.
4. **Evaluation of behavioral system balance and stability** The nurse compares the client's behavior after treatment to indices of behavioral system balance and stability.

Implications for Nursing Education

Education for nursing practice requires a thorough grounding in the natural and social sciences, with emphasis on the genetic, neurological, and endocrine bases of behavior; psychological and social mechanisms for the regulation and control of behavior; social learning theories; and motivational structures and processes. The professional aspects of the curriculum focus on study of the behavioral system as a whole and as a composite of subsystems; pathophysiology; the clinical sciences of nursing and medicine; and the health care system.

IMOGENE KING'S GENERAL SYSTEMS FRAMEWORK

Overview

Focus is on the continuing ability of individuals to meet their basic needs so that they may function in their socially defined roles, and on individuals' interactions within three open, dynamic, interacting systems.

1. **Personal systems** are individuals, who are regarded as rational, sentient, social beings. Concepts related to the personal system are:
   Perception— a process of organizing, interpreting, and transforming information from sense data and memory that gives meaning to one's experience, represents one's image of reality, and influences one's behavior.
   Self— a composite of thoughts and feelings that constitute a person's awareness of individual existence, of who and what he or she is.
   Growth and development— cellular, molecular, and behavioral changes in human beings that are a function of genetic endowment, meaningful and satisfying experiences, and an environment conducive to helping individuals move toward maturity.
   - *Body image*—a person's perceptions of his or her body.
   - *Time*—the duration between the occurrence of one event and the occurrence of another event.
   - *Space*—the physical area called territory that exists in all directions.
   - *Learning*—gaining knowledge.
2. **Interpersonal systems** are composed of two, three, or more individuals interacting in a given situation. The concepts associated with this system are:
   - *Interactions*—the acts of two or more persons in mutual presence; a sequence of verbal and nonverbal behaviors that are goal directed.
   - *Communication*—the vehicle by which human relations are developed and maintained; encompasses intrapersonal, interpersonal, verbal, and nonverbal communication.
   - *Transaction*—a process of interaction in which human beings communicate with the environment to achieve goals that are valued; goal-directed human behaviors.
   - *Role*—a set of behaviors expected of a person occupying a position in a social system.
   - *Stress*—a dynamic state whereby a human being interacts with the environment to maintain balance for growth, development, and performance, involving an exchange of energy and information between the person and the environment for regulation and control of stressors.
   - *Coping*—a way of dealing with stress.
3. **Social systems** are organized boundary systems of social roles, behaviors, and practices developed to maintain values and the mechanisms to regulate the practices and roles. The concepts related to social systems are:
   - *Organization*—composed of human beings with prescribed roles and positions who use resources to accomplish personal and organizational goals.
   - *Authority*—a transactional process characterized by active, reciprocal relations in which members' values, backgrounds, and perceptions play a role in defining, validating, and accepting the authority of individuals within an organization.
   - *Power*—the process whereby one or more persons influence other persons in a situation.
   - *Status*—the position of an individual in a group or a group in relation to other groups in an organization.
   - *Decision making*—a dynamic and systematic process by which goal-directed choice of perceived alternatives is made and acted upon by individuals or groups to answer a question and attain a goal.
   - *Control*—being in charge.

Implications for Nursing Practice

Nursing practice is directed toward helping individuals maintain their health so they can function in their roles. King's practice methodology, which is the essence of the Theory of Goal Attainment, is called the Interaction-Transaction Process.

1. **Assessment phase**
   Perception The nurse and the client meet in some nursing situation and perceive each other. Accuracy of perception will depend upon verifying the nurse's in-

ferences with the client. The nurse can use the Goal-Oriented Nursing Record (GONR) throughout the assessment phase.
Judgment The nurse and the client make mental judgments about the other.
Action The nurse and the client take some mental action.
Reaction The nurse and the client mentally react to each one's perceptions of the other.

2. **Disturbance** is the *diagnosis phase* of the interaction-transaction process. The nurse and the client communicate and interact, and the nurse identifies the client's concerns, problems, and disturbances in health. The nurse conducts a nursing history to determine the client's activities of daily living, using the Criterion-Referenced Measure of Goal Attainment Tool (CRMGAT); roles; environmental stressors; perceptions; and values, learning needs, and goals. The nurse records the data from the nursing history on the GONR, the medical history and physical examination data, results of laboratory tests and x-ray examination, and information gathered from other health professionals and the client's family members on the GONR. The nurse also records diagnoses on the GONR.
3. **Planning phase**
   Mutual Goal Setting The nurse and the client interact purposefully to set mutually agreed on goals. The nurse interacts with family members if the client cannot verbally participate in goal setting. Mutual goal setting is based on the nurse's assessment of the client's concerns, problems, and disturbances in health; the nurse's and client's perceptions of the interference; and the nurse's sharing of information with the client and his or her family to help the client attain the goals identified. The nurse records the goals on the GONR.
   Exploration of Means to Achieve Goals The nurse and the client interact purposefully to explore the means to achieve the mutually set goals.
   Agreement on Means to Achieve Goals The nurse and the client interact purposefully to agree on the means to achieve the mutually set goals. The nurse records the nursing orders with regard to the means to achieve goals on the GONR.
4. **Transaction** is the *implementation phase* of the interaction-transaction process. Transaction refers to the valuational components of the interaction. The nurse and the client carry out the measures agreed upon to achieve the mutually set goals. The nurse can use the GONR flow sheet and progress notes to record the implementation of measures used to achieve goals.
5. **Attainment of goals** is the *evaluation phase* of the interaction-transaction process. The nurse and the client identify the outcome of the interaction-transaction process. The outcome is expressed in terms of the client's state of health, or ability to function in social roles. The nurse and the client make a decision with regard to whether the goal was attained and, if necessary, determine why the goal was not attained. The nurse can use the CRMGAT to record the outcome and the GONR to record the discharge summary.

Implications for Nursing Education

The General Systems Framework and the theory of goal attainment lead to a focus on the dynamic interaction of the nurse-client dyad. This focus, in turn, leads to emphasis on nursing student behavior as well as client behavior. The concepts related to the personal, interpersonal, and social systems serve as the theoretical content for nursing courses in associate degree, baccalaureate, and master's nursing programs. The theoretical knowledge is used by students in learning experiences involving concrete nursing situations.

MYRA LEVINE'S CONSERVATION MODEL

Overview

Focus is on conservation of the person's wholeness. Adaptation is the process by which people maintain their wholeness or integrity as they respond to environmental challenges and become congruent with the environment. Sources of challenges are:

1. **Perceptual environment**—encompasses that part of the environment to which individuals respond with their sense organs.
2. **Operational environment**—includes those aspects of the environment that are not directly perceived, such as radiation, odorless and colorless pollutants, and microorganisms.
3. **Conceptual environment**—the environment of language, ideas, symbols, concepts, and invention.

Individuals respond to the environment by means of four integrated processes:

1. *Fight-or-flight mechanism*
2. *Inflammatory-immune* response
3. *Stress* response
4. *Perceptual awareness*— includes the basic orienting, haptic, auditory, visual, and taste-smell systems.

Implications for Nursing Practice

Nursing practice is directed toward promoting wholeness for all people, well or sick. Patients are partners or participants in nursing care and are temporarily dependent on the nurse. The nurse's goal is to end the dependence as quickly as possible. Levine's practice methodology is a nursing process directed toward conservation, which is defined as "keeping together," and consists of three steps:

1. **Trophicognosis**—formulation of a nursing care judgment arrived at by the scientific method. The nurse observes and collects data that will influence nursing practice rather than medical practice. The nurse uses appropriate assessment tools derived from the Conservation Model and data to establish an objective and scientific rationale for nursing practice. The nurse fully understands his or her role in medical and paramedical prescriptions and the basis for the prescribed medical regimen. The nurse consults with the physician to share information and clarify nursing decisions. The nurse understands the basis for the prescribed paramedical regimen and determines the nursing processes required by medical and paramedical treatment. The nurse assesses the patient's *Conservation of Energy* by determining his or her ability to perform necessary activities without producing excessive fatigue. The nurse assesses the patient's *Conservation of Structural Integrity* by determining his or her physical functioning. The nurse assesses the patient's *Conservation of Personal Integrity* by determining his or her moral and ethical values and life experiences. The nurse assesses the patient's *Conservation of Social Integrity* by taking the patient's family members, friends, and conceptual environment into account. The nurse understands the basis for implementation of the nursing care plan, including principles of nursing science, and how to adapt nursing techniques to the unique cluster of needs demonstrated in the individual patient. The nurse identifies the provocative facts within the data collected, that is, the data that provoke attention on the basis of knowledge of the situation. The provocative facts provide the basis for an hypothesis, or trophicognosis.
2. **Intervention/Action**—test of the hypothesis. The nurse implements the nursing care plan within the structure of administrative policy, availability of equipment, and established standards of nursing. The nurse accurately records and transmits evaluation of the patient's response to implementation of the nursing care plan and identifies the general type of nursing intervention required:
   Therapeutic— when nursing intervention influences adaptation favorably or toward renewed social well-being.
   Supportive— when nursing intervention cannot alter the course of the adaptation and can only maintain the status quo or fail to halt a downward course.

Intervention is structured according to four conservation principles:

Principle of conservation of energy— balancing the patient's energy output and energy input to avoid excessive fatigue.

Principle of conservation of structural integrity— focusing attention on healing by maintaining or restoring the structure of the body through prevention of physical breakdown and promotion of healing.

Principle of conservation of personal integrity— maintaining or restoring the individual patient's sense of identity, self-worth and acknowledgment of uniqueness.
Principle of conservation of social integrity— acknowledging patients as social beings and helping them to preserve their places in family, community, and society.

3. **Evaluation of Intervention/Action**—the nurse's evaluation of the effects of the intervention/action. The nurse evaluates the effects of intervention and revises the trophicognosis as necessary. An indicator of the success of nursing interventions is the patient's organismic response.

Implications for Nursing Education

Education focuses on understanding both the person and the environment, with emphasis placed on processes by which the person adapts to environmental challenges. Theoretical and clinical knowledge related to the four conservation principles provides the structure for nursing courses. Students are prepared for the practice of holistic nursing and for lifelong learning.

BETTY NEUMAN'S SYSTEMS MODEL

Overview

Focus is on the wellness of the client system in relation to environmental stress and reactions to stress. The client system, which can be an individual, a family or other group, or a community, is a composite of five interrelated variables:

1. **Physiological variables**—bodily structure and function.
2. **Psychological variables**—mental processes and relationships.
3. **Sociocultural variables**—social and cultural functions.
4. **Developmental variables**—developmental processes of life.
5. **Spiritual variables**—aspects of spirituality on a continuum from complete unawareness or denial to a consciously developed high level of spiritual understanding.

The client system is depicted as a central core, which is a basic structure of survival factors common to the species, surrounded by three types of concentric rings:

1. **Flexible line of defense**—the outermost ring; a protective buffer for the client's normal or stable state that prevents invasion of stressors and keeps the client system free from stressor reactions or symptomatology.
2. **Normal line of defense**—lies between the flexible line of defense and the lines of resistance; represents the client system's normal or usual wellness state.
3. **Lines of resistance**—the innermost concentric rings; involuntarily activated when a stressor invades the normal line of defense. They attempt to stabilize the client system and foster a return to the normal line of defense. If they are effective, the system can reconstitute; if ineffective, death may ensue.

Environment is defined as "all internal and external factors or influences surrounding the client system":

1. **Internal environment**—"all forces or interactive influences internal to or contained solely within the boundaries of the defined client system"; the source of *intrapersonal stressors.*
2. **External environment**—all forces or interactive influences external to or existing outside the defined client system; the source of *interpersonal and extrapersonal stressors.*
3. **Created environment**—subconsciously developed by the client as a symbolic expression of system wholeness. It supersedes and encompasses the internal and external environments, and functions as a subjective safety mechanism that may block the true reality of the environment and the health experience.

Implications for Nursing Practice

Nursing practice is directed toward facilitating optimal wellness through retention, attainment, or maintenance of client system stability. Neuman's practice methodology is the Neuman Systems Model Nursing Process Format, which encompasses three steps:

1. **Nursing diagnosis**—formulated on the basis of assessment of the variables and lines of defense and resistance making up the client system.
2. **Nursing goals**—negotiated with the client for desired prescriptive changes to correct variances from wellness.
3. **Nursing outcomes** The nurse implements nursing interventions through the use of one or more of the three prevention-as-intervention modalities.
   - *Primary Prevention as Intervention*— nursing actions to retain system stability are implemented by: preventing stressor invasion; providing resources to retain or strengthen existing client/client system strengths; supporting positive coping and functioning; desensitizing existing or possible noxious stressors; motivating the client/client system toward wellness; coordinating and integrating interdisciplinary theories and epidemiological input; educating or reeducating the client/client system; using stress as a positive intervention strategy.
   - *Secondary Prevention as Intervention*— nursing actions to attain system stability are implemented by: protecting the client/client system's basic structure; mobilizing and optimizing the client/client system's internal and external resources to attain stability and energy conservation; facilitating purposeful manipulation of stressors and reactions to stressors; motivating, educating, and involving the client/client system in mutual establishment of health care goals; facilitating appropriate treatment and intervention measures; supporting positive factors toward wellness; promoting advocacy by coordination and integration; providing primary preventive intervention as required.
   - *Tertiary Prevention as Intervention*— nursing actions to maintain system stability are implemented by: attaining and maintaining the highest possible level of client/client system wellness and stability during reconstitution; educating, reeducating, and/or reorienting the client/client system as needed; supporting the client/client system toward appropriate goals; coordinating and integrating health services resources; providing primary and/or secondary preventive intervention as required. The nurse evaluates the outcome goals by: confirming attainment of outcome goals with the client/client system; reformulating goals as necessary with the client/client system. The nurse and client/client system set intermediate and long-range goals for subsequent nursing action that are structured in relation to short-term goal outcomes. The nurse uses the Neuman Systems Model Assessment and Intervention Tool, the Neuman Systems Model Nursing Diagnosis Taxonomy, and any other relevant clinical tools to guide collection of data and facilitate documentation of nursing diagnoses, nursing goals, and nursing outcomes.

Implications for Nursing Education

The model is an appropriate curriculum guide for all levels of nursing education. The components of the model serve as curriculum content, including the five variable areas (physiological, psychological, sociocultural, developmental, spiritual), the three categories of stressors (intrapersonal, interpersonal, extrapersonal), and the three prevention-as-intervention modalities (primary, secondary, tertiary).

DOROTHEA OREM'S SELF-CARE FRAMEWORK

Overview

Focus is on patients' deliberate actions to meet their own and dependent others' therapeutic self-care demands and nurses' deliberate actions to implement nursing systems designed to assist individuals and multiperson units who have limitations in their

abilities to provide continuing and therapeutic self-care or care of dependent others. The concepts of Orem's conceptual model are:

1. **Self-care**—behavior directed by individuals to themselves or their environments to regulate factors that affect their own development and functioning in the interests of life, health, or well-being.
2. **Self-care agency**—a complex capability of maturing and mature individuals to determine the presence and characteristics of specific requirements for regulating their own functioning and development, make judgments and decisions about what to do, and perform care measures to meet specific self-care requisites. The person's ability to perform self-care is influenced by 10 *power components:*
   - Ability to maintain attention and exercise requisite vigilance with respect to self as self-care agent and internal and external conditions and factors significant for self-care.
   - Controlled use of available physical energy that is sufficient for the initiation and continuation of self-care operations.
   - Ability to control the position of the body and its parts in the execution of the movements required for the initiation and completion of self-care operations.
   - Ability to reason within a self-care frame of reference.
   - Motivation (i.e., goal orientations for self-care that are in accord with its characteristics and its meaning for life, health, and well-being).
   - Ability to make decisions about care of self and to operationalize these decisions.
   - Ability to acquire technical knowledge about self-care from authoritative sources, to retain it, and to operationalize it.
   - A repertoire of cognitive, perceptual, manipulative, communication, and interpersonal skills adapted to the performance of self-care operations.
   - Ability to order discrete self-care actions or action systems into relationships with prior and subsequent actions toward the final achievement of regulatory goals of self-care.
   - Ability to consistently perform self-care operations, integrating them with relevant aspects of personal, family, and community living.

   The person's ability to perform self-care as well as the kind and amount of self-care required are influenced by 10 internal and external factors called *basic conditioning factors:*
   - Age
   - Gender
   - Developmental state
   - Health state
   - Sociocultural orientation
   - Health care system factors; for example, medical diagnostic and treatment modalities
   - Family system factors
   - Patterns of living including activities regularly engaged in
   - Environmental factors
   - Resource availability and adequacy
3. **Therapeutic self-care demand**—the action demand on individuals to meet three types of self-care requisites:
   - *Universal self-care requisites*— actions that need to be performed to maintain life processes, the integrity of human structure and function, and general well-being.
   - *Developmental self-care requisites*— actions that need to be performed in relation to human developmental processes, conditions, and events and in relation to events that may adversely affect development.
   - *Health deviation self-care requisites*— actions that need to be performed in relation to genetic and constitutional defects, human structural and functional deviations and their effects, and medical diagnostic and treatment measures prescribed or performed by physicians.
4. **Self-care deficit**—the relationship of inadequacy between self-care agency and the therapeutic self-care demand.
5. **Nursing agency**—a complex property or attribute that enables nurses to know and help others to know their therapeutic self-care demands, meet their therapeutic self-care demands, and regulate the exercise or development of their self-care agency.
6. **Nursing system**—a series of coordinated deliberate practical actions performed by nurses and patients directed toward meeting the patient's therapeutic self-care demand and protecting and regulating the exercise or development of the patient's self-care agency.

Implications for Nursing Practice

Nursing practice is directed toward helping people to meet their own and their dependent others' therapeutic self-care demands. Orem's practice methodology encompasses the Professional-Technologic Operations of Nursing Practice:

1. **Case Management Operations**—The nurse uses a case management approach to control, direct, and check each of the nursing diagnostic, prescriptive, regulatory, and control operations. The nurse maintains an overview of the interrelationships between the social, interpersonal, and professional-technologic systems of nursing. The nursing history and other appropriate tools are used for collection and documentation of information and measurement of the quality of nursing. The nurse records appropriate information in the patient's chart and records progress notes as appropriate.
2. **Diagnostic Operations**—The nurse identifies the unit of service for nursing practice as an individual, an individual member of a multiperson unit, or a multiperson unit. The nurse determines why the person needs nursing in collaboration with the patient or family and with continued review of decisions by the patient or family. The nurse collects demographic data about the patient and information about the nature and boundaries of the patient's health care situation and nursing's jurisdiction within those boundaries. The nurse calculates the person's present and future therapeutic self-care demand and determines the person's self-care agency or dependent-care agency. The nurse identifies the influence of power components and basic conditioning factors on the exercise and operability of self-care or dependent-care agency.

   The nurse determines whether the person should be helped to refrain from self-care actions or dependent-care actions for therapeutic purposes and whether the person should be helped to protect already developed self-care or dependent-care capabilities for therapeutic purposes. The nurse determines the person's potential for self-care or dependent-care agency in the future by: identifying the person's ability to increase or deepen self-care or dependent-care knowledge; identifying the person's ability to learn techniques of care; identifying the person's willingness to engage in self-care or dependent-care; identifying the person's ability to effectively and consistently incorporate essential self-care or dependent-care measures into daily living.

   The nurse calculates the self-care deficit or dependent-care deficit by: determining the qualitative or quantitative inadequacy of self-care agency or dependent-care agency in relation to the calculated therapeutic self-care demand; determining the nature of and reasons for the existence of the self-care deficit or dependent-care deficit; specifying the extent of the self-care deficit or dependent-care deficit as complete or partial.

   The nurse states the nursing diagnosis for the individual or a multiperson unit within the context of four levels:
   - Level 1: Focuses on health and well-being, with emphasis on the relationship of self-care and self-care management to the overall life situation.
   - Level 2: Deals with the relationship between the therapeutic self-care demand and self-care agency.
   - Level 3: Expresses the relationship of the action demand by particular self-care requisites to particular self-care operations as influenced by the power components.
   - Level 4: Expresses the influence of the basic conditioning factors on the therapeutic self-care demand and self-care agency.
3. **Prescriptive Operations**—The nurse specifies the means to be used and all measures needed to meet the therapeutic self-care demand, in collaboration with the patient or family. The nurse specifies the roles to be played by the nurse(s), patient, and dependent-care agent(s) in meeting the therapeutic self-care demand and in regulating the patient's exercise or development of self- or dependent-care agency, in collaboration with the patient or family.
4. **Regulatory Operations: Design of Nursing Systems for Performance of Regulatory Operations**—The nurse designs a *nursing system,* which is a series of coordinated deliberate practical actions performed by the nurse and the patient directed toward meeting the patient's therapeutic self-care demand and protecting and regulating the exercise or development of the patient's self- or dependent-care agency, in collaboration with the patient or family.

   The nursing system includes one or more *methods of helping,* which are sequential series of actions that will overcome or compensate for the health-associated limitations of patients to regulate their own or their dependents' functioning and development.

   The selection of the appropriate nursing system is based on the answer to the question of who can or should perform self-care actions, and the determination of the

patient's role (no role, some role) in the production and management of self-care. The *wholly compensatory nursing system* is selected when the patient cannot or should not perform any self-care actions, and thus the nurse must perform them. The *partly compensatory nursing system* is selected when the patient can perform some, but not all, self-care actions. The *supportive-educative nursing system* is selected when the patient can and should perform all self-care actions. A single patient may require one or a sequential combination of the three types of nursing systems. All three nursing systems are most appropriately used with individuals. Multiperson units usually require combinations of the partly compensatory and supportive-educative nursing systems, although it is possible that such multiperson units as families or residence groups would need wholly compensatory nursing systems under some circumstances.

Wholly compensatory nursing system— The nurse accomplishes the patient's therapeutic self-care, compensates for the patient's inability to engage in self-care, and supports and protects the patient. The nurse selects wholly compensatory nursing system subtype 1 for persons unable to engage in any form of deliberate action, including persons who are unable to control their position and movement in space; are unresponsive to stimuli or responsive to internal and external stimuli only through hearing and feeling; are unable to monitor the environment and convey information to others because of loss of motor ability.

The nurse selects the following *method of helping* : Acting for or doing for the patient.

The nurse selects *wholly compensatory nursing system subtype* 2 for persons who are aware and who may be able to make observations, judgments, and decisions about self-care and other matters but cannot or should not perform actions requiring ambulation and manipulative movements.

The nurse selects one or more of the following *methods of helping:* providing a developmental environment; acting for or doing for the patient; supporting the patient psychologically; guiding the patient; teaching the patient.

The nurse selects *wholly compensatory nursing system subtype 3* for persons who are unable to attend to themselves and make reasoned judgments and decisions about self-care and other matters but who can be ambulatory and may be able to perform some measures of self-care with continuous guidance and supervision.

The nurse selects one or more of the following *methods of helping:* providing a developmental environment; guiding the patient; providing support for the patient; acting for or doing for the patient.

Partly compensatory nursing system— The nurse performs some self-care measures for the patient, compensates for self-care limitations of the patient, assists the patient as required, and regulates the patient's self-care agency; the patient performs some self-care measures, regulates self-care agency, and accepts care and assistance from the nurse.

When the nurse selects *partly compensatory nursing system subtype 1*, the patient performs universal measures of self-care and the nurse performs medically prescribed measures and some universal self-care measures. The nurse selects one or more of the following *methods of helping:* acting for or doing for the patient; guiding the patient; supporting the patient; providing a developmental environment; teaching the patient.

When the nurse selects *partly compensatory nursing system subtype 2*, the patient learns to perform some new care measures. The nurse selects one or more of the following *methods of helping:* acting for or doing for the patient; guiding the patient; supporting the patient; providing a developmental environment; teaching the patient.

Supportive-educative nursing system— The nurse regulates the exercise and development of the patient's self-care agency or dependent-care agency; the patient accomplishes self-care or dependent-care and regulates the exercise and development of self-care agency or dependent-care agency.

The nurse selects *supportive-educative nursing system subtype 1* if the patient can perform care measures, and the appropriate methods of helping are guiding the patient and supporting the patient. The nurse selects *supportive-educative nursing system subtype 2* if the patient can perform care measures and the appropriate method of helping is teaching the patient. The nurse selects *supportive-educative nursing system subtype 3* if the patient can perform care measures and the appropriate method of helping is providing a developmental environment. The nurse selects *supportive-educative nursing system subtype 4* if the patient is competent in self-care and the appropriate method of helping is guiding the patient periodically.

5. **Regulatory Operations: Planning for Regulatory Operations**—The nurse specifies what is needed to produce the nursing system(s) selected for the patient.

6. **Regulatory Operations: Production of Regulatory Care**—Nursing systems are produced by means of the actions of nurses and patients during nurse-patient encounters. The nurse produces and manages the designated nursing system(s) and method(s) of helping for as long as the patient's self-care deficit or dependent-care deficit exists. The nurse provides the following direct nursing care operations:
   - Performs and regulates self-care or dependent-care tasks for patients or assists patients with their performance of self- or dependent-care tasks.
   - Coordinates self- or dependent-care task performance so that a unified system of care is produced and coordinated with other components of health care.
   - Helps patients, their families, and others bring about systems of daily living for patients that support the accomplishment of self-care or dependent-care and are, at the same time, satisifying in relation to patients' interests, talents, and goals.
   - Guides, directs, and supports patients in their exercise of, or in the withholding of the exercise of, their self-care agency or dependent-care agency.
   - Stimulates patients' interests in self-care or dependent-care by raising questions and promoting discussions of care problems and issues when conditions permit.
   - Is available to patients at times when questions are likely to arise.
   - Supports and guides patients in learning activities and provides cues for learning as well as instructional sessions.
   - Supports and guides patients as they experience illness or disability and the effects of medical care measures and as they experience the need to engage in new measures of self-care or change their ways of meeting ongoing self-care requisites.

   The nurse carries out the following decision-making operations regarding the continuation of or need for changes in direct nursing care:
   - Monitors and assists patients to monitor themselves to determine if self-care or dependent-care measures were performed and to determine the effects of self-care or dependent-care, the results of efforts to regulate the exercise or development of self-care agency or dependent-care agency, and the sufficiency and efficiency of nursing action directed to these ends.
   - Makes judgments about the sufficiency and efficiency of self-care or dependent-care, the regulation of the exercise or development of self-care agency or dependent-care, and nursing assistance.
   - Makes judgments about the meaning of the results derived from nurses' performance when monitoring patients and judging outcomes of self-care or dependent-care for the well-being of patients. Makes or recommends adjustments in the nursing care system through changes in nurse and patient roles.
7. **Control Operations**—The nurse performs control operations concurrently with or separate from the production of regulatory care. The nurse makes observations and evaluates the nursing system to determine whether:
   - The nursing system that was designed is actually produced.
   - There is a fit between the current prescription for nursing and the nursing system that is being produced.
   - Regulation of the patient's functioning is being achieved through performance of care measures to meet the patient's therapeutic self-care demand.
   - Exercise of the patient's self-care agency or dependent-care agency is being properly regulated.
   - Developmental change is in process and is adequate.
   - The patient is adjusting to any declining powers to engage in self-care or dependent-care.

Implications for Nursing Education

The Self-Care Framework provides a body of knowledge that can be used for curriculum development. The focus of both undergraduate and graduate nursing curricula is on components of self-care, self-care agency, self-care deficits, nursing agency, and nursing systems. Education for clinical skills emphasizes the methods of helping.

MARTHA ROGERS' SCIENCE OF UNITARY HUMAN BEINGS

Overview

Focus is on unitary, irreducible human beings and their environments. The four basic concepts are:

1. **Energy fields**—irreducible, indivisible, pandimensional unitary human beings and environments that are identified by pattern and manifesting characteristics that are specific to the whole and cannot be predicted from knowledge of the parts. Human and environmental energy fields are integral with each other.
2. **Openness**—a characteristic of human and environmental energy fields; energy fields are continuously and completely open.
3. **Pattern**—the distinguishing characteristic of an energy field. Pattern is perceived as a single wave that gives identity to the field. Each human field pattern is unique and is integral with its own unique environmental field pattern. Pattern is an abstraction that cannot be seen; what are seen or experienced are manifestations of field pattern.
4. **Pandimensionality**—a nonlinear domain without spatial or temporal attributes.

The three principles of homeodynamics, which describe the nature of human and environmental energy fields, are:

1. **Resonancy**—asserts that human and environmental fields are identified by wave patterns that manifest continuous change from lower to higher frequencies.
2. **Helicy**—asserts that human and environmental field patterns are continuous, innovative, and unpredictable, and are characterized by increasing diversity.
3. **Integrality**—emphasizes the continuous mutual human field and environmental field process.

Implications for Nursing Practice

Nursing practice is directed toward promoting the health and well-being of all persons, wherever they are. Rogers' practice methodology, which is called the Health Patterning Practice Method, encompasses the following phases:

1. **Pattern Manifestation Knowing—Assessment**—The continuous process of apprehending and identifying manifestations of the human energy field and environmental energy field patterns that relate to current health events. The nurse uses one or more Science of Unitary Human Beings–based research instruments or clinical tools to guide application and documentation of the practice methodology. The nurse acts with pandimensional authenticity, that is, with a demeanor of genuineness, trustworthiness, and knowledgeable caring. The nurse focuses on the client as a unified whole (a unitary human being) and participates in individualized nursing by looking at each client and determining the range of behaviors that are normal for him or her. The nurse always takes diversity among clients into account, for that diversity has distinct implications for what will be done and how it will be done. The nurse comes to know human energy field pattern and environmental energy field pattern through manifestations of that pattern in the form of the client's experiences, perceptions, and expressions. The nurse attends to expressions of experiences and perceptions in such forms as the client's verbal responses, responses to questionnaires, and personal ways of living and relating. The nurse collects such relevant pattern information as the client's sensations, thoughts, feelings, awareness, imagination, memory, introspective insights, intuitive apprehensions, recurring themes and issues that pervade the client's life, metaphors, visualizations, images, nutrition, work and play, exercise, substance use, sleep/wake cycles, safety, decelerated/accelerated field rhythms, space-time shifts, interpersonal networks, and professional health care access and use.
2. **Voluntary Mutual Patterning**—The continuous process whereby the nurse, with the client, patterns the environmental energy field to promote harmony related to the health events. The nurse facilitates the client's actualization of potentials for health and well-being. The nurse has no investment in the client's changing in a particular way. The nurse does not attempt to change anyone to conform to arbitrary health ideals. Rather, the nurse enhances the client's efforts to actualize health potentials from his or her point of view. The nurse helps to create an environment where healing conditions are optimal and invites the client to heal him- or herself as the nurse and the client participate in various health patterning modalities. The nurse uses many different modes of health patterning, including such noninvasive modalities as therapeutic touch; imagery; meditation; relaxation; balancing activity and rest; unconditional love; attitudes of hope, humor, and upbeat moods; the use of sound, color, and motion; health education; wellness counseling; nutrition counseling; meaningful presence; meaningful dialogue; affirmations (expressions of intentionality); bibliotherapy; journal keeping; esthetic experiences of art, poetry, and nature; collaborative advocacy; and computer-based virtual reality. The nurse recognizes

that both noninvasive modalities and technology are simply tools used to apply knowledge in practice.

3. **Pattern Manifestation Knowing—Evaluation**—The nurse evaluates voluntary mutual patterning by means of pattern manifestation knowing. The nurse monitors and collects additional pattern information as it unfolds during voluntary mutual patterning and considers the pattern information within the context of continually emerging health patterning goals affirmed by the client.

Implications for Nursing Education

Education for nursing practice requires a commitment to lifelong learning. Education for professional nursing occurs at the baccalaureate, masters, and doctoral levels in college and university settings. The purpose of professional nursing educational programs is to provide the knowledge and tools necessary for nursing practice. The liberal arts and sciences are a predominant component of the curriculum. The principles of resonancy, helicy, and integrality represent the major integrating concepts of the nursing courses.

CALLISTA ROY'S ADAPTATION MODEL

Overview

Focuses on the responses of the human adaptive system, which can be an individual or a group, to a constantly changing environment. Adaptation is the central feature of the model. Problems in adaptation arise when the adaptive system is unable to cope with or respond to constantly changing stimuli from the internal and external environments in a manner that maintains the integrity of the system. Environmental stimuli are categorized as:

1. **Focal**—the stimuli most immediately confronting the person.
2. **Contextual**—the contributing factors in the situation.
3. **Residual**—other unknown factors that may influence the situation. When the factors making up residual stimuli become known, they are considered focal or contextual stimuli.

Adaptation occurs through two types of innate or acquired coping mechanisms used to respond to changing environmental stimuli:

1. **Regulator coping subsystem**—for individuals; receives input from the external environment and from changes in the individual's internal state and processes the changes through neural-chemical-endocrine channels to produce responses.
2. **Cognator coping subsystem**—for individuals; also receives input from external and internal stimuli that involve psychological, social, physical, and physiological factors, including regulator subsystem outputs. These stimuli then are processed through cognitive/emotive pathways, including perceptual/information processing, learning, judgment, and emotion.
3. **Stabilizer subsystem control process**—for groups; involves the established structures, values, and daily activities used by a group to accomplish its primary purpose and contribute to common purposes of society.
4. **Innovator subsystem control process**—pertains to humans in groups; involves the structures and processes necessary for change and growth in human social systems.

Responses take place in four modes for individuals and groups:

1. **Physiological/physical mode**
   Physiological mode—for individuals; concerned with basic needs requisite to maintaining the physical and physiological integrity of the individual human system. It encompasses oxygenation; nutrition; elimination; activity and rest; protection; senses; fluid, electrolyte, and acid-base balance; neurologic function; and endocrine function. The basic underlying need is physiologic integrity.
   Physical mode—for groups; pertains to the manner in which the collective human adaptive system manifests adaptation relative to basic operating resources, that is, participants, physical facilities, and fiscal resources. The basic underlying need is resource adequacy, or wholeness achieved by adapting to change in physical resource needs.
2. **Self-concept/group identity mode**
   Self-concept mode—for the individual; addresses the composite of beliefs and feelings that a person holds about him- or herself at a given time. The basic underlying need is psychic and spiritual integrity, the need to know who one is so that one can be or exist with a sense of unity, meaning, and purposefulness in the universe. The Physical Self refers to the individual's appraisal of his or her own physical being, including physical attributes, functioning, sexuality, health and illness states, and appearance; includes the components of body sensation and body image. The Personal Self refers to the individual's appraisal of his or her own characteristics, expectations, values, and worth, including self-consistency, self-ideal, and the moral-ethical-spiritual self.
   Group identity mode—for groups; addresses shared relations, goals, and values, which create a social milieu and culture, a group self-image, and coresponsibility for goal achievement. Identity integrity is the underlying need, which implies the honesty, soundness, and completeness of the group members' identification with the group and involves the process of sharing identity and goals. This mode encompasses Interpersonal Relationships, Group Self-Image, Social Milieu, and Group Culture.
3. **Role function mode**—for the individual, focuses on the roles that the individual occupies in society. The basic underlying need is social integrity, the need to know who one is in relation to others so that one can act. For the group, focuses on the action components associated with group infrastructure that are designed to contribute to the accomplishment of the group's mission, or the tasks or functions associated with the group. The basic underlying need is role clarity, the need to understand and commit to fulfill expected tasks, so that the group can achieve common goals.
4. **Interdependence mode**—behavior pertaining to interdependent relationships of individuals and groups. The basic underlying need is relational integrity, the feeling of security in nurturing relationships. For the individual, focuses on interactions related to the giving and receiving of love, respect, and value, and encompasses Affectional Adequacy, Developmental Adequacy, Resource Adequacy, Significant Others, and Support Systems. For the group, pertains to the social context in which the group operates including both private and public contacts both within the group and with those outside the group, and encompasses Affectional Adequacy, Developmental Adequacy, Resource Adequacy, Context, Infrastructure, and Resources.

The four modes are interrelated. Responses in any one mode may have an effect on or act as a stimulus in one or all of the other modes. Responses in each mode are judged as either:

1. **Adaptive**—promote the goals of human adaptive system, including survival, growth, reproduction, and mastery.
2. **Ineffective**—those that do not contribute to the goals of the human adaptive system.

Implications for Nursing Practice

Nursing practice is directed toward promoting adaptation in each of the four response modes, thereby contributing to the person's health, quality of life, and dying with dignity. Roy's practice methodology is the Roy Adaptation Model Nursing Process, which encompasses six steps:

1. **Assessment of behavior**—The nurse systematically gathers data about the behavior of the human adaptive system and judges the current state of adaptation in each adaptive mode.

The nurse uses one or more of the Roy Adaptation Model–based research instruments or clinical tools to guide application and documentation of the practice methodology and systematically gathers data about observable and nonobservable behaviors for each aspect of the four adaptive modes, focusing on the individual or the group of interest. The nurse gathers behavioral data by means of observation, objective measurement, and purposeful interviews.

The nurse, in collaboration with the human adaptive system of interest, makes a tentative judgment about behaviors in each adaptive mode. Behaviors are tentatively judged as adaptive or ineffective responses, using the criteria of the human adaptive system's individualized goals and comparison of the behaviors with norms signifying adaptation. If norms are not available, the nurse considers adaptation difficulty as pronounced regulator activity with cognator ineffectiveness for individuals, or pronounced stabilizer activity with innovator ineffectiveness for groups. The nurse sets priorities for further assessment, taking the goals of adaptation into account.

The first priority is behaviors that threaten the survival of the individual, family, group, or community. The second priority is behaviors that affect the growth of the individual, family, group, or community. The third priority is behaviors that affect the continuation of the human race or of society. The fourth priority is behaviors that affect the attainment of full potential for the individual or group.

2. **Assessment of stimuli**—The nurse recognizes that stimuli must be amenable to independent nurse functions. Consequently, factors such as medical diagnoses and medical treatments are not considered stimuli because those factors cannot be independently managed by nurses.

   The nurse identifies the internal and external focal and contextual stimuli that are influencing the behaviors of particular interest. The nurse recognizes that residual stimuli typically are present and attempts to confirm the presence of those stimuli by asking the human adaptive system about other stimuli and/or by recourse to theoretical or experiential knowledge. When residual stimuli finally are identified, they are classified as contextual or focal stimuli. The nurse identifies the internal stimulus of the adaptation level, and determines whether it reflects integrated, compensatory, or compromised life processes.

   In situations where all behaviors are judged as adaptive responses, assessment of stimuli focuses on identifying potential threats to adaptation. The nurse identifies stimuli by means of observation, objective measurement, and purposeful interviews.

   The nurse validates perceptions and thoughts about relevant stimuli with the human adaptive system of interest, using Orlando's deliberative nursing process:

   The nurse shares perceptions and thoughts about relevant stimuli with the human adaptive system.

   The nurse asks if those are the relevant stimuli.

   The human adaptive system confirms or does not confirm the identified stimuli as relevant.

   If the stimuli are not confirmed as relevant, the nurse and the human adaptive system discuss their perceptions of the situation until agreement about relevant stimuli is reached.

3. **Nursing diagnosis**—The nurse uses a process of judgment to make a statement conveying the adaptation status of the human adaptive system of interest. The nursing diagnosis is a statement that identifies the behaviors of interest together with the most relevant influencing stimuli. The nurse uses one of three different approaches to state the nursing diagnosis:

   Behaviors are stated within each adaptive mode and with their most relevant influencing stimuli.

   A summary label for behaviors in each adaptive mode with relevant stimuli is used.

   A label that summarizes a behavioral pattern across adaptive modes that is affected by the same stimuli is used.

   The nurse may link the Roy Adaptation Model–based nursing diagnosis with a relevant diagnosis from the taxonomy of the North American Nursing Diagnosis Association (NANDA). The nurse assigns a priority to each nursing diagnosis—the first priority is behaviors that threaten the survival of the individual, family, group, or community; the second priority is behaviors that affect the growth of the individual, family, group, or community; the third priority is behaviors that affect the continuation of the human race or of society; the fourth priority is behaviors that affect the attainment of full potential for the individual or group.

4. **Goal setting**—The nurse articulates a clear statement of the behavioral outcomes in response to nursing provided to the human adaptive system. The nurse actively involves the human adaptive system in the formation of behavioral goals if possible.

The nurse states goals as specific short-term and long-term behavioral outcomes of nursing intervention. The goal statement designates the behavior of interest, the way in which the behavior will change, and the time frame for attainment of the goal. Goals may be stated for ineffective behaviors that are to be changed to adaptive behaviors and also for adaptive behaviors that should be maintained or enhanced.

5. **Nursing intervention**—The nurse selects and implements nursing approaches that have a high probability of changing stimuli or strengthening adaptive processes. Nursing intervention is the management of stimuli. The nurse manages the focal stimulus first if possible, and then manages the contextual stimuli. The nurse uses the McDonald and Harms nursing judgment method, in collaboration with the human adaptive system, to select a nursing intervention:
   - Alternative approaches to management of stimuli are listed, along with the consequences of management of each stimulus.
   - The probability (high, moderate, low) for each consequence is determined.
   - The value of the outcomes of each approach is designated as desirable or undesirable.

   The options are shared with the human adaptive system. The nursing intervention with the highest probability of reaching the valued goal is selected. The nurse determines and implements the steps that will manage the stimulus appropriately.
6. **Evaluation**—The nurse judges the effectiveness of nursing interventions in relation to the behaviors of the human adaptive system. The nurse systematically reassesses observable and nonobservable behaviors for each aspect of the four adaptive modes. The nurse gathers the behavioral data by means of observation, objective measurement, and purposeful interviews. The nurse uses the following criteria to judge the effectiveness of nursing intervention:
   - The goal was attained.
   - The human adaptive system manifests behavior stated in the goals.
   - The human adaptive system demonstrates a positive response to the stimuli that frees energy for responses to other stimuli.

   If the criteria for nursing intervention effectiveness are met, and if there is no threat that the behavior will become ineffective again, then that behavior may be deleted from nursing concern. If, however, the criteria are not met, the nurse must determine what went wrong. Possibilities are:
   - The goals were unrealistic or unacceptable to the human adaptive system.
   - The assessment data were inaccurate or incomplete.
   - The selected nursing intervention approaches were not implemented properly.

   The nurse then returns to Assessment of Behaviors to closely examine behaviors that continue to be ineffective and to try to further understand the situation. The end result of the Roy Adaptation Model Nursing Process is an update of the nursing care plan.

Implications for Nursing Education

The model is an appropriate curriculum guide for diploma, associate degree, baccalaureate degree, and master's degree nursing education programs. Curriculum content is based on the components of the conceptual model. The vertical strands of the curriculum focus on theory and practice. The theory strand encompasses content on the adapting person, health/illness, and stress/disruption. The practice strand emphasizes nursing management of environmental stimuli. The horizontal strands include the nursing process and student adaptation and leadership.

Appendix N2–3 Nursing Theories

A theory is defined as one or more relatively concrete and specific concepts that are derived from a conceptual model, the propositions that narrowly describe those concepts, and the propositions that state relatively concrete and specific relations between two or more of the concepts. Grand theories are rather broad in scope. They are made up of concepts and propositions that are less abstract and general than the concepts and propositions of a conceptual model but are not as concrete and specific as the concepts and propositions of a middle-range theory. Middle-range theories are narrower in scope

than grand theories. They are made up of a limited number of concepts and propositions that are written at a relatively concrete and specific level.

HELEN ERICKSON, EVELYN TOMLIN, AND MARY ANN SWAIN'S THEORY OF MODELING AND ROLE MODELING

Overview

A grand theory or paradigm for the practice of professional nursing that focuses on the processes by which the nurse seeks to understand the client's unique model of the world and by which the nurse understands that unique model within the context of scientific theories and plans nursing interventions that promote health. The two major concepts of the theory are:

1. **Modeling** —an act that represents the process the nurse uses to develop an image and understand the client's world from the client's perspective. Modeling encompasses the art and science of nursing. The art of modeling is the development of a mirror image of the situation from the client's perspective, which requires communication skills that help the nurse to enter into the foreign world of the client. The science of modeling is the scientific aggregation and analysis of data collected about the client's model of the world.
2. **Role Modeling** —occurs only after modeling has been accomplished. It involves the facilitation of the individual in attaining, maintaining, or promoting health through purposeful interventions, which are planned on the basis of the analysis and synthesis of data about the client's model of the world. Role modeling also encompasses the art and science of nursing. The art of role modeling occurs when the nurse plans and implements unique interventions with respect to a theoretical base for the practice of nursing. Role modeling is the essence of nurturance, the basis for the predictive and prescriptive component of nursing practice. It requires an unconditional acceptance of the client as the client is while gently encouraging and facilitating growth and development at the client's own pace and within the client's own model of the world.

Implications for Nursing Practice

The nursing process is an ongoing, interactive exchange of information, feelings, and behavior between nurses and clients. The nurse's goal is to nurture and support the client's self-care. Nursing practice is directed toward collection of data primarily from clients but also from families, nurses, and other health care providers. Data collection is organized into four categories:

1. **Description of the situation, including:** *Overview of the situation*—an overview of the client's situation from the client's perspective;
   Etiology—identification of relevant etiological factors, including stressors and destressors;
   Therapeutic needs—identification of possible therapeutic interventions
2. **Immediate and long-term expectations** —development of an understanding of the client's personal orientation regarding present and future expectations.
3. **Resource potential** —available internal and external resources.
   External—determination of the nature of the external support system, from the social network, support system, and health care system.
   Internal—determination of the client's strengths, virtues, and currently available internal resources, including adaptive potential, feeling states, and psychological status.
4. **Current and future goals and life tasks** —determination of the client's current developmental status, so as to understand his or her personal model and to use appropriate communication skills.

Data collection is followed by aggregation, analysis, and synthesis of the data. Nursing diagnoses are derived from the analysis and synthesis of the data. Nursing interventions that are acceptable within the client's model of the world are then developed. The goals of nursing intervention and their associated aims are:

1. **Goal:** Develop a trusting and functional nurse-client relationship. *Aim:* Build trust.
2. **Goal:** Facilitate a futuristic and positive self-projection. *Aim:* Promote the client's positive orientation.
3. **Goal:** Promote affiliated individuation with the minimum possible degree of ambivalence. *Aim:* Promote client's control.
4. **Goal:** Promote a dynamic, adaptive, and holistic health state. *Aim:* Affirm and promote the client's strengths.

5. **Goal:** Promote and nurture coping mechanisms that satisfy basic needs and permit growth-need satisfaction. *Aim:* Set mutual goals that are health-directed.

Implications for Nursing Education

Education of professional nursing practice requires consideration of seven factors that are required for implementation of the modeling and role modeling theory. These factors are:

Have confidence in nursing.
Establish a belief system.
Promote adherence.
Develop a language.
Give and get collegial support.
Be willing to take risks.
Believe in yourself.

MADELEINE LEININGER'S THEORY OF CULTURE CARE DIVERSITY AND UNIVERSALITY

Overview

A grand theory focusing on the discovery of human care diversities and universalities and ways to provide culturally congruent care to people. The concepts of the theory are:

1. **Care**—abstract and concrete phenomena related to assisting, supporting, or enabling experiences or behaviors toward or for others with evident or anticipated needs to ameliorate or improve a human condition or lifeway.
2. **Caring**—the actions and activities directed toward assisting, supporting, or enabling another individual or group with evident or anticipated needs to ameliorate or improve a human condition or lifeway or to face death.
3. **Culture**—the learned, shared, and transmitted values, beliefs, norms, and lifeways of a particular group that guide thinking, decisions, and actions in patterned ways; encompasses several cultural and social structure dimensions: technological factors, religious and philosophical factors, kinship and social factors, political and legal factors, economic factors, educational factors, and cultural values and lifeways.
4. **Language**—word usages, symbols, and meanings about care.
5. **Ethnohistory**—past facts, events, instances, experiences of individuals, groups, cultures, and institutions that are primarily people centered (ethno) and which describe, explain, and interpret human lifeways within particular cultural contexts and over short or long periods of time.
6. **Environmental context**—the totality of an event, situation, or particular experiences that give meaning to human expressions, interpretations, and social interactions in particular physical, ecological, sociopolitical, and/or cultural settings.
7. **Health**—a state of well-being that is culturally defined, valued, and practiced, and which reflects the ability of individuals (or groups) to perform their daily role activities in culturally expressed, beneficial, and patterned lifeways.
8. **Worldview**—the way people tend to look out on the world or their universe to form a picture of or a value stance about their life or the world around them.
9. **Cultural care**—the subjectively and objectively transmitted values, beliefs, and patterned lifeways that assist, support, or enable another individual or group to maintain well-being and health, to improve his or her human condition and lifeway, to deal with illness, handicaps, or death. The two dimensions are:
   - *Cultural care diversity*— the variabilities and/or differences in meanings, patterns, values, lifeways, or symbols of care within or between collectivities that are related to assistive, supportive, or enabling human care expressions.
   - *Cultural care universality*— the common, similar, or dominant uniform care meanings, patterns, values, lifeways, or symbols that are manifest among many cultures and reflect assistive, supportive, facilitative, or enabling ways to help people.
10. **Care systems**—the values, norms, and structural features of an organization designed for serving people's health needs, concerns, or conditions. The two types of care systems are:

Generic lay care system— traditional or local indigenous health care or cure practices that have special meanings and uses to heal or assist people, which are generally offered in familiar home or community environmental contexts with their local practitioners.
Professional health care system— professional care or cure services offered by diverse health personnel who have been prepared through formal professional programs of study in special educational institutions.

11. **Cultural-congruent nursing care**—cognitively based assistive, supportive, facilitative, or enabling acts or decisions that are tailored to fit with individual, group, or institutional cultural values, beliefs, and lifeways in order to provide or support meaningful, beneficial, and satisfying health care or well-being services. The three modes of cultural-congruent nursing care are:
    Cultural care preservation or maintenance— assistive, supportive, facilitative, or enabling professional actions and decisions that help people of a particular culture to retain and/or preserve relevant care values so that they can maintain their well-being, recover from illness, or face handicaps and/or death.
    Cultural care accommodation or negotiation— assistive, supportive, facilitative, or enabling creative professional actions and decisions that help people of a designated culture to adapt to, or to negotiate with, others for a beneficial or satisfying health outcome with professional care providers.
    Cultural care repatterning or restructuring— assistive, supportive, facilitative, or enabling professional actions and decisions that help clients reorder, change, or greatly modify their lifeways for a new, different, and beneficial health care pattern while respecting the clients' cultural values and beliefs and still providing a beneficial or healthier lifeway than before the changes were coestablished with the clients.

Implications for Nursing Practice

Nursing practice is directed toward improving and providing culturally congruent care to people. A practice methodology for the Theory of Culture Care Diversity and Universality is as follows:

Goals of Nursing Practice are: to improve and to provide culturally congruent care to people that is beneficial, will fit with, and be useful to the client, family, or culture group healthy lifeways; to provide culturally congruent nursing care in order to improve or offer a different kind of nursing care service to people of diverse or similar cultures.

Clients include individuals, families, subcultures, groups, communities, and institutions.

Culturalogical Assessment The nurse maintains a holistic or total view of the client's world by using the Sunrise Model and Enablers to guide assessment of cultural beliefs, values, and lifeways.

The nurse is aware that the client may belong to a subculture or special group that maintains its own values and beliefs that differ from the values and beliefs of the dominant culture. The nurse shows a genuine interest in the client and learns from and maintains respect for the client. The nurse asks open-ended questions and maintains the role of an active listener, learner, and reflector. The nurse shares professional knowledge only if the client asks about such knowledge.

The nurse begins the assessment with such questions as: What would you like to share with me today about your experiences or beliefs, to help you keep well? Are there some special ideas or ways you would like nurses to care for you? The nurse gives attention to clients' gender differences, communication modes, special language terms, interpersonal relationships, and use of space and foods.

Nursing Judgments, Decisions, and Actions Nursing practice requires the coparticipation of nurses and clients working together to identify, plan, implement, and evaluate the appropriate mode(s) of cultural-congruent nursing care. Nursing decisions and actions encompass: Assisting, Supporting, Facilitating, and Enabling. Nurse and client select one or more mode of cultural-congruent nursing care:

Cultural Care Preservation or Maintenance— used when professional decisions and actions are needed to help clients of a designated culture to retain and/or preserve relevant care values so that they can maintain their well-being, recover from illness, or face handicaps and/or death.
Cultural Care Accommodation or Negotiation— used when professional actions and decisions are needed to help clients of a designated culture to adapt to, or to negotiate with, others for a beneficial or satisfying health outcome with professional care providers.

Cultural Care Repatterning or Restructuring— used when professional actions and decisions are needed to help clients of a designated culture to reorder, change, or greatly modify their lifeways for a new, different, and beneficial health care pattern while respecting the clients' cultural values and beliefs and still providing a beneficial or healthier lifeway than before the changes were coestablished with the clients.

Clinical Protocols Specific nursing practices or clinical protocols are derived from the findings of research guided by the Theory of Culture Care Diversity and Universality. The research findings are used to develop protocols for cultural-congruent care that blends with the particular cultural values, beliefs, and lifeways of the client, and is assessed to be beneficial, satisfying, and meaningful to the client.

Implications for Nursing Education

Professional nursing care, learned in formal educational programs, builds upon the generic care given by naturalistic lay and folk care givers. The curriculum emphasizes transcultural nursing knowledge, with formal study about different cultures in the world, as well as culture-universal and culture-specific health care needs of people and nursing care practices. Transcultural nurse generalists are prepared at the baccalaureate level for the general use of transcultural nursing concepts, principles, and practices. Transcultural nurse specialists, who are prepared at the doctoral level, have in-depth understanding of a few cultures and can function as field practitioners, teachers, researchers, or consultants. Certification is awarded by the Transcultural Nursing Society to nurses who have educational preparation in transcultural nursing or the equivalent and who demonstrate basic clinical competence in transcultural nursing.

MARGARET NEWMAN'S THEORY OF HEALTH AS EXPANDING CONSCIOUSNESS

Overview

A grand theory focusing on health as the expansion of consciousness, with emphasis on the idea that every person in every situation, no matter how disordered and hopeless the situation may seem, is part of the universal process of expanding consciousness. The concepts of the theory are:

1. **Consciousness**—the informational capacity of human beings, that is, the ability of humans to interact with their environments. Consciousness encompasses interconnected cognitive and affective awareness, physiochemical maintenance including the nervous and endocrine systems, growth processes, the immune system, and the genetic code. Consciousness can be seen in the quantity and quality of the interaction between human beings and their environments. The process of life is toward higher levels of consciousness; sometimes this process is smooth, pleasant, harmonious; other times it is difficult and disharmonious, as in disease.
2. **Pattern**—a fundamental attribute of all there is and reveals unity in diversity; information that depicts the whole, understanding of the meaning of all the relationships at once; relatedness; self-organizing over time, such that it becomes more highly organized with more information. Pattern identifies particular people and is an identification of the wholeness of the person. Pattern is manifested as exchanging (interchanging matter and energy between person and environment and transforming energy from one form to another); communicating (interchanging information from one system to another); relating (connecting with other persons and the environment); valuing (assigning worth); choosing (selecting of one or more alternatives); moving (rhythmic alternating between activity and rest); perceiving (receiving and interpreting information); feeling (sensing physical and intuitive awareness); and knowing (personal recognition of self and world). Pattern encompasses three dimensions—Movement-Space-Time, Rhythm, and Diversity.
3. **Movement-Space-Time**—movement is the natural condition of life, an essential property of matter and a means of communicating; when movement ceases, it is an indication that life has gone out of the organism. Movement is the means whereby one perceives reality and becomes aware of self. Movement is a means whereby space and time become a reality. Time is a function of movement. Time and space have a complementary relationship.

Movement—an essential property of matter; a means of communicating; the means whereby one perceives reality and becomes aware of self; the natural condition of life.
Space—encompasses personal space, inner space, and life space as dimensions of space relevant to the individual, and territoriality, shared space, and distancing as dimensions relevant to the family.
Time—the amount of time perceived to be passing (subjective time); clock time (objective time).
Rhythm—basic to movement; the rhythm of movement is an integrating experience.
Diversity—seen in the parts.

Implications for Nursing Practice

Nursing practice is directed toward facilitating pattern recognition by connecting with the client in an authentic way, and assisting the client to discover new rules for a higher level of organization or consciousness. Newman's Research as Praxis Protocol is a research/practice methodology. The phenomenon of interest is the process of expanding consciousness.

The Interview The meeting of the nurse and the study participant/client occurs when there is a mutual attraction via congruent patterns, i.e., interpenetration of the two fields. The nurse and study participant/client enter into a partnership, with the mutual goal of participating in an authentic relationship, trusting that in the process of its unfolding, both will emerge at a higher level of consciousness.

Development of the Narrative: Pattern Recognition The nurse selects the statements deemed most important to the study participant/client and arranges the key segments of the data in chronological order to highlight the most significant events and persons. The data remain the same except in the order of presentation. Natural breaks where a pattern shift occurs are noted and form the basis of the sequential patterns. Recognition of the pattern of the whole, made up of segments of the study participant/client's relationships over time, will emerge for the nurse. The nurse then transmutes the narrative into a simple diagram of the sequential pattern configurations.

Follow-Up: Pattern Recognition The nurse conducts a second interview with the study participant/client to share the diagram or other visual portrayal of the pattern. The nurse does not interpret the diagram. Rather, it is used simply to illustrate the study participant/ client's story in graphic form, which tends to accentuate the contrasts and repetitions in relationships over time. The mutual viewing of the graphic form is an opportunity for the study participant/client to confirm and clarify or revise the story being portrayed. The mutual viewing also is an opportunity for the nurse to clarify any aspect of the story about which he or she has any doubt.

The nature of the pattern of person-environment interaction will begin to emerge in terms of energy flow (e.g., blocked, diffuse, disorganized, repetitive, or whatever descriptors and metaphors come to mind to describe the pattern). The study participant/client may express signs that pattern recognition is occurring (or already has occurred in the interval following the first interview) as the nurse and study participant/client reflect together on the study participant/client's life pattern. If no signs of pattern recognition occur, the nurse and study participant/client may want to proceed with additional reflections in subsequent interviews until no further insight is reached. Sometimes, no signs of pattern recognition emerge, and if so, that characterizes the pattern for that person. It is not to be forced.

Application of Theory of Health as Expanding Conciousness The nurse undertakes more intense analysis of the data in light of the Theory of Health as Expanding Consciousness after the interviews are completed. The nurse evaluates the nature of the sequential patterns of interaction in terms of quality and complexity and interprets the patterns according to the study participant/client's position on Young's spectrum of consciousness. The sequential patterns represent presentational construing or relationships. Any similarities of pattern among a group of study participants/ clients having a similar experience may be designated by themes and stated in propositional form.

Implications for Nursing Education

Education for nursing should be the professional doctoral degree, the Doctor of Nursing (ND), which requires a strong arts and sciences background as pre-professional education. Students and practicing nurses who plan to use the Theory of Health as Expanding Consciousness have to be prepared for personal transformation in the way that they view the world and nursing.

IDA JEAN ORLANDO'S THEORY OF THE DELIBERATIVE NURSING PROCESS

Overview

A middle-range predictive theory focusing on an interpersonal process that is directed toward facilitating identification of the nature of the patient's distress and his or her immediate needs for help. The concepts of the theory are:

1. **Patient's behavior**—behavior observed by the nurse in an immediate nurse-patient situation. The two dimensions are:
   Need for help— a requirement of the patient that, if supplied, relieves or diminishes immediate distress or improves immediate sense of adequacy or well-being.
   Improvement— an increase in patients' mental and physical health, their well-being, and their sense of adequacy. The need for help and improvement can be expressed in both nonverbal and verbal forms. Visual manifestations of nonverbal behavior include such motor activities as eating, walking, twitching, and trembling, as well as such physiological forms as urinating, defecating, temperature and blood pressure readings, respiratory rate, and skin color. Vocal forms of nonverbal behavior—nonverbal behavior that is heard—include crying, moaning, laughing, coughing, sneezing, sighing, yelling, screaming, groaning, and singing. Verbal behavior refers to what a patient says, including complaints, requests, questions, refusals, demands, and comments or statements.
2. **Nurse's reaction**—the nurse's nonobservable response to the patient's behavior. The three dimensions are:
   Perception— physical stimulation of any one of the five senses by the patient's behavior.
   Thought— an idea that occurs in the nurse's mind.
   Feeling— a state of mind inclining the nurse toward or against a perception, thought, or action; occurs in response to the nurse's perceptions and thoughts.
3. **Nurse's activity**—the observable actions taken by nurses in response to their reactions, including instructions, suggestions, directions, explanations, information, requests, and questions directed toward the patient; making decisions for the patient; handling the patient's body; administering medications or treatments; and changing the patient's immediate environment. The two dimensions of nurse's activity are:
   Automatic nursing process— actions decided on by the nurse for reasons other than the patient's immediate need.
   Deliberative nursing process (process discipline)—a specific set of nurse behaviors or actions directed toward the patient's behavior that ascertain or meet the patient's immediate needs for help.

Implications for Nursing Practice

Nursing practice is directed toward identifying and meeting the patient's immediate needs for help through use of Orlando's Practice Methodology.

1. **Observations** encompass any and all information pertaining to a patient that the nurse acquires while on duty.
2. **Direct Observations** are the nurse's reaction to the patient's behavior. Direct observations are any perception, thought, or feeling the nurse has from his or her own experience of the patient's behavior at any or several moments in time.
3. **Indirect Observations** consist of any information that is derived from a source other than the patient. This information pertains to, but is not directly derived from, the patient.
4. **Actions** are carried out with or for the patient.
5. **Nurse's Activity: Deliberative Nursing Process** The process used to share and validate the nurse's direct and indirect observations is the Deliberative Nursing Process. Clinical protocols contain the specific requirements for the Deliberative Nursing Process. The nurse may express and explore any aspect of his or her reaction to the patient's behavior—perception, thought, or feeling. If exploration of one aspect of the nurse's reaction does not result in identification of the patient's need for help, then another aspect of the reaction can be explored. If exploration of all aspects of the

nurse's reaction does not yield a verbal response from the patient, then the nurse may use negative expressions to demonstrate continued interest in the patient's behavior and to give the patient permission to respond with his or her own negative reaction. Examples of negative expressions by the nurse are: Is it that you don't think I'll understand? Am I wrong? It looked like that procedure was very painful, and you didn't say a word about it.

6. **Direct Help** The nurse meets the patient's need directly when the patient is unable to meet his or her own need and when the activity is confined to the nurse-patient contact.
7. **Indirect Help** The nurse meets the patient's need indirectly when the activity extends to arranging the services of a person, agency, or resource that the patient cannot contact by himself or herself.
8. **Reporting** The nurse receives reports about the patient's behavior from other nurses, and from other health professionals. The nurse reports his or her observations of the patient's behavior to other nurses and other health professionals.
9. **Recording** The nurse records the nursing process, including: the nurse's perception of or about the patient; the nurse's thought and/or feeling about the perception; what the nurse said and/or did to, with, or for the patient.

Implications for Nursing Education

Students should be trained in the use of the deliberative nursing process for all person-to-person contacts. The purpose of training is to change the nurse's activity from personal and automatic to disciplined and professional. Training is facilitated by use of process recordings that include perceptions of or about the patient, thoughts and/or feelings about the perception, and what was said and/or done to, with, or for the patient. The process discipline can be successfully taught in 6 to 12 weeks.

ROSEMARIE PARSE'S THEORY OF HUMAN BECOMING

Overview

A grand theory focusing on human experiences of participation with the universe in the cocreation of health. The concepts of the theory are:

1. **Human becoming**—a unitary construct referring to the human being's living health.
2. **Meaning**—the linguistic and imagined content of something and the interpretation that one gives to something.
3. **Rhythmicity**—the cadent, paradoxical patterning of the human-universe mutual process.
4. **Transcendence**—reaching beyond with possibles—the hopes and dreams envisioned in multidimensional experiences [and] powering the originating of transforming.
5. **Imaging**—reflective/prereflective coming to know the explicit/tacit all-at-once.
6. **Valuing**—confirming/not confirming cherished beliefs in light of a personal world view.
7. **Languaging**—signifying valued images through speaking/being silent and moving/being still.
8. **Revealing/Concealing**—disclosing/not disclosing all-at-once.
9. **Enabling/Limiting**—living the opportunities/restrictions present in all choosings all-at-once.
10. **Connecting/Separating**—being with and apart from others, ideas, objects, and situations all-at-once.
11. **Powering**—the pushing/resisting process of affirming/not affirming being in light of nonbeing.
12. **Originating**—inventing new ways of conforming/nonconforming in the certainty/uncertainty of living.
13. **Transforming**—shifting the view of the familiar/unfamiliar, the changing of change in coconstituting anew in a deliberate way.

The three major principles of the theory of human becoming are:

1. **Structuring meaning multidimensionally is cocreating reality through the languaging of valuing and imaging**—means that humans construct what is real for them from choices made at many realms of the universe.
2. **Cocreating rhythmical patterns of relating is living the paradoxical unity of revealing-concealing and enabling-limiting while connecting-separating**—means that humans live in rhythm with the universe coconstituting patterns of relating.
3. **Cotranscending with the possibles is powering unique ways of originating in the process of transforming**—means that humans forge unique paths with shifting perspectives as a different light is cast on the familiar.

Implications for Nursing Practice

Nursing practice is directed toward respecting the quality of life as perceived by the person and the family. The practice methodology is as follows:

Principle 1: Structuring meaning multidimensionally. *Illuminating Meaning:* explicating what was, is, and will be. *Explicating:* making clear what is appearing now through languaging.

Principle 2: Cocreating rhythmical patterns. *Synchronizing rhythms:* dwelling with the pitch, yaw, and roll of the human-universe process. *Dwelling with:* immersing with the flow of connecting/separating.

Principle 3: *Mobilizing transcendence:* moving beyond the meaning moment with what is not-yet. *Moving beyond:* propelling with envisioned possibles of transforming.

Contexts of nursing Nurse-person situations and nurse-group situations. Participants include children and adults. Locations include homes, shelters, health care centers, parish halls, all departments of hospitals and clinics, rehabilitation centers, offices, and other milieus where nurses are with people.

Goal of discipline of nursing is quality of life from the person's, family's, and community's perspective.

Goal of the human becoming nurse is to be truly present with people as they enhance their quality of lives.

True presence is a special way of "being with" in which the nurse is attentive to moment-to-moment changes in meaning as she or he bears witness to the person's or group's own living of value priorities.

Coming-to-be Present is an all-at-once gentling down and lifting up. True presence begins in the coming-to-be-present moments of preparation and attention. Preparation involves: an emptying to be available to bear witness to the other or others; being flexible, not fixed but gracefully present from one's center; dwelling with the universe at the moment, considering the attentive presence about to be. Attention involves focusing on the moment at hand for immersion.

Face-to-face discussions Nurse and person engage in dialogue. Conversation may be through discussion in general or through interpretations of stories, films, drawings, photographs, music, metaphors, poetry, rhythmic movements, and other expressions.

Silent immersion A process of the quiet that does not refrain from sending and receiving messages. A chosen way of becoming in the human-universe process lived in the rhythm of speaking–being silent, moving–being still as valued images incarnate meaning. True presence without words.

Lingering presence Recalling a moment through a lingering presence that arises after an immediate engagement. A reflective-prereflective "abiding with" attended to through glimpses of the other person, idea, object, or situation.

Ways of Changing Health Patterns in True Presence Creative Imagining Picturing, by seeing, hearing, and feeling, what a situation might be like if lived in a different way.

Affirming Personal Becoming Uncovering preferred personal health patterns by critically thinking about how or who one is.

Glimpsing the paradoxical Changing one's view of a situation by recognizing incongruities in that situation.

Implications for Nursing Education

Course content flows from the three principles of the theory. Clinical courses emphasize the knowledge and skills requisite to the application of the practice methodology. Graduate education builds on baccalaureate education and prepares specialists who concentrate on creating and testing concepts of the theory of human becoming.

NOLA PENDER'S HEALTH PROMOTION MODEL

Overview

A middle-range theory focusing on the relation of individual characteristics and experiences, behavior-specific cognitions and affect, commitment to a plan of action, and competing demands and preferences as to health-promoting behavior. The concepts of the theory are as follows:

1. **Individual characteristics and experiences** —prior related behavior and inherited and acquired characteristics that influence beliefs, affect, and performance of health-promoting behavior.
   - *Prior related behavior*—a behavior, enacted in the past, that is the same as or similar to the health-promoting behavior of interest.
   - *Personal factors*—inherited and acquired biological, psychological, and sociocultural characteristics.
   - *Personal biological factors*—encompass characteristics such as age, gender, body mass index, pubertal status, menopausal status, aerobic capacity, strength, agility, and balance.
   - *Personal psychological factors*—encompass characteristics such as self-esteem, self-motivation, personal competence, perceived health status, and definition of health.
   - *Personal sociocultural factors*—encompass characteristics such as race, ethnicity, acculturation, education, and socioeconomic status.
2. **Behavior-specific cognitions and affect** —factors that act as motivators for commitment to a plan of action and performance of health-promoting behavior and that are modifiable through nursing actions.
   - *Perceived benefits of action* —perception of anticipated positive outcomes that will occur as a result of performing a health-promoting behavior. There is a positive relation between perceived benefits of action and commitment to a plan of action.
   - *Perceived barriers to action*—perception of anticipated, imagined, or real blocks and personal costs of performing a health-promoting behavior; a constraint on commitment to a plan of action.
   - *Perceived self-efficacy*—perception of personal capability to organize and execute a health-promoting behavior; the higher the perceived self-efficacy, the lower the perceived barriers to action and the higher the likelihood of commitment to a plan of action and actual performance of a health-promoting behavior.
   - *Activity-related affect*—subjective positive or negative feelings that occur before, during, or following performance of a health-promoting behavior. There is a reciprocal positive relation between affect toward a behavior and perceived self-efficacy, such that the more positive the affect, the greater the perceived self-efficacy and vice versa. There is a positive relation between Iaffect toward a behavior and commitment to a plan of action and performance of a health-promoting behavior.
   - *Interpersonal influences*—cognitions about the behaviors, beliefs, or attitudes of significant others, including family, peers, and health care providers. Commitment to a plan of action and performance of health-promoting behavior is more like to occur when significant others model the behavior, expect the behavior to occur, and provide assistance and support to enable the behavior. The cognitions include:
     Norms that reflect expectations of significant others;
     Social support, including instrumental and emotional encouragement;
     Modeling, which refers to vicarious learning through observing others who are performing a health-promoting behavior.
   - *Situational influences*—personal perceptions and cognitions of a particular external environmental situation that can facilitate or impede performance of

health-promoting behavior, including perceptions of options available, demand characteristics, and aesthetic environmental features.

3. **Commitment to a plan of action** —intention to perform a health-promoting behavior and identification of a planned strategy that leads to performance of the behavior. There is a positive relation between commitment to a plan of action and maintenance of performance of a health-promoting behavior over time.
4. **Immediate competing demands and preferences** —competing demands are alternative behaviors over which individuals have low control due to environmental contingencies, such as work or family care responsibilities; competing preferences are alternative behaviors over which individuals exert relatively high control, such as choice of a particular food for a snack or meal. Commitment to a plan of action is less likely to result in the desired health-promoting behavior when competing demands require immediate attention or when competing preferences are more attractive.
5. **Health-promoting behavior** —action outcome directed toward attaining positive health outcomes.

Implications for Nursing Practice

Nursing practice is directed toward modification of cognitions, affect, and the interpersonal and physical environment to create incentives for health actions for people of all ages.

Implications for Nursing Education

Education for nursing practice focuses on promotion of health and prevention of illness and disease prevention. Health education strategies are emphasized.

HILDEGARD PEPLAU'S THEORY OF INTERPERSONAL RELATIONS

Overview

A middle-range descriptive theory focusing on the phases of the interpersonal process that occurs when an ill person and a nurse come together to resolve a difficulty felt in relation to health. The one concept of the theory is nurse-patient relationship, which is an interpersonal process made up of four components—two persons, the professional expertise of the nurse, and the client's problem or need for which expert nursing services are sought, and which has three discernible phases; one phase has two subphases:

1. **Orientation**—the phase in which the nurse first identifies himself or herself by name and professional status and states the purpose, nature, and time available for the patient; the phase during which the nurse conveys professional interest and receptivity to the patient, begins to know the patient as a person, obtains essential information about the patient's health condition, and sets the tone for further interactions.
2. **Working**—the phase in which the major course occurs. The two subphases are:
   Identification—the subphase during which the patient learns how to make use of the nurse-patient relationship.
   Exploitation—the subphase during which the patient makes full use of available professional services.
3. **Termination**—the phase in which the work accomplished is summarized and closure occurs.

Implications for Nursing Practice

Nursing practice is directed toward promoting favorable changes in patients, which is accomplished through the nurse-patient relationship. Within that relationship, the nurse's major function is to study the interpersonal relations between the patient/client and others. Peplau's clinical methodology, which can be used for both nursing practice and nursing research, is as follows:

Observation—Purpose is the identification, clarification, and verification of impressions about the interactive drama, of the pushes and pulls in the relationship between nurse and patient, as they occur.

Participant observation—Nurse's Behavior includes observation of the nurse's words, voice tones, body language, and other gestural messages. Patient's Behavior includes observation of the patient's words, voice tones, body language, and other gestural messages.

Interpersonal phenomena include observation of what goes on between the patient and the nurse.

Reframing empathic linkages occurs when the nurse's and/or the patient's ability to feel in self the emotions experienced by the other person in the same situation is converted to verbal communications by the nurse asking: What are you feeling right now?

Communication aims are the selection of symbols or concepts that convey both the reference, or meaning in the mind of the individual, and referent, the object or actions symbolized in the concept; and the wish to struggle toward the development of common understanding for words between two or more people.

Interpersonal techniques are verbal interventions used by nurses during nurse-patient relationships aimed at accomplishing problem resolution and competence development in patients.

Recording is the written record of the communication between nurse and patient, that is, the data collected through participant observation and reframing of empathic linkages. The aim is to capture the exact wording of the interaction between the nurse and the patient.

Data analysis focuses on testing the nurse's hypotheses, which are formulated from first impressions or hunches about the patient.

Phases of the nurse-patient relationship: Identify the phase of nurse-patient relationship in which communication occurred: orientation phase; working phase; identification subphase; exploitation subphase; termination phase.

Roles: Identify the roles taken by the nurse and the patient in each phase of the nurse-patient relationship.

Relations: Identify the connections, linkages, ties, and bonds that go on or went on between a patient and others, including family, friends, staff, or the nurse. Analyze the relations to identify their nature, origin, function, and mode.

Pattern integrations: Identify the patterns of the interpersonal relation between two or more people which together link or bind them and which enable the people to transform energy into patterns of action that bring satisfaction or security in the face of a recurring problem. Determine the type of pattern integration: complementary—the behavior of one person fits with and thereby complements the behavior of the other person; mutual—the same or similar behaviors are used by both persons; alternating—different behaviors used by two persons alternate between the two persons; antagonistic—the behaviors of the two persons do not fit but the relationship continues.

Implications for Nursing Education

Nursing is an educative instrument, a maturing force, that aims to promote forward movement of personality in the direction of creative, constructive, productive, personal, and community living. The task of each school of nursing is the fullest development of the nurse as a person who is aware of how he or she functions in a situation and as a person who wants to nurse patients in a helpful way.

REVA RUBIN'S THEORY OF CLINICAL NURSING

Overview

A grand theory focusing on patients as persons undergoing subjectively involved experiences of varying degrees of tension or stress in a health problem situation. The major concepts are the situation of the patient and nursing care. Statements related to the patient situation and nursing care are:

1. Nursing care is dependent on the best estimate available of the situation of the patient.

2. Nursing care exists in a one-to-one relationship with the patient.
3. The relationship of nursing care to the situation of the patient is an ever-changing process of interaction.
4. The situation of the patient is expressed as a fraction or ratio that reflects the level or intensity of nursing care required.
   If the situation for the patient is relatively insignificant, one that the patient can cope with quite well, then nursing care probably need not go beyond careful assessment.
   If the situation for the patient is overwhelming, nursing care may have to encompass a whole series of activities to reduce the effects of the situation or reinforce the capacities of the patient in coping with the situation.
5. Situations within the sphere of proper nursing concern are fluid.

Implications for Nursing Practice

Nursing practice is directed toward helping the patient adjust to, endure through, and usefully integrate the health problem situation in its many ramifications through the phenomenon of *situational fluidity,* which characterizes nursing care in terms of:

1. **Time**—nursing operates within the immediate present; patient needs and behavior have an immediacy if not an urgency.
2. **Definition or diagnostic sets**—nursing diagnoses are based on the definition of capacities and limitations of the persons who are patients in relation to the situations in which they find themselves.
3. **Actions**—nursing actions are primarily directed toward helping the patient realign observations and expectations into a better "fit" with each other; nursing conveys a message to patients about themselves in their immediate situations.

Implications for Nursing Education

Education for nursing practice and nursing research emphasizes learning the naturalistic method of observation of patients in action, involved in a natural situation and setting. The learners typically are graduate students in nursing. The nurse-observer is viewed as an identifiable and functional part of the setting, as well as a helpful adjunct in the situation. The student is trained to observe while providing nursing care for the patient in a particular situation and to then record the entire nurse-patient interaction. The recorded observation serves as a database for evaluation of the quality and adequacy of nursing care as well as for generation of new theories.

JEAN WATSON'S THEORY OF HUMAN CARING

Overview

A middle-range explanatory theory focusing on the human component of caring and the moment-to-moment encounters between the one who is caring and the one who is being cared for, especially the caring activities performed by nurses as they interact with others. The concepts of the theory are:

1. **Transpersonal caring relationship**—human-to-human connectedness, whereby each person is touched by the human center of the other; a special kind of relationship involving a high regard for the whole person and his or her being-in-the world. The concept transpersonal caring relationship encompasses three dimensions:
   Self— transpersonal-mindbodyspirit oneness, an embodied self, and an embodied spirit.
   Phenomenal field— the totality of human experience, one's being-in-the-world.
   Intersubjectivity— refers to an intersubjective human-to-human relationship in which the person of the nurse affects and is affected by the person of the other, both of whom are fully present in the moment and feel a union with the other.
2. **Caring occasion/caring moment**—The coming together of nurse and other(s), which involves action and choice both by the nurse and the other. The moment of coming together in a caring occasion presents them with the opportunity to decide how to be in the relationship—what to do with the moment.
3. **Caring (healing) consciousness**—A holographic dynamic that is manifest within a field of consciousness, and which exists through time and space and is dominant over physical illness.

4. **Carative factors**—those aspects of nursing that actually potentiate therapeutic healing processes for both the one caring and the one being cared for. The 10 carative factors are:
   - Forming a humanistic/altruistic system of values
   - Enabling and sustaining faith/hope
   - Being sensitive to self and others
   - Developing a helping/trusting, caring relationship
   - Promoting and accepting the expression of positive and negative feelings and emotions
   - Engaging in creative, individualized problem-solving caring processes
   - Promoting transpersonal teaching/learning
   - Attending to supportive, protective, and/or corrective mental, physical, societal, and spiritual environments
   - Assisting with gratification of basic human needs while preserving human dignity and wholeness
   - Allowing for, and being open to, existential/phenomenological/spiritual dimensions of caring and healing that cannot be fully explained scientifically through modern Western medicine

Implications for Nursing Practice

Nursing practice is directed toward helping persons gain a higher degree of harmony within the mind, body, and soul, which generates self-knowledge, self-reverence, self-healing, and self-care processes while increasing diversity, which is pursued through use of the 10 carative factors.

Implications for Nursing Education

Professional nursing education should be at the postbaccalaureate level of the Doctorate of Nursing (N.D.). The nature of human life is the subject matter of nursing. The curriculum acknowledges caring as a moral ideal and incorporates philosophical theories of human caring, health, and healing. Core areas of content are the humanities, social-biomedical science, and human caring content and process. Courses should use art, music, literature, poetry, drama, and movement to facilitate understanding of responses to health and illness as well as to new caring-healing modalities.

APPENDIX N3

Nursing Interventions Classification System

Intervention Labels and Definitions

Abuse Protection Support—Identification of high-risk dependent relationships and actions to prevent further infliction of physical or emotional harm

Abuse Protection Support: Child—Identification of high-risk, dependent child relationships and actions to prevent possible or further infliction of physical, sexual, or emotional harm or neglect of basic necessities of life

Abuse Protection Support: Domestic Partner—Identification of high-risk, dependent domestic relationships and actions to prevent possible or further infliction of physical, sexual, or emotional harm or exploitation of a domestic partner

Abuse Protection Support: Elder—Identification of high-risk, dependent elder relationships and actions to prevent possible or further infliction of physical, sexual, or emotional harm; neglect of basic necessities of life; or exploitation

Abuse Protection Support: Religious—Identification of high-risk, controlling religious relationships and actions to prevent infliction of physical, sexual, or emotional harm and/or exploitation

Acid-Base Management—Promotion of acid-base balance and prevention of complications resulting from acid-base imbalance

Acid-Base Management: Metabolic Acidosis—Promotion of acid-base balance and prevention of complications resulting from serum HCO_3 levels lower than desired

Acid-Base Management: Metabolic Alkalosis—Promotion of acid-base balance and prevention of complications resulting from serum HCO_3 levels higher than desired

Acid-Base Management: Respiratory Acidosis—Promotion of acid-base balance and prevention of complications resulting from serum PCO_2 levels higher than desired

Acid-Base Management: Respiratory Alkalosis—Promotion of acid-base balance and prevention of complications resulting from serum PCO_2 levels lower than desired

Acid-Base Monitoring—Collection and analysis of patient data to regulate acid-base balance

Active Listening—Attending closely to and attaching significance to a patient's verbal and nonverbal messages

Activity Therapy—Prescription of and assistance with specific physical, cognitive, social, and spiritual activities to increase the range, frequency, or duration of an individual's (or group's) activity

Acupressure—Application of firm, sustained pressure to special points on the body to decrease pain, produce relaxation, and prevent or reduce nausea

Admission Care—Facilitating entry of a patient into a health care facility

Airway Insertion and Stabilization—Insertion or assisting with insertion and stabilization of an artificial airway

Airway Management—Facilitation of patency of air passages

Airway Suctioning—Removal of airway secretions by inserting a suction catheter into the patient's oral airway and/or trachea

Allergy Management—Identification, treatment, and prevention of allergic responses to food, medications, insect bites, contrast material, blood, or other substances

Amnioinfusion—Infusion of fluid into the uterus during labor to relieve umbilical cord compression or to dilute meconium-stained fluid

Amputation Care—Promotion of physical and psychological healing before and after amputation of a body part

Analgesic Administration—Use of pharmacologic agents to reduce or eliminate pain

Analgesic Administration: Intraspinal—Administration of pharmacologic agents into the epidural or intrathecal space to reduce or eliminate pain

Anaphylaxis Management—Promotion of adequate ventilation and tissue perfusion for an individual with a severe allergic (antigen-antibody) reaction

Anesthesia Administration— Preparation for and administration of anesthetic agents and monitoring of patient responsiveness during administration

Anger Control Assistance—Facilitation of the expression of anger in an adaptive nonviolent manner

Animal-Assisted Therapy—Purposeful use of animals to provide affection, attention, diversion, and relaxation

Anticipatory Guidance—Preparation of patient for an anticipated developmental and/or situational crisis

Anxiety Reduction—Minimizing apprehension, dread, foreboding, or uneasiness

related to an unidentified source of anticipated danger

Area Restriction— Limitation of patient mobility to a specified area for purposes of safety or behavior management

Aromatherapy— Administration of essential oils through massage, topical ointments or lotions, baths, inhalation, douches, or compresses (hot or cold) to calm and soothe, provide pain relief, and enhance relaxation and comfort

Art Therapy— Facilitation of communication through drawings or other art forms

Artificial Airway Management— Maintenance of endotracheal and tracheostomy tubes and preventing complications associated with their use

Aspiration Precautions— Prevention or minimization of risk factors in the patient at risk for aspiration

Assertiveness Training— Assistance with the effective expression of feelings, needs, and ideas while respecting the rights of others

Asthma Management— Identification, treatment, and prevention of reactions to inflammation/constriction in airway passages

Attachment Promotion— Facilitation of the development of the parent-infant relationship

Autogenic Training— Assisting with self-suggestions about feelings of heaviness and warmth for the purpose of inducing relaxation

Autotransfusion— Collecting and reinfusing blood which has been lost intraoperatively or postoperatively from clean wounds

Bathing— Cleaning of the body for the purposes of relaxation, cleanliness, and healing

Bed Rest Care— Promotion of comfort and safety and prevention of complications for a patient unable to get out of bed

Bedside Laboratory Testing— Performance of laboratory tests at the bedside or point of care

Behavior Management— Helping a patient to manage negative behavior

Behavior Management: Overactivity/Inattention— Provision of a therapeutic milieu which safely accommodates the patient's attention deficit and/or overactivity while promoting optimal function

Behavior Management: Self-Harm— Assisting the patient to decrease or eliminate self-mutilating or self-abusive behaviors

Behavior Management: Sexual— Delineation and prevention of socially unacceptable sexual behaviors

Behavior Modification— Promotion of a behavior change

Behavior Modification: Social Skills— Assisting the patient to develop or improve interpersonal social skills

Bibliotherapy— Use of literature to enhance the expression of feelings and the gaining of insight

Biofeedback— Assisting the patient to modify a body function using feedback from instrumentation

Bioterrorism Preparedness— Preparing for an effective response to bioterrorism events or disaster

Birthing— Delivery of a baby

Bladder Irrigation— Instillation of a solution into the bladder to provide cleansing or medication

Bleeding Precautions— Reduction of stimuli that may induce bleeding or hemorrhage in at-risk patients

Bleeding Reduction— Limitation of the loss of blood volume during an episode of bleeding

Bleeding Reduction: Antepartum Uterus— Limitation of the amount of blood loss from the pregnant uterus during third trimester of pregnancy

Bleeding Reduction: Gastrointestinal— Limitation of the amount of blood loss from the upper and lower gastrointestinal tract and related complications

Bleeding Reduction: Nasal— Limitation of the amount of blood loss from the nasal cavity

Bleeding Reduction: Postpartum Uterus— Limitation of the amount of blood loss from the postpartum uterus

Bleeding Reduction: Wound— Limitation of the blood loss from a wound that may be a result of trauma, incisions, or placement of a tube or catheter

Blood Products Administration— Administration of blood or blood products and monitoring of patient's response

Body Image Enhancement— Improving a patient's conscious and unconscious perceptions and attitudes toward his/her body

Body Mechanics Promotion— Facilitating the use of posture and movement in daily activities to prevent fatigue and musculoskeletal strain or injury

Bottle Feeding— Preparation and administration of fluids to an infant via a bottle

Bowel Incontinence Care— Promotion of bowel continence and maintenance of perianal skin integrity

Bowel Incontinence Care: Encopresis— Promotion of bowel continence in children

Bowel Irrigation— Instillation of a substance into the lower gastrointestinal tract

Bowel Management— Establishment and maintenance of a regular pattern of bowel elimination

Bowel Training— Assisting the patient to train the bowel to evacuate at specific intervals

Breast Examination— Inspection and palpation of the breasts and related areas

Breastfeeding Assistance— Preparing a new mother to breastfeed her infant

Calming Technique— Reducing anxiety in patient experiencing acute distress

Capillary Blood Sample— Obtaining an arteriovenous sample from peripheral body site, such as the heel, finger, or other transcutaneous site

Cardiac Care— Limitation of complications resulting from an imbalance between myocardial oxygen supply and demand for a patient with symptoms of impaired cardiac function

Cardiac Care: Acute— Limitation of complications for a patient recently experiencing an episode of an imbalance between myocardial oxygen supply and demand resulting in impaired cardiac function

Cardiac Care: Rehabilitative— Promotion of maximum functional activity level for a patient who has suffered an episode of impaired cardiac function which resulted from an imbalance between myocardial oxygen supply and demand

Cardiac Precautions— Prevention of an acute episode of impaired cardiac function by minimizing myocardial oxygen consumption or increasing myocardial oxygen supply

Caregiver Support— Provision of the necessary information, advocacy, and support to facilitate primary patient care by someone other than a health care professional

Case Management— Coordinating care and advocating for specified individuals and patient populations across settings to reduce cost, reduce resource use, improve quality of health care, and achieve desired outcomes

Cast Care: Maintenance— Care of a cast after the drying period

Cast Care: Wet— Care of a new cast during the drying period

Cerebral Edema Management— Limitation of secondary cerebral injury resulting from swelling of brain tissue

Cerebral Perfusion Promotion— Promotion of adequate perfusion and limitation of complications for a patient experiencing or at risk for inadequate cerebral perfusion

Cesarean Section Care— Preparation and support of patient delivering a baby by cesarean section

Chemical Restraint— Administration, monitoring, and discontinuation of psychotropic agents used to control an individual's extreme behavior

Chemotherapy Management— Assisting the patient and family to understand the action and minimize side effects of antineoplastic agents

Chest Physiotherapy— Assisting the patient to move airway secretions from peripheral airways to more central airways for expectoration and/or suctioning

Childbirth Preparation— Providing information and support to facilitate childbirth and to enhance the ability of an individual to develop and perform the role of parent

Circulatory Care: Arterial Insufficiency— Promotion of arterial circulation

Circulatory Care: Mechanical Assist Device— Temporary support of the circulation through the use of mechanical devices or pumps

Circulatory Care: Venous Insufficiency— Promotion of venous circulation

Circulatory Precautions— Protection of a localized area with limited perfusion

Circumcision Care— Preprocedural and postprocedural support to males undergoing circumcision

Code Management— Coordination of emergency measures to sustain life

Cognitive Restructuring— Challenging a patient to alter distorted thought patterns and view self and the world more realistically

Cognitive Stimulation— Promotion of awareness and comprehension of surroundings by utilization of planned stimuli

Communicable Disease Management— Working with a community to decrease and manage the incidence and prevalence of contagious diseases in a specific population

Communication Enhancement: Hearing Deficit— Assistance in accepting and learning alternate methods for living with diminished hearing

Communication Enhancement: Speech Deficit— Assistance in accepting and learning alternate methods for living with impaired speech

Communication Enhancement: Visual Deficit— Assistance in accepting and learning alternate methods for living with diminished vision

Community Disaster Preparedness— Preparing for an effective response to a large-scale disaster

Community Health Development— Facilitating members of a community to identify a community's health concerns, mobilize resources, and implement solutions

Complex Relationship Building— Establishing a therapeutic relationship with a patient who has difficulty interacting with others

Conflict Mediation— Facilitation of constructive dialogue between opposing parties with a goal of resolving disputes in a mutually acceptable manner

Constipation/Impaction Management— Prevention and alleviation of constipation/impaction

Consultation— Using expert knowledge to work with those who seek help in problem-solving to enable individuals, families, groups, or agencies to achieve identified goals

Contact Lens Care— Prevention of eye injury and lens damage by proper use of contact lenses

Controlled Substance Checking— Promoting appropriate use and maintaining security of controlled substances

Coping Enhancement— Assisting a patient to adapt to perceived stressors, changes, or threats which interfere with meeting life demands and roles

Cost Containment— Management and facilitation of efficient and effective use of resources

Cough Enhancement— Promotion of deep inhalation by the patient with subsequent generation of high intrathoracic pressures and compression of underlying lung parenchyma for the forceful expulsion of air

Counseling— Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem-solving, and interpersonal relationships

Crisis Intervention— Use of short-term counseling to help the patient cope with a crisis and resume a state of functioning comparable to or better than the pre-crisis state

Critical Path Development— Constructing and using a timed sequence of patient care activities to enhance desired patient outcomes in a cost-efficient manner

Culture Brokerage— The deliberate use of culturally competent strategies to bridge or mediate between the patient's culture and the biomedical health care system

Cutaneous Stimulation— Stimulation of the skin and underlying tissues for the purpose of decreasing undesirable signs and symptoms such as pain, muscle spasm, or inflammation

Decision-Making Support— Providing information and support for a patient who is making a decision regarding health care

Delegation— Transfer of responsibility for the performance of patient care while retaining accountability for the outcome

Delirium Management— Provision of a safe and therapeutic environment for the patient who is experiencing an acute confusional state

Delusion Management— Promoting the comfort, safety, and reality orientation of a patient experiencing false, fixed beliefs that have little or no basis in reality

Dementia Management— Provision of a modified environment for the patient who is experiencing a chronic confusional state

Dementia Management: Bathing— Reduction of aggressive behavior during cleaning of the body

Deposition/Testimony— Provision of recorded sworn testimony for legal proceedings based upon knowledge of the case

Developmental Care— Structuring the environment and providing care in response to the behavioral cues and states of the preterm infant

Developmental Enhancement: Adolescent— Facilitating optimal physical, cognitive, social, and emotional growth of individuals during the transition from childhood to adulthood

Developmental Enhancement: Child— Facilitating or teaching parents/caregivers to facilitate the optimal gross motor, fine motor, language, cognitive, social, and emotional growth of preschool and school-aged children

Dialysis Access Maintenance— Preservation of vascular (arterial-venous) access sites

Diarrhea Management— Prevention and alleviation of diarrhea

Diet Staging— Instituting required diet restrictions with subsequent progression of diet as tolerated

Discharge Planning— Preparation for moving a patient from one level of care to another within or outside the current health care agency

Distraction— Purposeful focusing of attention away from undesirable sensations

Documentation— Recording of pertinent patient data in a clinical record

Dressing— Choosing, putting on, and removing clothes for a person who cannot do this for self

Dying Care— Promotion of physical comfort and psychological peace in the final phase of life

Dysreflexia Management— Prevention and elimination of stimuli which cause hyperactive reflexes and inappropriate autonomic responses in a patient with a cervical or high thoracic cord lesion

Dysrhythmia Management— Preventing, recognizing, and facilitating treatment of abnormal cardiac rhythms

Ear Care— Prevention or minimization of threats to ear or hearing

Eating Disorders Management— Prevention and treatment of severe diet restriction and overexercising or binging and purging of food and fluids

Electroconvulsive Therapy (ECT) Management— Assisting with the safe and efficient provision of electroconvulsive therapy in the treatment of psychiatric illness

Electrolyte Management— Promotion of electrolyte balance and prevention of complications resulting from abnormal or undesired serum electrolyte levels

Electrolyte Management: Hypercalcemia— Promotion of calcium balance and prevention of complications resulting from serum calcium levels higher than desired

Electrolyte Management: Hyperkalemia— Promotion of potassium balance and prevention of complications resulting

from serum potassium levels higher than desired

Electrolyte Management: Hypermagnesemia— Promotion of magnesium balance and prevention of complications resulting from serum magnesium levels higher than desired

Electrolyte Management: Hypernatremia— Promotion of sodium balance and prevention of complications resulting from serum sodium levels higher than desired

Electrolyte Management: Hyperphosphatemia— Promotion of phosphate balance and prevention of complications resulting from serum phosphate levels higher than desired

Electrolyte Management: Hypocalcemia— Promotion of calcium balance and prevention of complications resulting from serum calcium levels lower than desired

Electrolyte Management: Hypokalemia— Promotion of potassium balance and prevention of complications resulting from serum potassium levels lower than desired

Electrolyte Management: Hypomagnesemia— Promotion of magnesium balance and prevention of complications resulting from serum magnesium levels lower than desired

Electrolyte Management: Hyponatremia— Promotion of sodium balance and prevention of complications resulting from serum sodium levels lower than desired

Electrolyte Management: Hypophosphatemia— Promotion of phosphate balance and prevention of complications resulting from serum phosphate levels lower than desired

Electrolyte Monitoring— Collection and analysis of patient data to regulate electrolyte balance

Electronic Fetal Monitoring: Antepartum— Electronic evaluation of fetal heart rate response to movement, external stimuli, or uterine contractions during antepartal testing

Electronic Fetal Monitoring: Intrapartum— Electronic evaluation of fetal heart rate response to uterine contractions during intrapartal care

Elopement Precautions— Minimizing the risk of a patient leaving a treatment setting without authorization when departure presents a threat to the safety of patient or others

Embolus Care: Peripheral— Limitation of complications for a patient experiencing, or at risk for, occlusion of peripheral circulation

Embolus Care: Pulmonary— Limitation of complications for a patient experiencing, or at risk for, occlusion of pulmonary circulation

Embolus Precautions— Reduction of the risk of an embolus in a patient with thrombi or at risk for developing thrombus formation

Emergency Care— Providing life-saving measures in life-threatening situations

Emergency Cart Checking— Systematic review of the contents of an emergency cart at established time intervals

Emotional Support— Provision of reassurance, acceptance, and encouragement during times of stress

Endotracheal Extubation— Purposeful removal of the endotracheal tube from the nasopharyngeal or oropharyngeal airway

Energy Management— Regulating energy use to treat or prevent fatigue and optimize function

Enteral Tube Feeding— Delivering nutrients and water through a gastrointestinal tube

Environmental Management— Manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being

Environmental Management: Attachment Process— Manipulation of the patient's surroundings to facilitate the development of the parent-infant relationship

Environmental Management: Comfort— Manipulation of the patient's surroundings for promotion of optimal comfort

Environmental Management: Community— Monitoring and influencing the direction of the physical, social, cultural, economic, and political conditions that affect the health of groups and communities

Environmental Management: Home Preparation— Preparing the home for safe and effective delivery of care

Environmental Management: Safety— Monitoring and manipulation of the physical environment to promote safety

Environmental Management: Violence Prevention— Monitoring and manipulation of the physical environment to decrease the potential for violent behavior directed toward self, others, or environment

Environmental Management: Worker Safety— Monitoring and manipulating of the worksite environment to promote safety and health of workers

Environmental Risk Protection— Preventing and detecting disease and injury in populations at risk from environmental hazards

Examination Assistance— Providing assistance to the patient and another health care provider during a procedure or exam

Exercise Promotion— Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

Exercise Promotion: Strength Training— Facilitating regular resistive muscle

training to maintain or increase muscle strength

Exercise Promotion: Stretching— Facilitation of systematic slow-stretch-hold muscle exercises to induce relaxation, prepare muscles/joints for more vigorous exercise, or to increase or maintain body flexibility

Exercise Therapy: Ambulation— Promotion and assistance with walking to maintain or restore autonomic and voluntary body functions during treatment and recovery from illness or injury

Exercise Therapy: Balance— Use of specific activities, postures, and movements to maintain, enhance, or restore balance

Exercise Therapy: Joint Mobility— Use of active or passive body movement to maintain or restore joint flexibility

Exercise Therapy: Muscle Control— Use of specific activity or exercise protocols to enhance or restore controlled body movement

Eye Care— Prevention or minimization of threats to eye or visual integrity

Fall Prevention— Instituting special precautions with patient at risk for injury from falling

Family Integrity Promotion— Promotion of family cohesion and unity

Family Integrity Promotion: Childbearing Family— Facilitation of the growth of individuals or families who are adding an infant to the family unit

Family Involvement Promotion— Facilitating family participation in the emotional and physical care of the patient

Family Mobilization— Utilization of family strengths to influence patient's health in a positive direction

Family Planning: Contraception— Facilitation of pregnancy prevention by providing information about the physiology of reproduction and methods to control conception

Family Planning: Infertility— Management, education, and support of the patient and significant other undergoing evaluation and treatment for infertility

Family Planning: Unplanned Pregnancy— Facilitation of decision-making regarding pregnancy outcome

Family Presence Facilitation— Facilitation of the family's presence in support of an individual undergoing resuscitation and/or invasive procedures

Family Process Maintenance— Minimization of family process disruption effects

Family Support— Promotion of family values, interests, and goals

Family Therapy— Assisting family members to move their family toward a more productive way of living

Feeding— Providing nutritional intake for patient who is unable to feed self

Fertility Preservation— Providing information, counseling, and treatment that facilitate reproductive health and the ability to conceive

Fever Treatment— Management of a patient with hyperpyrexia caused by nonenvironmental factors

Financial Resource Assistance— Assisting an individual/family to secure and manage finances to meet health care needs

Fire-Setting Precautions— Prevention of fire-setting behaviors

First Aid— Providing initial care of a minor injury

Fiscal Resource Management— Procuring and directing the use of financial resources to ensure the development and continuation of programs and services

Flatulence Reduction— Prevention of flatus formation and facilitation of passage of excessive gas

Fluid Management— Promotion of fluid balance and prevention of complications resulting from abnormal or undesired fluid levels

Fluid Monitoring— Collection and analysis of patient data to regulate fluid balance

Fluid Resuscitation— Administering prescribed intravenous fluids rapidly

Fluid/Electrolyte Management— Regulation and prevention of complications from altered fluid and/or electrolyte levels

Foot Care— Cleansing and inspecting the feet for the purposes of relaxation, cleanliness, and healthy skin

Forgiveness Facilitation— Assisting an individual to forgive and/or experience forgiveness in relationship with self, others, and higher power

Gastrointestinal Intubation— Insertion of a tube into the gastrointestinal tract

Genetic Counseling— Use of an interactive helping process focusing on assisting an individual, family, or group, manifesting or at risk for developing or transmitting a birth defect or genetic condition, to cope

Grief Work Facilitation— Assistance with the resolution of a significant loss

Grief Work Facilitation: Perinatal Death— Assistance with the resolution of a perinatal loss

Guilt Work Facilitation— Helping another to cope with painful feelings of responsibility, actual or perceived

Hair Care— Promotion of neat, clean, attractive hair

Hallucination Management— Promoting the safety, comfort, and reality orientation of a patient experiencing hallucinations

Health Care Information Exchange— Providing patient care information to other health professionals

Health Education— Developing and providing instruction and learning experi-

ences to facilitate voluntary adaptation of behavior conducive to health in individuals, families, groups, or communities

Health Policy Monitoring— Surveillance and influence of government and organization regulations, rules, and standards that affect nursing systems and practices to ensure quality care of patients

Health Screening— Detecting health risks or problems by means of history, examination, and other procedures

Health System Guidance— Facilitating a patient's location and use of appropriate health services

Heat Exposure Treatment— Management of patient overcome by heat due to excessive environmental heat exposure

Heat/Cold Application— Stimulation of the skin and underlying tissues with heat or cold for the purpose of decreasing pain, muscle spasms, or inflammation

Hemodialysis Therapy— Management of extracorporeal passage of the patient's blood through a dialyzer

Hemodynamic Regulation— Optimization of heart rate, preload, afterload, and contractility

Hemofiltration Therapy— Cleansing of acutely ill patient's blood via a hemofilter controlled by the patient's hydrostatic pressure

Hemorrhage Control— Reduction or elimination of rapid and excessive blood loss

High-Risk Pregnancy Care— Identification and management of a high-risk pregnancy to promote healthy outcomes for mother and baby

Home Maintenance Assistance— Helping the patient/family to maintain the home as a clean, safe, and pleasant place to live

Hope Instillation— Facilitation of the development of a positive outlook in a given situation

Hormone Replacement Therapy— Facilitation of safe and effective use of hormone replacement therapy

Humor— Facilitating the patient to perceive, appreciate, and express what is funny, amusing, or ludicrous in order to establish relationships, relieve tension, release anger, facilitate learning, or cope with painful feelings

Hyperglycemia Management— Preventing and treating above normal blood glucose levels

Hypervolemia Management— Reduction in extracellular and/or intracellular fluid volume and prevention of complications in a patient who is fluid overloaded

Hypnosis— Assisting a patient to induce an altered state of consciousness to create an acute awareness and a directed focus experience

Hypoglycemia Management— Preventing and treating low blood glucose levels

Hypothermia Treatment— Rewarming and surveillance of a patient whose core body temperature is below 35°C

Hypovolemia Management— Expansion of intravascular fluid volume in a patient who is volume depleted

Immunization/Vaccination Management— Monitoring immunization status, facilitating access to immunizations, and providing immunizations to prevent communicable disease

Impulse Control Training— Assisting the patient to mediate impulsive behavior through application of problem-solving strategies to social and interpersonal situations

Incident Reporting— Written and verbal reporting of any event in the process of patient care that is inconsistent with desired patient outcomes or routine operations of the health care facility

Incision Site Care— Cleansing, monitoring, and promotion of healing in a wound that is closed with sutures, clips, or staples

Infant Care— Provision of developmentally appropriate family-centered care to the child under 1 year of age

Infection Control— Minimizing the acquisition and transmission of infectious agents

Infection Control: Intraoperative— Preventing nosocomial infection in the operating room

Infection Protection— Prevention and early detection of infection in a patient at risk

Insurance Authorization— Assisting the patient and provider to secure payment for health services or equipment from a third party

Intracranial Pressure (ICP) Monitoring— Measurement and interpretation of patient data to regulate intracranial pressure

Intrapartal Care— Monitoring and management of stages one and two of the birth process

Intrapartal Care: High-Risk Delivery— Assisting vaginal birth of multiple or malpositioned fetuses

Intravenous (IV) Insertion— Insertion of a needle into a peripheral vein for the purpose of administering fluids, blood, or medications

Intravenous (IV) Therapy— Administration and monitoring of intravenous fluids and medications

Invasive Hemodynamic Monitoring— Measurement and interpretation of invasive hemodynamic parameters to determine cardiovascular function and regulate therapy as appropriate

Kangaroo Care— Promoting closeness between parent and physiologically stable preterm infant by preparing the parent and providing the environment for skin-to-skin contact

Labor Induction— Initiation or augmentation of labor by mechanical or pharmacological methods

Labor Suppression— Controlling uterine contractions prior to 37 weeks of gestation to prevent preterm birth

Laboratory Data Interpretation— Critical analysis of patient laboratory data in order to assist with clinical decision-making

Lactation Counseling— Use of an interactive helping process to assist in maintenance of successful breastfeeding

Lactation Suppression— Facilitating the cessation of milk production and minimizing breast engorgement after giving birth

Laser Precautions— Limiting the risk of injury to the patient related to use of a laser

Latex Precautions— Reducing the risk of systemic reaction to latex

Learning Facilitation— Promoting the ability to process and comprehend information

Learning Readiness Enhancement— Improving the ability and willingness to receive information

Leech Therapy— Application of medicinal leeches to help drain replanted or transplanted tissue engorged with venous blood

Limit Setting— Establishing the parameters of desirable and acceptable patient behavior

Lower Extremity Monitoring— Collection, analysis, and use of patient data to categorize risk and prevent injury to the lower extremities

Malignant Hyperthermia Precautions— Prevention or reduction of hypermetabolic response to pharmacological agents used during surgery

Mechanical Ventilation— Use of an artificial device to assist a patient to breathe

Mechanical Ventilatory Weaning— Assisting the patient to breathe without the aid of a mechanical ventilator

Medication Administration— Preparing, giving, and evaluating the effectiveness of prescription and nonprescription drugs

Medication Administration: Ear— Preparing and instilling otic medications

Medication Administration: Enteral— Delivering medications through a tube inserted into the gastrointestinal system

Medication Administration: Eye— Preparing and instilling ophthalmic medications

Medication Administration: Inhalation— Preparing and administering inhaled medications

Medication Administration: Interpleural— Administration of medication through an interpleural catheter for reduction of pain

Medication Administration: Intradermal— Preparing and giving medications via the intradermal route

Medication Administration: Intramuscular (IM)— Preparing and giving medications via the intramuscular route

Medication Administration: Intraosseous— Insertion of a needle through the bone cortex into the medullary cavity for the purpose of short-term, emergency administration of fluid, blood, or medication

Medication Administration: Intraspinal— Administration and monitoring of medication via an established epidural or intrathecal route

Medication Administration: Intravenous (IV)— Preparing and giving medications via the intravenous route

Medication Administration: Nasal— Preparing and giving medications via nasal passages

Medication Administration: Oral— Preparing and giving medications by mouth

Medication Administration: Rectal— Preparing and inserting rectal suppositories

Medication Administration: Skin— Preparing and applying medications to the skin

Medication Administration: Subcutaneous— Preparing and giving medications via the subcutaneous route

Medication Administration: Vaginal— Preparing and inserting vaginal medications

Medication Administration: Ventricular Reservoir— Administration and monitoring of medication through an indwelling catheter into the lateral ventricle of the brain

Medication Management— Facilitation of safe and effective use of prescription and over-the-counter drugs

Medication Prescribing— Prescribing medication for a health problem

Meditation Facilitation— Facilitating a person to alter his/her level of awareness by focusing specifically on an image or thought

Memory Training— Facilitation of memory

Milieu Therapy— Use of people, resources, and events in the patient's immediate environment to promote optimal psychosocial functioning

Mood Management— Providing for safety, stabilization, recovery, and maintenance of a patient who is experiencing dysfunctionally depressed mood or elevated mood

Multidisciplinary Care Conference— Planning and evaluating patient care with health professionals from other disciplines

Music Therapy— Using music to help achieve a specific change in behavior, feeling, or physiology

Mutual Goal Setting— Collaborating with patient to identify and prioritize care goals, then developing a plan for achieving those goals

Nail Care— Promotion of clean, neat, attractive nails and prevention of skin lesions related to improper care of nails

Nausea Management— Prevention and alleviation of nausea

Neurologic Monitoring— Collection and analysis of patient data to prevent or minimize neurological complications

Newborn Care— Management of neonate during the transition to extrauterine life and subsequent period of stabilization

Newborn Monitoring— Measurement and interpretation of physiologic status of the neonate the first 24 hours after delivery

Nonnutritive Sucking— Provision of sucking opportunities for the infant

Normalization Promotion— Assisting parents and other family members of children with chronic illnesses or disabilities in providing normal life experiences for their children and families

Nutrition Management— Assisting with or providing a balanced dietary intake of foods and fluids

Nutrition Therapy— Administration of food and fluids to support metabolic processes of a patient who is malnourished or at high risk for becoming malnourished

Nutritional Counseling— Use of an interactive helping process focusing on the need for diet modification

Nutritional Monitoring— Collection and analysis of patient data to prevent or minimize malnourishment

Oral Health Maintenance— Maintenance and promotion of oral hygiene and dental health for the patient at risk for developing oral or dental lesions

Oral Health Promotion— Promotion of oral hygiene and dental care for a patient with normal oral and dental health

Oral Health Restoration— Promotion of healing for a patient who has an oral mucosa or dental lesion

Order Transcription— Transferring information from order sheets to the nursing patient care planning and documentation system

Organ Procurement— Guiding families through the donation process to ensure timely retrieval of vital organs and tissue for transplant

Ostomy Care— Maintenance of elimination through a stoma and care of surrounding tissue

Oxygen Therapy— Administration of oxygen and monitoring of its effectiveness

Pain Management— Alleviation of pain or a reduction in pain to a level of comfort that is acceptable to the patient

Parent Education: Adolescent— Assisting parents to understand and help their adolescent children

Parent Education: Childrearing Family— Assisting parents to understand and promote the physical, psychological, and social growth and development of their toddler, preschool, or school-aged child/children

Parent Education: Infant— Instruction on nurturing and physical care needed during the first year of life

Parenting Promotion— Providing parenting information, support, and coordination of comprehensive services to high-risk families

Pass Facilitation— Arranging a leave for a patient from a health care facility

Patient Contracting— Negotiating an agreement with an individual that reinforces a specific behavior change

Patient-Controlled Analgesia (PCA) Assistance— Facilitating patient control of analgesic administration and regulation

Patient Rights Protection— Protection of health care rights of a patient, especially a minor, incapacitated, or incompetent patient unable to make decisions

Peer Review— Systematic evaluation of a peer's performance compared with professional standards of practice

Pelvic Muscle Exercise— Strengthening and training the levator ani and urogenital muscles through voluntary, repetitive contraction to decrease stress, urge, or mixed types of urinary incontinence

Perineal Care— Maintenance of perineal skin integrity and relief of perineal discomfort

Peripheral Sensation Management— Prevention or minimization of injury or discomfort in the patient with altered sensation

Peripherally Inserted Central (PIC) Catheter Care— Insertion and maintenance of a peripherally inserted central catheter, either midline or centrally located

Peritoneal Dialysis Therapy— Administration and monitoring of dialysis solution into and out of the peritoneal cavity

Pessary Management— Placement and monitoring of a vaginal device for treating stress urinary incontinence, uterine retroversion, genital prolapse, or incompetent cervix

Phlebotomy: Arterial Blood Sample— Obtaining a blood sample from an uncannulated artery to assess oxygen and carbon dioxide levels and acid-base balance

Phlebotomy: Blood Unit Acquisition— Procuring blood and blood products from donors

Phlebotomy: Cannulated Vessel— Aspirating a blood sample through an indwelling vascular catheter for laboratory tests

Phlebotomy: Venous Blood Sample— Removal of a sample of venous blood from an uncannulated vein

Phototherapy: Mood/Sleep Regulation—Administration of doses of bright light in order to elevate mood and/or normalize the body's internal clock

Phototherapy: Neonate—Use of light therapy to reduce bilirubin levels in newborn infants

Physical Restraint—Application, monitoring, and removal of mechanical restraining devices or manual restraints which are used to limit physical mobility of a patient

Physician Support—Collaborating with physicians to provide quality patient care

Pneumatic Tourniquet Precautions—Applying a pneumatic tourniquet while minimizing the potential for patient injury from use of the device

Positioning—Deliberative placement of the patient or a body part to promote physiological and/or psychological well-being

Positioning: Intraoperative—Moving the patient or body part to promote surgical exposure while reducing the risk of discomfort and complications

Positioning: Neurologic—Achievement of optimal, appropriate body alignment for the patient experiencing or at risk for spinal cord injury or vertebrae irritability

Positioning: Wheelchair—Placement of a patient in a properly selected wheelchair to enhance comfort, promote skin integrity, and foster independence

Postanesthesia Care—Monitoring and management of the patient who has recently undergone general or regional anesthesia

Postmortem Care—Providing physical care of the body of an expired patient and support for the family viewing the body

Postpartal Care—Monitoring and management of the patient who has recently given birth

Preceptor: Employee—Assisting and supporting a new or transferred employee through a planned orientation to a specific clinical area

Preceptor: Student—Assisting and supporting learning experiences for a student

Preconception Counseling—Screening and providing information and support to individuals of childbearing age before pregnancy to promote health and reduce risks

Pregnancy Termination Care—Management of the physical and psychological needs of the woman undergoing a spontaneous or elective abortion

Premenstrual Syndrome (PMS) Management — Alleviation/attenuation of physical and/or behavioral symptoms occurring during the luteal phase of the menstrual cycle

Prenatal Care—Monitoring and management of patient during pregnancy to prevent complications of pregnancy and promote a healthy outcome for both mother and infant

Preoperative Coordination—Facilitating preadmission diagnostic testing and preparation of the surgical patient

Preparatory Sensory Information—Describing in concrete and objective terms the typical sensory experiences and events associated with an upcoming stressful health care procedure/treatment

Presence—Being with another, both physically and psychologically, during times of need

Pressure Management—Minimizing pressure to body parts

Pressure Ulcer Care—Facilitation of healing in pressure ulcers

Pressure Ulcer Prevention—Prevention of pressure ulcers for an individual at high risk for developing them

Product Evaluation—Determining the effectiveness of new products or equipment

Program Development—Planning, implementing, and evaluating a coordinated set of activities designed to enhance wellness, or to prevent, reduce, or eliminate one or more health problems for a group or community

Progressive Muscle Relaxation—Facilitating the tensing and releasing of successive muscle groups while attending to the resulting differences in sensation

Prompted Voiding—Promotion of urinary continence through the use of timed verbal toileting reminders and positive social feedback for successful toileting

Prosthesis Care—Care of a removable appliance worn by a patient and the prevention of complications associated with its use

Pruritus Management—Preventing and treating itching

Quality Monitoring—Systematic collection and analysis of an organization's quality indicators for the purpose of improving patient care

Radiation Therapy Management—Assisting the patient to understand and minimize the side effects of radiation treatments

Rape-Trauma Treatment—Provision of emotional and physical support immediately following a reported rape

Reality Orientation—Promotion of patient's awareness of personal identity, time, and environment

Recreation Therapy—Purposeful use of recreation to promote relaxation and enhancement of social skills

Rectal Prolapse Management—Prevention and/or manual reduction of rectal prolapse

Referral—Arrangement for services by another care provider or agency

Religious Addiction Prevention—Prevention of a self-imposed controlling religious lifestyle

Religious Ritual Enhancement—Facilitating participation in religious practices

Relocation Stress Reduction—Assisting the individual to prepare for and cope with movement from one equipment to another

Reminiscence Therapy—Using the recall of past events, feelings, and thoughts to facilitate pleasure, quality of life, or adaptation to present circumstances

Reproductive Technology Management—Assisting a patient through the steps of complex infertility treatment

Research Data Collection—Collecting research data

Resiliency Promotion—Assisting individuals, families, and communities in development, use, and strengthening of protective factors to be used in coping with environmental and societal stressors

Respiratory Monitoring—Collection and analysis of patient data to ensure airway patency and adequate gas exchange

Respite Care—Provision of short-term care to provide relief for family caregiver

Resuscitation—Administering emergency measures to sustain life

Resuscitation: Fetus—Administering emergency measures to improve placental perfusion or correct fetal acid-base status

Resuscitation: Neonate—Administering emergency measures to support newborn adaptation to extrauterine life

Risk Identification—Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

Risk Identification: Childbearing Family—Identification of an individual or family likely to experience difficulties in parenting and prioritization of strategies to prevent parenting problems

Risk Identification: Genetic—Identification and analysis of potential genetic risk factors in an individual, family, or group

Role Enhancement—Assisting a patient, significant other, and/or family to improve relationships by clarifying and supplementing specific role behaviors

Seclusion—Solitary containment in a fully protective environment with close surveillance by nursing staff for purposes of safety or behavior management

Security Enhancement—Intensifying a patient's sense of physical and psychological safety

Sedation Management—Administration of sedatives, monitoring of the patient's response, and provision of necessary physiological support during a diagnostic or therapeutic procedure

Seizure Management—Care of a patient during a seizure and the postictal state

Seizure Precautions—Prevention or minimization of potential injuries sustained by a patient with a known seizure disorder

Self-Awareness Enhancement—Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

Self-Care Assistance—Assisting another to perform activities of daily living

Self-Care Assistance: Bathing/Hygiene—Assisting patient to perform personal hygiene

Self-Care Assistance: Dressing/Grooming—Assisting patient with clothes and makeup

Self-Care Assistance: Feeding — Assisting a person to eat

Self-Care Assistance (IADL)—Assisting and instructing a person to perform instrumental activities of daily living (IADL) needed to function in the home or community

Self-Care Assistance: Toileting— Assisting another with elimination

Self-Care Assistance: Transfer— Assisting a person to change body location

Self-Esteem Enhancement—Assisting a patient to increase his/her personal judgment of self-worth

Self-Hypnosis Facilitation—Teaching and monitoring the use of self-initiated hypnotic state for therapeutic benefit

Self-Modification Assistance—Reinforcement of self-directed change initiated by the patient to achieve personally important goals

Self-Responsibility Facilitation— Encouraging a patient to assume more responsibility for own behavior

Sexual Counseling—Use of an interactive helping process focusing on the need to make adjustments in sexual practice or to enhance coping with a sexual event/disorder

Shift Report—Exchanging essential patient care information with other nursing staff at change of shift

Shock Management—Facilitation of the delivery of oxygen and nutrients to systemic tissue with removal of cellular waste products in a patient with severely altered tissue perfusion

Shock Management: Cardiac—Promotion of adequate tissue perfusion for a patient with severely compromised pumping function of the heart

Shock Management: Vasogenic—Promotion of adequate tissue perfusion for a patient with severe loss of vascular tone

Shock Management: Volume—Promotion of adequate tissue perfusion for a patient with severely compromised intravascular volume

Shock Prevention—Detecting and treating a patient at risk for impending shock

Sibling Support—Assisting a sibling to cope with a brother's or sister's illness/chronic condition/disability

Simple Guided Imagery—Purposeful use of imagination to achieve relaxation and/or direct attention away from undesirable sensations

Simple Massage— Stimulation of the skin and underlying tissues with varying degrees of hand pressure to decrease pain, produce relaxation, and/or improve circulation

Simple Relaxation Therapy— Use of techniques to encourage and elicit relaxation for the purpose of decreasing undesirable signs and symptoms such as pain, muscle tension, or anxiety

Skin Care: Donor Site— Prevention of wound complications and promotion of healing at the donor site

Skin Care: Graft Site— Prevention of wound complications and promotion of graft site healing

Skin Care: Topical Treatments— Application of topical substances or manipulation of devices to promote skin integrity and minimize skin breakdown

Skin Surveillance— Collection and analysis of patient data to maintain skin and mucous membrane integrity

Sleep Enhancement— Facilitation of regular sleep/wake cycles

Smoking Cessation Assistance— Helping another to stop smoking

Socialization Enhancement— Facilitation of another person's ability to interact with others

Specimen Management— Obtaining, preparing, and preserving a specimen for a laboratory test

Spiritual Growth Facilitation— Facilitation of growth in patient's capacity to identify, connect with, and call upon the source of meaning, purpose, comfort, strength, and hope in his/her life

Spiritual Support— Assisting the patient to feel balance and connection with a greater power

Splinting— Stabilization, immobilization, and/or protection of an injured body part with a supportive appliance

Sports-Injury Prevention: Youth— Reduce the risk of sport-related injury in young athletes

Staff Development— Developing, maintaining, and monitoring competence of staff

Staff Supervision— Facilitating the delivery of high-quality patient care by others

Subarachnoid Hemorrhage Precautions— Reduction of internal and external stimuli or stressors to minimize risk of rebleeding prior to aneurysm surgery

Substance Use Prevention— Prevention of an alcoholic or drug use lifestyle

Substance Use Treatment— Supportive care of patient/family members with physical and psychosocial problems associated with the use of alcohol or drugs

Substance Use Treatment: Alcohol Withdrawal— Care of the patient experiencing sudden cessation of alcohol consumption

Substance Use Treatment: Drug Withdrawal— Care of a patient experiencing drug detoxification

Substance Use Treatment: Overdose— Monitoring, treatment, and emotional support of a patient who has ingested prescription or over-the-counter drugs beyond the therapeutic range

Suicide Prevention— Reducing risk of self-inflicted harm with intent to end life

Supply Management— Ensuring acquisition and maintenance of appropriate items for providing patient care

Support Group— Use of a group environment to provide emotional support and health-related information for members

Support System Enhancement— Facilitation of support to patient by family, friends, and community

Surgical Assistance— Assisting the surgeon/dentist with operative procedures and care of the surgical patient

Surgical Precautions— Minimizing the potential for iatrogenic injury to the patient related to a surgical procedure

Surgical Preparation— Providing care to a patient immediately prior to surgery and verification of required procedures/tests and documentation in the clinical record

Surveillance— Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision-making

Surveillance: Community— Purposeful and ongoing acquisition, interpretation, and synthesis of data for decision-making in the community

Surveillance: Late Pregnancy— Purposeful and ongoing acquisition, interpretation, and synthesis of maternal-fetal data for treatment, observation, or admission

Surveillance: Remote Electronic— Purposeful and ongoing acquisition of patient data via electronic modalities (telephone, video, conferencing, e-mail) from distant locations as well as interpretation and synthesis of patient data for clinical decision-making with individuals or populations

Surveillance: Safety— Purposeful and ongoing collection and analysis of information about the patient and the environment for use in promoting and maintaining patient safety

Sustenance Support— Helping a needy individual/family to locate food, clothing, or shelter

Suturing— Approximating edges of a wound using sterile suture material and a needle

Swallowing Therapy— Facilitating swallowing and preventing complications of impaired swallowing

Teaching: Disease Process— Assisting the patient to understand information related to a specific disease process

Teaching: Foot Care—Preparing a patient at risk and/or significant other to provide preventive foot care

Teaching: Group—Development, implementation, and evaluation of a patient-teaching program for a group of individuals experiencing the same health condition

Teaching: Individual—Planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs

Teaching: Infant Nutrition—Instruction on nutrition and feeding practices during the first year of life

Teaching: Infant Safety—Instruction on safety during first year of life

Teaching: Infant Stimulation—Teaching parents and caregivers to provide developmentally appropriate sensory activities to promote development and movement during the first year of life

Teaching: Preoperative—Assisting a patient to understand and mentally prepare for surgery and the postoperative recovery period

Teaching: Prescribed Activity/Exercise—Preparing a patient to achieve and/or maintain a prescribed level of activity

Teaching: Prescribed Diet—Preparing a patient to correctly follow a prescribed diet

Teaching: Prescribed Medication—Preparing a patient to safely take prescribed medications and monitor for their effects

Teaching: Procedure/Treatment—Preparing a patient to understand and mentally prepare for a prescribed procedure or treatment

Teaching: Psychomotor Skill—Preparing a patient to perform a psychomotor skill

Teaching: Safe Sex—Providing instruction concerning sexual protection during sexual activity

Teaching: Sexuality—Assisting individuals to understand physical and psychosocial dimensions of sexual growth and development

Teaching: Toddler Nutrition—Instruction on nutrition and feeding practices during the second and third years of life

Teaching: Toddler Safety—Instruction on safety during the second and third years of life

Teaching: Toilet Training—Instruction on determining the child's readiness and strategies to assist the child to learn independent toileting skills

Technology Management—Use of technical equipment and devices to monitor patient condition or sustain life

Telephone Consultation—Eliciting patient's concerns, listening, and providing support, information, or teaching in response to patient's stated concerns, over the telephone

Telephone Follow-up—Providing results of testing or evaluating patient's response and determining potential for problems as a result of previous treatment, examination, or testing, over the telephone

Temperature Regulation—Attaining and/or maintaining body temperature within a normal range

Temperature Regulation: Intraoperative—Attaining and/or maintaining desired intraoperative body temperature

Temporary Pacemaker Management—Temporary support of cardiac pumping through the insertion and use of temporary pacemakers

Therapeutic Play—Purposeful and directive use of toys and other materials to assist children in communicating their perception and knowledge of their world and to help in gaining mastery of their environment

Therapeutic Touch—Attuning to the universal healing field, seeking to act as an instrument for healing influence, and using the natural sensitivity of the hands to gently focus and direct the intervention process

Therapy Group—Application of psychotherapeutic techniques to a group, including the utilization of interactions between members of the group

Total Parenteral Nutrition (TPN) Administration—Preparation and delivery of nutrients intravenously and monitoring of patient responsiveness

Touch—Providing comfort and communication through purposeful tactile contact

Traction/Immobilization Care—Management of a patient who has traction and/or a stabilizing device to immobilize and stabilize a body part

Transcutaneous Electrical Nerve Stimulation (TENS)—Stimulation of skin and underlying tissues with controlled, low-voltage electrical vibration via electrodes

Transport—Moving a patient from one location to another

Trauma Therapy: Child—Use of an interactive helping process to resolve a trauma experienced by a child

Triage: Disaster—Establishing priorities of patient care for urgent treatment while allocating scarce resources

Triage: Emergency Center—Establishing priorities and initiating treatment for patients in an emergency center

Triage: Telephone—Determining the nature and urgency of a problem(s) and providing directions for the level of care required, over the telephone

Truth Telling—Use of whole truth, partial truth, or decision delay to promote the patient's self-determination and well-being

Tube Care—Management of a patient with an external drainage device exiting the body

Tube Care: Chest—Management of a patient with an external water-seal drainage device exiting the chest cavity
Tube Care: Gastrointestinal—Management of a patient with a gastrointestinal tube
Tube Care: Umbilical Line—Management of a newborn with an umbilical catheter
Tube Care: Urinary—Management of a patient with urinary drainage equipment
Tube Care: Ventriculostomy/Lumbar Drain—Management of a patient with an external cerebrospinal fluid drainage system
Ultrasonography: Limited Obstetric—Performance of ultrasound exams to determine ovarian, uterine, or fetal status
Unilateral Neglect Management—Protecting and safely reintegrating the affected part of the body while helping the patient adapt to disturbed perceptual abilities
Urinary Bladder Training—Improving bladder function for those with urge incontinence by increasing the bladder's ability to hold urine and the patient's ability to suppress urination
Urinary Catheterization—Insertion of a catheter into the bladder for temporary or permanent drainage of urine
Urinary Catheterization: Intermittent—Regular periodic use of a catheter to empty the bladder
Urinary Elimination Management—Maintenance of an optimum urinary elimination pattern
Urinary Habit Training—Establishing a predictable pattern of bladder emptying to prevent incontinence for persons with limited cognitive ability who have urge, stress, or functional incontinence
Urinary Incontinence Care—Assistance in promoting continence and maintaining perineal skin integrity
Urinary Incontinence Care: Enuresis—Promotion of urinary continence in children
Urinary Retention Care—Assistance in relieving bladder distention
Values Clarification—Assisting another to clarify her/his own values in order to facilitate effective decision-making
Vehicle Safety Promotion—Assisting individuals, families, and communities to increase awareness of measures to reduce unintentional injuries in motorized and non-motorized vehicles
Venous Access Devices (VAD) Maintenance—Management of the patient with prolonged venous access via tunneled and non-tunneled (percutaneous) catheters, and implanted ports
Ventilation Assistance—Promotion of an optimal spontaneous breathing pattern that maximizes oxygen and carbon dioxide exchange in the lungs
Visitation Facilitation—Promoting beneficial visits by family and friends
Vital Signs Monitoring—Collection and analysis of cardiovascular, respiratory, and body temperature data to determine and prevent complications
Vomiting Management—Prevention and alleviation of vomiting
Weight Gain Assistance—Facilitating gain of body weight
Weight Management—Facilitating maintenance of optimal body weight and percent body fat
Weight Reduction Assistance—Facilitating loss of weight and/or body fat
Wound Care—Prevention of wound complications and promotion of wound healing
Wound Care: Closed Drainage—Maintenance of a pressure drainage system at the wound site
Wound Irrigation—Flushing of an open wound to cleanse and remove debris and excessive drainage

---

APPENDIX N4

Nursing Outcomes Classification System

Outcome Labels and Definitions

Abuse Cessation— Evidence that the victim is no longer exploited

Abuse Protection— Protection of self or dependent others from abuse

Abuse Recovery: Emotional— Extent of healing of psychological injuries due to abuse

Abuse Recovery: Financial— Extent of control of monetary and legal matters following financial exploitation

Abuse Recovery: Physical— Extent of healing of physical injuries due to abuse

Abuse Recovery: Sexual— Extent of healing of physical and psychological injuries due to sexual abuse or exploitation

Abuse Recovery Status— Extent of healing following physical or psychological abuse that may include sexual or financial exploitation

Abusive Behavior Self-Restraint— Self-restraint of abuse and neglectful behaviors towards others

Acceptance: Health Status— Reconciliation to significant change in health circumstances

Activity Tolerance— Psychological response to energy-consuming movements with daily activities

Adaptation to Physical Disability— Adaptive response to a significant functional challenge due to a physical disability

Adherence Behavior— Self-initiated actions to promote wellness, recovery, and rehabilitation

Aggression Self-Control— Self-restraint of assaultive, combative, or destructive behavior toward others

Allergic Response: Localized— Severity of localized hypersensitive immune response to a specific environmental (exogenous) antigen

Allergic Response: Systemic— Severity of systemic hypersensitive immune response to a specific environmental (exogenous) antigen

Ambulation— Ability to walk from place to place independently with or without assistive device

Ambulation: Wheelchair— Ability to move from place to place in a wheelchair

Anxiety Self-Control— Personal actions to eliminate or reduce feelings of apprehension, tension, or uneasiness from an unidentifiable source

Anxiety Level— Severity of manifested apprehension, tension, or uneasiness arising from an unidentifiable source

Appetite— Desire to eat when ill or receiving treatment

Aspiration Prevention— Personal actions to prevent the passage of fluid and solid particles into the lung

Asthma Self–Management— Personal actions to reverse inflammatory condition resulting in bronchial constriction of the airways

Balance— Ability to maintain body equilibrium

Blood Coagulation— Extent to which blood clots within normal period of time

Blood Glucose Level— Extent to which plasma glucose levels in plasma and urine are maintained in normal range

Blood Loss Severity— Severity of internal or external bleeding/hemorrhage

Blood Transfusion Reaction— Severity of complications with blood transfusion reaction

Body Image— Perception of own appearance and body functions

Body Mechanics Performance— Personal actions to maintain proper body alignment and to prevent muscular skeletal strain

Body Positioning: Self-Initiated— Ability to change own body position independently with or without assistive device

Bone Healing— Extent of regeneration of cells and tissues following bone injury

Bowel Continence— Control of passage of stool from the bowel

Bowel Elimination— Formation and evacuation of stool

Breastfeeding Establishment: Infant— Infant attachment to and sucking from the mother's breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Establishment: Maternal— Maternal establishment of proper attachment of an infant to and sucking from the breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Maintenance— Continuation of breastfeeding for nourishment of an infant/toddler

Breastfeeding Weaning— Progressive discontinuation of breastfeeding

Cardiac Disease Self-Management— Personal actions to manage heart disease and prevent disease progression

Cardiac Pump Effectiveness— Adequacy of blood volume ejected from the left ventricle to support systemic perfusion pressure

Caregiver Adaptation to Patient Institutionalization—Adaptive response of family caregiver when the care recipient is moved to an institution

Caregiver Emotional Health—Emotional well-being of a family care provider while caring for a family member

Caregiver Home Care Readiness—Extent of preparedness of a caregiver to assume responsibility for the health care of a family member in the home

Caregiver Lifestyle Disruption—Severity of disturbances in the lifestyle of a family member due to caregiving

Caregiver-Patient Relationship—Positive interactions and connections between the caregiver and care recipient

Caregiver Performance: Direct Care—Provision by family care provider of appropriate personal and health care for a family member

Caregiver Performance: Indirect Care—Arrangement and oversight by family care provider of appropriate care for a family member

Caregiver Physical Health—Physical well-being of a family care provider while caring for a family member

Caregiver Stressors—Severity of biopsychosocial pressure on a family care provider caring for another over an extended period of time

Caregiver Well-Being—Extent of positive perception of primary care provider's health status and life circumstances

Caregiving Endurance Potential—Factors that promote family care provider continuance over an extended period of time

Child Adaptation to Hospitalization—Adaptive response of a child from 3 years through 17 years of age to hospitalization

Child Development: 1 month—Milestones of physical, cognitive, and psychosocial progression by 1 month of age

Child Development: 2 months—Milestones of physical, cognitive, and psychosocial progression by 2 months of age

Child Development: 4 months—Milestones of physical, cognitive, and psychosocial progression by 4 months of age

Child Development: 6 months—Milestones of physical, cognitive, and psychosocial progression by 6 months of age

Child Development: 12 months—Milestones of physical, cognitive, and psychosocial progression by 12 months of age

Child Development: 2 years—Milestones of physical, cognitive, and psychosocial progression by 2 years of age

Child Development: 3 years—Milestones of physical, cognitive, and psychosocial progression by 3 years of age

Child Development: 4 years—Milestones of physical, cognitive, and psychosocial progression by 4 years of age

Child Development: Preschool—Milestones of physical, cognitive, and psychosocial progression from 3 years through 5 years of age

Child Development: Middle Childhood—Milestones of physical, cognitive, and psychosocial progression from 6 years through 11 years of age

Child Development: Adolescence—Milestones of physical, cognitive, and psychosocial progression from 12 years through 17 years of age

Circulation Status—Unobstructed, unidirectional blood flow at an appropriate pressure through large vessels of the systemic and pulmonary circuits

Client Satisfaction: Access to Care Resources—Extent of positive perception of access to nursing staff, supplies, and equipment needed for care

Client Satisfaction: Caring—Extent of positive perception of nursing staff's concern for the client

Client Satisfaction: Communication—Extent of positive perception of information exchanged between client and nursing staff

Client Satisfaction: Continuity of Care—Extent of positive perception of coordination of care as the patient moves from one care setting to another

Client Satisfaction: Cultural Needs Fulfillment—Extent of positive perception of integration of cultural beliefs, values, and social structures into nursing care

Client Satisfaction: Functional Assistance—Extent of positive perception of nursing assistance to achieve mobility and self-care as independently as health conditions permit

Client Satisfaction: Physical Care—Extent of positive perception of nursing care to maintain body functions and cleanliness

Client Satisfaction: Physical Environment—Extent of positive perception of living environment, treatment environment, equipment, and supplies in acute or long term care settings

Client Satisfaction: Protection of Rights—Extent of positive perception of protection of a client's legal and moral rights provided by nursing staff

Client Satisfaction: Psychological Care—Extent of positive perception of nursing assistance to perform emotional and mental activities as independently as health condition permits

Client Satisfaction: Safety—Extent of positive perception of procedures, information, and nursing care to prevent harm or injury

Client Satisfaction: Symptom Control—Extent of positive perception of nursing care to relieve symptoms of illness

Client Satisfaction: Teaching— Extent of positive perception of instruction provided by nursing staff to improve knowledge, understanding, and participation in care

Client Satisfaction: Technical Aspects of Care— Extent of positive perception of nursing staff's knowledge and expertise used in providing care

Cognition— Ability to execute complex mental processes

Cognitive Orientation— Ability to identify person, place, and time accurately

Comfort Level— Extent of positive perception of physical and psychological ease

Comfortable Death— Physical and psychological ease with the impending end of life

Communication— Reception, interpretation, and expression of spoken, written, and nonverbal messages

Communication: Expressive— Expression of meaningful verbal and/or nonverbal messages

Communication: Receptive— Reception and interpretation of verbal and/or nonverbal messages

Community Competence— Capacity of a community to collectively problem solve to achieve community goals

Community Disaster Readiness— Community preparedness to respond to a natural or man-made calamitous event

Community Health Status— The general state of well-being of a community or population

Community Health Status: Immunity— Resistance of community members to the invasion and spread of an infectious agent that could threaten public health

Community Risk Control: Chronic Disease— Community actions to reduce the risk of chronic diseases and related complications

Community Risk Control: Communicable Disease— Community actions to eliminate or reduce the spread of infectious agents (bacteria, fungi, parasites, and viruses) that threaten public health

Community Risk Control: Lead Exposure— Community actions to reduce lead exposure and poisoning

Community Risk Control: Violence— Community actions to eliminate or reduce intentional violent acts resulting in serious physical or psychological harm

Community Violence Level— Incidence of violent acts compared with local, state, or national values

Compliance Behavior— Personal actions to promote wellness, recovery, and rehabilitation based on professional advice

Concentration— Ability to focus on a specific stimulus

Coordinated Movement— Ability of muscles to work together voluntarily for purposeful movement

Coping— Personal actions to manage stressors that tax an individual's resources

Decision Making— Ability to make judgements and choose between two or more alternatives

Depression Self–Control— Personal actions to minimize melancholy and maintain interest in life events

Depression Level— Severity of melancholic mood and loss of interest in life events

Diabetes Self-Management— Personal actions to manage diabetes mellitus and prevent disease progression

Dignified Life Closure— Personal actions to maintain control during approaching end of life

Discharge Readiness: Independent Living— Readiness of a patient to relocate from a health care institution to living independently

Discharge Readiness: Supported Living— Readiness of a patient to relocate from a health care institution to a lower level of supported living

Distorted Thought Self-Control— Self-restraint or disruption in perception, thought processes, and thought content

Electrolyte Acid/Base Balance— Balance of the electrolytes and non-electrolytes in the intracellular and extracellular compartments of the body

Endurance— Capacity to sustain activity

Energy Conservation— Personal actions to manage energy for initiating and sustaining activity

Falls Occurrence— Number of falls in the past (define period of time)

Fall Prevention Behavior— Personal or family caregiver actions to minimize risk factors that might precipitate falls in the personal environment

Family Coping— Family actions to manage stressors that tax family resources

Family Functioning— Capacity of the family system to meet the needs of its members during developmental transitions

Family Health Status— Overall health and social competence of family unit

Family Integrity— Family members' behaviors that collectively demonstrate cohesion, strength, and emotional bonding

Family Normalization— Capacity of the family system to maintain routines and develop strategies for optimal functioning when a member has a chronic illness or disability

Family Participation in Professional Care— Family involvement in decision-making, delivery, and evaluation of care provided by health care personnel

Family Physical Environment— Physical arrangements in the home that provide safety and stimulation to family members

Family Resiliency— Capacity of the family system to successfully adapt and func-

tion competently following significant adversity or crises

Family Social Climate— Supportive milieu as characterized by family member relationships and goals

Family Support During Treatment— Family presence and emotional support for an individual undergoing treatment

Fear Self-Control— Personal actions to eliminate or reduce disabling feelings of apprehension, tension, or uneasiness from an identifiable source

Fear Level— Severity of manifested apprehension, tension, or uneasiness arising from an identifiable source

Fear Level: Child— Severity of manifested apprehension, tension, or uneasiness arising from an identifiable source in a child from 1 year through 17 years of age

Fetal Status: Antepartum— Extent to which fetal signs are within normal limits from conception to the onset of labor

Fetal Status: Intrapartum— Extent to which fetal signs are within normal limits from onset of labor to delivery

Fluid Balance— Water balance in the intracellular and extracellular compartments of the body

Fluid Overload Severity— Severity of excess fluids in the intracellular and extracellular compartments of the body

Grief Resolution— Adjustment to actual or impending loss

Growth— Normal increase in bone size and body weight during growth years

Health Beliefs— Personal convictions that influence health behaviors

Health Beliefs: Perceived Ability to Perform— Personal conviction that one can carry out a given health behavior

Health Beliefs: Perceived Control— Personal conviction that one can influence a health outcome

Health Beliefs: Perceived Resources— Personal conviction that one has adequate means to carry out a health behavior

Health Beliefs: Perceived Threat— Personal conviction that threatening health problem is serious and has potential negative consequences for lifestyle

Health Orientation— Personal commitment to health behaviors as lifestyle priorities

Health Promoting Behavior— Personal actions to sustain or increase wellness

Health Seeking Behavior— Personal actions to promote optimal wellness, recovery, and rehabilitation

Hearing Compensation Behavior— Personal actions to identify, monitor, and compensate for hearing loss

Hemodialysis Access— Functionality of a dialysis access site

Hope— Optimism that is personally satisfying and life-supporting

Hydration— Adequate water in the intracellular and extracellular compartments of the body

Hyperactivity Level— Severity of patterns of inattention or impulsivity in a child from 1 year through 17 years of age

Identity— Distinguishes between self and non-self and characterizes one's essence

Immobility Consequences: Physiological— Severity of compromise in physiological functioning due to impaired physical mobility

Immobility Consequences: Psycho-Cognitive— Severity of compromise in psycho-cognitive functioning due to impaired physical mobility

Immune Hypersensitivity Response— Severity of inappropriate immune responses

Immune Status— Natural and acquired appropriately targeted resistance to internal and external antigens

Immunization Behavior— Personal actions to obtain immunization to prevent a communicable disease

Impulse Self-Control— Self-restraint of compulsive or impulsive behaviors

Infection Severity— Severity of infection and associated symptoms

Infection Severity: Newborn— Severity of infection and associated symptoms during the first 28 days of life

Information Processing— Ability to acquire, organize, and use information

Joint Movement: Ankle— Active range of motion of the ankle with self-initiated movement

Joint Movement: Elbow— Active range of motion of the elbow with self-initiated movement

Joint Movement: Fingers— Active range of motion of the fingers with self-initiated movement

Joint Movement: Hip— Active range of motion of the hip with self-initiated movement

Joint Movement: Knee— Active range of motion of the knee with self-initiated movement

Joint Movement: Neck— Active range of motion of the neck with self-initiated movement

Joint Movement: Passive— Joint movement with assistance

Joint Movement: Shoulder— Active range of motion of the shoulder with self-initiated movement

Joint Movement: Spine— Active range of motion of the spine with self-initiated movement

Joint Movement: Wrist— Active range of motion of the wrist with self-initiated movement

Kidney Function— Filtration of blood and elimination of metabolic waste products through the formation of urine

Knowledge: Body Mechanics—Extent of understanding conveyed about proper body alignment, balance, and coordinated movement

Knowledge: Breastfeeding—Extent of understanding conveyed about lactation and nourishment of infant through breastfeeding

Knowledge: Cardiac Disease Management—Extent of understanding conveyed about heart disease and the prevention of complications

Knowledge: Child Physical Safety—Extent of understanding conveyed about safely caring for a child from 1 year through 17 years of age

Knowledge: Conception Prevention—Extent of understanding conveyed about prevention of unintended pregnancy

Knowledge: Diabetes Management—Extent of understanding conveyed about diabetes mellitus and the prevention of complications

Knowledge: Diet—Extent of understanding conveyed about recommended diet

Knowledge: Disease Process—Extent of understanding conveyed about a specific disease process

Knowledge: Energy Conservation—Extent of understanding conveyed about energy conservation techniques

Knowledge: Fall Prevention—Extent of understanding conveyed about prevention of falls

Knowledge: Fertility Promotion—Extent of understanding conveyed about fertility testing and the conditions that affect conception

Knowledge: Health Behavior—Extent of understanding conveyed about the promotion and protection of health

Knowledge: Health Promotion—Extent of understanding conveyed about information needed to obtain and maintain optimal health

Knowledge: Health Resources—Extent of understanding conveyed about relevant health care resources

Knowledge: Illness Care—Extent of understanding conveyed about illness-related information needed to achieve and maintain optimal health

Knowledge: Infant Care—Extent of understanding conveyed about caring for a baby from birth to 1st birthday

Knowledge: Infection Control—Extent of understanding conveyed about prevention and control of infection

Knowledge: Labor and Delivery—Extent of understanding conveyed about labor and vaginal delivery

Knowledge: Medication—Extent of understanding conveyed about the safe use of medication

Knowledge: Ostomy Care—Extent of understanding conveyed about maintenance of an ostomy for elimination

Knowledge: Parenting—Extent of understanding about provision of a nurturing and constructive environment for a child from 1 year through 17 years of age

Knowledge: Personal Safety—Extent of understanding conveyed about preventing unintentional injuries

Knowledge: Postpartum Maternal Health—Extent of understanding conveyed about maternal health following delivery

Knowledge: Preconception Maternal Health—Extent of understanding conveyed about maternal health prior to conception to ensure a healthy pregnancy

Knowledge: Pregnancy—Extent of understanding conveyed about promotion of a healthy pregnancy and prevention of complications

Knowledge: Prescribed Activity—Extent of understanding conveyed about prescribed activity and exercise

Knowledge: Sexual Functioning—Extent of understanding conveyed about sexual development and responsible sexual practices

Knowledge: Substance Use Control—Extent of understanding conveyed about controlling the use of drugs, tobacco, or alcohol

Knowledge: Treatment Procedure(s)—Extent of understanding conveyed about procedure(s) required as part of a treatment regimen

Knowledge: Treatment Regimen—Extent of understanding conveyed about a specific treatment regimen

Leisure Participation—Use of relaxing, interesting, and enjoyable activities to promote well-being

Loneliness Severity—Severity of emotional, social, or existential isolation response

Maternal Status: Antepartum—Extent to which maternal well-being is within normal limits from conception to the onset of labor

Maternal Status: Intrapartum—Extent to which maternal well-being is within normal limits from onset of labor to delivery

Maternal Status: Postpartum—Extent to which maternal well-being is within normal limits from delivery of placenta to completion of involution

Mechanical Ventilation Response: Adult—Alveolar exchange and tissue perfusion are supported by mechanical ventilation

Mechanical Ventilation Weaning Response: Adult—Respiratory and psychological adjustment to progressive removal of mechanical ventilation

Medication Response—Therapeutic and adverse effects of prescribed medication

Memory—Ability to cognitively retrieve and report previously stored information

Mobility— Ability to move purposefully in own environment independently with or without assistive device

Mood Equilibrium— Appropriate adjustment of prevailing emotional tone in response to circumstances

Motivation— Inner urge that moves or prompts an individual to positive action(s)

Nausea & Vomiting Control— Personal actions to control nausea, retching, and vomiting symptoms

Nausea & Vomiting Disruptive Effects— Severity of observed or reported disruptive effects of nausea, retching, and vomiting on daily functioning

Nausea & Vomiting Severity— Severity of nausea, retching, and vomiting symptoms

Neglect Cessation— Evidence that the victim is no longer receiving substandard care

Neglect Recovery— Extent of healing following the cessation of substandard care

Neurological Status— Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Neurological Status: Autonomic— Ability of the autonomic nervous system to coordinate visceral and homeostatic function

Neurological Status: Central Motor Control— Ability of the central nervous system to coordinate skeletal muscle activity for body movement

Neurological Status: Consciousness— Arousal, orientation, and attention to the environment

Neurological Status: Cranial Sensory/Motor Function— Ability of the cranial nerves to convey sensory and motor impulses

Neurological Status: Spinal Sensory/Motor Function— Ability of the spinal nerves to convey sensory and motor impulses

Newborn Adaptation— Adaptive response to the extrauterine environment by a physiologically mature newborn during the first 28 days

Nutritional Status— Extent to which nutrients are available to meet metabolic needs

Nutritional Status: Biochemical Measures— Body fluid components and chemical indices of nutritional status

Nutritional Status: Energy— Extent to which nutrients and oxygen provide cellular energy

Nutritional Status: Food and Fluid Intake— Amount of food and fluid taken into the body over a 24-hour period

Nutritional Status: Nutrient Intake— Adequacy of usual pattern of nutrient intake

Oral Hygiene— Condition of the mouth, teeth, gums, and tongue

Ostomy Self-Care— Personal actions to maintain ostomy for elimination

Pain: Adverse Psychological Response— Severity of observed or reported adverse cognitive and emotional responses to physical pain

Pain Control— Personal actions to control pain

Pain: Disruptive Effects— Severity of observed or reported disruptive effects of chronic pain on daily functioning

Pain Level— Severity of observed or reported pain

Parent-Infant Attachment— Parent and infant behaviors that demonstrate an enduring affectionate bond

Parenting Performance— Parental actions taken to provide a child a nurturing and constructive physical, emotional, and social environment

Parenting: Adolescent Physical Safety— Parental actions to avoid physical injury in an adolescent from 12 years through 17 years of age

Parenting: Early/Middle Childhood Physical Safety— Parental actions to avoid physical injury of a child from 3 years through 11 years of age

Parenting: Infant/Toddler Physical Safety— Parental actions to avoid physical injury to a child from birth through 2 years of age

Parenting: Psychosocial Safety— Parental actions to protect a child from social contacts that might cause harm or injury

Participation in Health Care Decisions— Personal involvement in selecting and evaluating health care options to achieve desired outcome

Personal Autonomy— Personal actions of a competent individual to exercise governance in life decisions

Personal Health Status— Overall physical, psychological, social, and spiritual functioning of an adult 18 years or older

Personal Safety Behavior— Personal actions of an adult to control behaviors that can cause physical injury

Personal Well-Being— An individual's expressed satisfaction with health status

Physical Aging— Normal physical changes that occur with the natural aging process

Physical Fitness— Performance of physical activities with vigor

Physical Injury Severity— Severity of injuries from accidents and trauma

Physical Maturation: Female— Normal physical changes in the female that occur with the transition from childhood to adulthood

Physical Maturation: Male— Normal physical changes in the male that occur

with the transition from childhood to adulthood

Play Participation— Use of activities by a child from 1 year through 11 years of age to promote enjoyment, entertainment, and development

Post Procedure Recovery Status— Extent to which an individual returns to baseline function following a procedure(s) requiring anesthesia or sedation

Prenatal Health Behavior— Personal actions to promote a healthy pregnancy and a healthy newborn

Preterm Infant Organization— Extrauterine integration of physiologic and behavioral function by the infant born 24 to 37 (term) weeks of gestation

Psychomotor Energy— Personal drive and energy to maintain activities of daily living, nutrition, and personal safety

Psychosocial Adjustment: Life Change— Adaptive psychosocial response of an individual to a significant life change

Quality of Life— Extent of positive perception of current life circumstances

Respiratory Status: Airway Patency— Open, clear tracheobronchial passages for air exchange

Respiratory Status: Gas Exchange— Alveolar exchange of CO_2 or O_2 to maintain arterial blood gas concentrations

Respiratory Status: Ventilation— Movement of air in and out of the lungs

Rest— Quantity and pattern of diminished activity for mental and physical rejuvenation

Risk Control— Personal actions to prevent, eliminate, or reduce modifiable health threats

Risk Control: Alcohol Use— Personal actions to prevent, eliminate, or reduce alcohol use that poses a threat to health

Risk Control: Cancer— Personal actions to detect or reduce the threat of cancer

Risk Control: Cardiovascular Health— Personal actions to eliminate or reduce threats to cardiovascular health

Risk Control: Drug Use— Personal actions to prevent, eliminate, or reduce drug use that poses a threat to health

Risk Control: Hearing Impairment— Personal actions to prevent, eliminate, or reduce threats to hearing function

Risk Control: Sexually Transmitted Diseases (STDs)— Personal actions to prevent, eliminate, or reduce behaviors associated with sexually transmitted disease

Risk Control: Tobacco Use— Personal actions to prevent, eliminate, or reduce tobacco use

Risk Control: Unintended Pregnancy— Personal actions to prevent or reduce the possibility of unintended pregnancy

Risk Control: Visual Impairment— Personal actions to prevent, eliminate, or reduce the threats to visual function

Risk Detection— Personal actions to identify personal health threats

Role Performance— Congruence of an individual's role behavior with role expectations

Safe Home Environment— Physical arrangements to minimize environmental factors that might cause physical harm or injury in the home

Seizure Control— Personal actions to reduce or minimize the occurrence of seizure episodes

Self-Care Status— Ability to perform basic personal care activities and household tasks

Self-Care: Activities of Daily Living (ADLs)— Ability to perform the most basic physical tasks and personal care activities independently with or without assistive device

Self-Care: Bathing— Ability to cleanse own body independently with or without assistive device

Self-Care: Dressing— Ability to dress oneself independently with or without assistive device

Self-Care: Eating— Ability to prepare and ingest food and fluid independently with or without assistive device

Self-Care: Hygiene— Ability to maintain own personal cleanliness and kept appearance independently with or without assistive device

Self-Care: Instrumental Activities of Daily Living (IADLs)— Ability to perform activities needed to function in the home or community independently with or without assistive device

Self-Care: Non-Parenteral Medication— Ability to administer oral and topical medications to meet therapeutic goals independently with or without assistive device

Self-Care: Oral Hygiene— Ability to care for own mouth and teeth independently with or without assistive device

Self-Care: Parenteral Medication— Ability to administer parenteral medications to meet therapeutic goals independently with or without assistive device

Self-Care: Toileting— Ability to toilet self independently with or without assistive device

Self-Direction of Care— Care recipient actions taken to direct others who assist with or perform physical tasks and personal health care

Self-Esteem— Personal judgment of self-worth

Self-Mutilation Restraint— Personal actions to refrain from intentional self-inflicted injury (non-lethal)

Sensory Function Status—Extent to which an individual correctly perceives skin stimulation, sounds, proprioception, taste and smell, and visual images
Sensory Function: Cutaneous—Extent to which stimulation of the skin is correctly sensed
Sensory Function: Hearing—Extent to which sounds are correctly sensed
Sensory Function: Proprioception—Extent to which the position and movement of the head and body are correctly sensed
Sensory Function: Taste and Smell—Extent to which chemicals inhaled or dissolved in saliva are correctly sensed
Sensory Function: Vision—Extent to which visual images are correctly sensed
Sexual Functioning—Integration of physical, socioemotional, and intellectual aspects of sexual expression and performance
Sexual Identity—Acknowledgment and acceptance of own sexual identity
Skeletal Function—Ability of the bones to support the body and facilitate movement
Sleep—Natural periodic suspension of consciousness during which the body is restored
Social Interaction Skills—Personal behaviors that promote effective relationships
Social Involvement—Social interactions with persons, groups, or organizations
Social Support—Perceived availability and actual provision of reliable assistance from others
Spiritual Health—Connectedness with self, others, higher power, all life, nature, and the universe that transcends and empowers the self
Stress Level—Severity of manifested physical or mental tension resulting from factors that alter an existing equilibrium
Student Health Status—Physical, cognitive/emotional, and social status of school age children that contribute to school attendance, participation in school activities, and ability to learn
Substance Addiction Consequences—Severity of change in health status and social functioning due to substance addiction
Suffering Severity—Severity of anguish associated with a distressing symptom, injury, or loss that has potential long-term effects
Suicide Self-Restraint—Personal actions to refrain from gestures and attempts at killing self
Swallowing Status—Safe passage of fluids and/or solids from the mouth to the stomach
Swallowing Status: Esophageal Phase—Safe passage of fluids and/or solids from the pharynx to the stomach
Swallowing Status: Oral Phase—Preparation, containment, and posterior movement of fluids and/or solids in the mouth
Swallowing Status: Pharyngeal Phase—Safe passage of fluids and/or solids from the mouth to the esophagus
Symptom Control—Personal actions to minimize perceived adverse changes in physical and emotional functioning
Symptom Severity—Severity of perceived adverse changes in physical, emotional, and social functioning
Symptom Severity: Perimenopause—Severity of symptoms caused by declining hormonal levels
Symptom Severity: Premenstrual Syndrome (PMS)—Severity of symptoms caused by cyclic hormonal fluctuations
Systemic Toxin Clearance: Dialysis—Clearance of toxins from the body with peritoneal or hemodialysis
Thermoregulation—Balance among heat production, heat gain, and heat loss
Thermoregulation: Newborn—Balance among heat production, heat gain, and heat loss during the first 28 days of life
Tissue Integrity: Skin and Mucous Membranes—Structural intactness and normal physiological function of skin and mucous membranes
Tissue Perfusion: Abdominal Organs—Adequacy of blood flow through the small vessels of the abdominal viscera to maintain organ function
Tissue Perfusion: Cardiac—Adequacy of blood flow through the coronary vasculature to maintain heart function
Tissue Perfusion: Cerebral—Adequacy of blood flow through the cerebral vasculature to maintain brain function
Tissue Perfusion: Peripheral—Adequacy of blood flow through the small vessels of the extremities to maintain tissue function
Tissue Perfusion: Pulmonary—Adequacy of blood flow through pulmonary vasculature to perfuse alveoli/capillary unit
Transfer Performance—Ability to change body location independently with or without assistive device
Treatment Behavior: Illness or Injury—Personal actions to palliate or eliminate pathology
Urinary Continence—Control of the elimination of urine from the bladder
Urinary Elimination—Collection and discharge of urine
Vision Compensation Behavior—Personal actions to compensate for visual impairment

Vital Signs—Extent to which temperature, pulse, respiration, and blood pressure are within normal range

Weight: Body Mass—Extent to which body weight, muscle, and fat are congruent to height, frame, gender, and age

Weight Control—Personal actions to achieve and maintain optimum body weight

Will to Live—Desire, determination, and effort to survive

Wound Healing: Primary Intention—Extent of regeneration of cells and tissues following intentional closure

Wound Healing: Secondary Intention—Extent of regeneration of cells and tissues in an open wound

APPENDIX N5
Home Health Care Classification (HHCC) System

HOME HEALTH CARE CLASSIFICATION NURSING COMPONENTS

Activity Cluster of elements that involve the use of energy in carrying out bodily functions.
Bowel Elimination Cluster of elements that involve the gastrointestinal system.
Cardiac Cluster of elements that involve the heart, blood vessels, and circulatory system.
Cognitive Cluster of elements involving the mental and cerebral processes.
Coping Cluster of elements that involve the ability to deal with responsibilities, problems, or difficulties.
Fluid Volume Cluster of elements that involve liquid consumption.
Health Behavior Cluster of elements that involve actions to sustain, maintain, or regain health.
Medication Cluster of elements that involve medicinal substances.
Metabolic Cluster of elements that involve the endocrine and immunological processes.
Nutritional Cluster of elements that involve the intake of food and nutrients.
Physical Regulation Cluster of elements that involve bodily processes.
Respiratory Cluster of elements that involve breathing and the pulmonary system.
Role Relationship Cluster of elements involving interpersonal, work, social, and sexual interactions.
Safety Cluster of elements that involve prevention of injury, danger, or loss.
Self-care Cluster of elements that involve the ability to carry out activities to maintain oneself.
Self-concept Cluster of elements that involve an individual's mental image of oneself.
Sensory Cluster of elements that involve senses.
Skin Integrity Cluster of elements that involve the mucous membrane, corneal, integumentary, and subcutaneous structures of the body.
Tissue Perfusion Cluster of elements that involve the oxygenation of tissues.
Urinary Elimination Cluster of elements that involve the genitourinary system.

HOME HEALTH CARE CLASSIFICATION OF NURSING DIAGNOSES*

activities of daily living (ADLs) alteration: Change or modification of ability to maintain oneself.
activity alteration: Change or modification in energy used by the body.
activity intolerance: Incapacity to carry out physiological or psychological daily activities.
activity intolerance risk: Increased chance of an incapacity to carry out physiological or psychological daily activities.
acute pain: Physical suffering or distress; to hurt.
adjustment impairment: Inadequate adaptation to condition or change in health status.
airway clearance impairment: Inability to clear secretions/obstructions in airway.
anticipatory grieving: Feeling great sorrow before the event or loss.
anxiety: Feeling of distress or apprehension whose source is unknown.
aspiration risk: Increased chance of material into trachea-bronchial passages.
auditory alteration: Diminished ability to hear.
bathing/hygiene deficit: Impaired ability to cleanse oneself.
blood pressure alteration: Change in the systolic or diastolic pressure.
body image disturbance: Imbalance in the perception of the way one's body looks.
body nutrition deficit: Less than adequate intake or absorption of food or nutrients.
body nutrition deficit risk: Increased chance of less than adequate intake or absorption of food or nutrients.
body nutrition excess: More than adequate intake or absorption of food or nutrients.
body nutrition excess risk: Increased chance of more than adequate intake or absorption of food or nutrients.
bowel elimination alteration: Change or modification of the gastrointestinal system.
bowel incontinence: Involuntary defecation.
breastfeeding impairment: Diminished ability to nourish infant at the breast.
breathing pattern impairment: Inadequate inhalation or exhalation.
cardiac output alteration: Change or modification in the pumping action of the heart.
cardiovascular alteration: Change or modification of the heart or blood vessels.
cerebral alteration: Change or modification of thought processes or mentation.
chronic low self-esteem disturbance: Persistent negative evaluation of oneself.

chronic pain: Pain that continues for longer than expected.
colonic constipation: Infrequent or difficult passage of hard, dry feces.
comfort alteration: Change or modification in sensation that is distressing.
communication impairment: Diminished ability to exchange thoughts, opinions, or information.
compromised family coping: Inability of family to function optimally.
decisional conflict: Struggle related to determining a course of action.
defensive coping: Self-protective strategies to guard against threats to self.
denial: Attempt to reduce anxiety by refusal to accept thoughts, feelings, or facts.
diarrhea: Abnormal frequency and fluidity of feces.
disabled family coping: Dysfunctional ability of family to function.
disuse syndrome: Group of symptoms related to effects of immobility.
diversional activity deficit: Lack of interest or engagement in leisure activities.
dressing/grooming deficit: Impaired ability to clothe and groom oneself.
dying process: Physical and behavioral responses associated with death.
dysfunctional grieving: Prolonged feeling of great sorrow.
dysreflexia: Life-threatening inhibited sympathetic response to a noxious stimuli in a person with a spinal cord injury at T7 or above.
endocrine alteration: Change or modification of internal secretions or hormones.
family coping impairment: Inadequate family response to problems or difficulties.
family processes alteration: Change or modification of usual functioning of a related group.
fatigue: Exhaustion that interferes with physical and mental activities.
fear: Feeling of dread or distress whose cause can be identified.
fecal impaction: Feces wedged in intestine.
feeding deficit: Impaired ability to feed oneself.
fluid volume alteration: Change or modification in bodily fluid.
fluid volume deficit: Dehydration.
fluid volume deficit risk: Increased chance of dehydration.
fluid volume excess: Fluid retention, overload, or edema.
fluid volume excess risk: Increased chance of fluid retention, overload, or edema.
functional urinary incontinence: Involuntary, unpredictable passage of urine.
gas exchange impairment: Imbalance of oxygen and carbon dioxide transfer between lung and vascular system.
gastrointestinal alteration: Change or modification of the stomach or intestines.
grieving: Feeling of great sorrow.
growth and development alteration: Change or modification in norms for age.
gustatory alteration: Diminished ability to taste.
health maintenance alteration: Change or modification in ability to manage health-related needs.
health-seeking behavior alteration: Change or modification of actions needed to improve health state.
home maintenance alteration: Inability to sustain a safe, healthy environment.
hopelessness: Feeling of despair or futility and passive abandonment.
hyperthermia: Abnormal high body temperature.
hypothermia: Subnormal low body temperature.
immunologic alteration: Change or modification of the immune system.
individual coping impairment: Inadequate personal response to problems or difficulties.
infection risk: Increased change of contamination with disease-producing germs.
infection unspecified: Unknown contamination with disease-producing germs.
injury risk: Increased chance of danger or loss.
instrumental activities of daily living (IADLs) alteration: Change or modification of more complex activities than those needed to maintain oneself.
kinesthetic alteration: Diminished ability to move.
knowledge deficit: Lack of information, understanding, or comprehension.
knowledge deficit of diagnostic test: Lack of information on tests to identify disease or assess health condition.
knowledge deficit of dietary regimen: Lack of information on the prescribed food or fluid intake.
knowledge deficit of disease process: Lack of information on the morbidity, course, or treatment of the health condition.
knowledge deficit of fluid volume: Lack of information on fluid volume intake requirements.
knowledge deficit of medication regimen: Lack of information on prescribed regulated course of medicinal substances.
knowledge deficit of safety precautions: Lack of information on measures to prevent injury, danger, or loss.
knowledge deficit of therapeutic regimen: Lack of information on regulated course of treating disease.
meaningfulness alteration: Change or modification of the ability to see the significance, purpose, or value in something.
medication risk: Increased chance of negative response to medicinal substance.
musculoskeletal alteration: Change or modification of the muscles, bones, or support structures.

noncompliance: Failure to follow therapeutic recommendations.
noncompliance of diagnostic test: Failure to follow therapeutic recommendations on tests to identify disease or assess health condition.
noncompliance of dietary regimen: Failure to follow the prescribed food or fluid intake.
noncompliance of fluid volume: Failure to follow fluid volume intake requirements.
noncompliance of medication regimen: Failure to follow prescribed regulated course of medicinal substances.
noncompliance of safety precautions: Failure to follow measures to prevent injury, danger, or loss.
noncompliance of therapeutic regimen: Failure to follow regulated course of treating disease.
nutrition alteration: Change or modification of food or nutrients.
olfactory alteration: Diminished ability to smell.
oral mucous membranes impairment: Diminished ability to maintain the tissues of the oral cavity.
parental role conflict: Struggle with parental position and responsibilities.
parenting alteration: Change or modification of nurturing figure's ability to promote growth and development of infant/child.
perceived constipation: Belief and treatment of infrequent or difficult passage of feces without cause.
peripheral alteration: Change or modification in vascularization of the extremities.
personal identity disturbance: Imbalance in the ability to distinguish between the self and the nonself.
physical mobility impairment: Diminished ability to perform independent movement.
physical regulation alteration: Change or modification of somatic control.
poisoning risk: Exposure to or ingestion of dangerous products.
polypharmacy: Use of two or more drugs together.
post-trauma response: Sustained behavior related to a traumatic event.
powerlessness: Feeling of helplessness, or inability to act.
protection alteration: Change or modification of the ability to guard against internal or external threats to the body.
rape trauma syndrome: Group of symptoms related to a forced sexual act.
respiration alteration: Change or modification in breathing.
reflex urinary incontinence: Involuntary passage of urine occurring at predictable intervals.
renal alteration: Change or modification in the kidneys.
role performance alteration: Change or modification of carrying out responsibilities.
self-care deficit: Impaired ability to maintain oneself.
self-concept alteration: Change or modification of ability to maintain one's image of self.
sensory perceptual alteration: Change in modification in the response to stimuli.
sexual dysfunction: Deleterious change in sex response.
sexuality patterns alteration: Change or modification of person's sexual response.
situational self-esteem disturbance: Negative evaluation of oneself in response to a loss or change.
skin integrity impairment: Diminished ability to maintain the integument.
skin integrity impairment risk: Increased chance of skin breakdown.
skin incision: Cutting of the integument.
sleep pattern disturbance: Imbalance in the normal sleep/wake cycle.
social interaction alteration: Inadequate quantity or quality of personal relations.
social isolation: State of aloneness, lack of interaction with others.
socialization alteration: Change or modification of personal identity.
spiritual distress: Anguish related to the spirit or soul.
spiritual state alteration: Change or modification of the spirit or soul.
stress urinary incontinence: Loss of urine occurring with increased abdominal pressure.
suffocation risk: Inadequate air for breathing.
swallowing impairment: Inability to move food from mouth to stomach.
tactile alteration: Diminished ability to feel.
thermoregulation impairment: Fluctuation of temperature between hypothermia and hyperthermia.
tissue integrity alteration: A change or modification in the mucous membrane, corneal, integumentary, or subcutaneous structures.
tissue perfusion alteration: A change or modification in the oxygenation of tissues.
toileting deficit: Impaired ability to urinate or defecate for oneself.
total urinary incontinence: Continuous and unpredictable loss of urine.
thought processes alteration: Change or modification in cognitive processes.
trauma risk: Accidental tissue injury.
unilateral neglect: Lack of awareness of one side of the body.
unspecified constipation: Other forms of abnormal feces or difficult passage of feces.

unspecified pain: Pain that is difficult to pinpoint.
urge urinary incontinence: Involuntary passage of urine following a sense of urgency to void.
urinary elimination alteration: A change or modification in the excretion of the waste matter of the kidneys.
urinary retention: Incomplete emptying of the bladder.
verbal impairment: Diminished ability to exchange thoughts, opinions, or information through speech.
violence risk: Increased chance of harming self or others.
visual alteration: A diminished ability to see.

HOME HEALTH CARE CLASSIFICATION OF NURSING INTERVENTIONS

abuse control: Actions to manage situations to avoid, detect, or minimize harm.
activities of daily living: Personal activities to maintain oneself.
activity care: Actions performed to carry out physiological daily activities.
adult day care: Actions to manage the provision of a day program for adults in a specific location.
allergic reaction care: Actions to reduce symptoms or precautions to reduce allergic reactions.
ambulation therapy: Actions to promote walking.
assistive device therapy: Actions to manage the use of products to aid in caring for oneself.
bedbound care: Actions performed to manage an individual confined to bed.
behavior care: Actions performed to manage observable responses to internal and external stimuli.
bereavement support: Actions to provide comfort to the family/friends of the person who died.
bill of rights: Statements related to entitlement during an episode of illness.
bladder care: Actions performed to manage urinary drainage problems.
bladder instillation: Actions to pour liquid in a catheter.
bladder training: Actions to provide instruction on the care of urinary drainage problems.
blood pressure: Actions to measure the diastolic and systolic pressure of the blood.
blood specimen analysis: Actions performed to collect and/or examine a sample of blood.
bowel care: Actions performed to maintain or restore functioning of the bowel.
bowel training: Actions to provide instruction on bowel elimination.
breathing exercises: Actions to provide instruction on respiratory or lung exertion.
cardiac care: Actions performed to manage changes in the heart or blood vessels.
cardiac rehabilitation: Actions taken to restore cardiac health.
cast care: Actions performed to manage a rigid dressing.
cataract care: Actions performed to control cataract conditions.
chemotherapy care: Actions performed to administer and monitor antineoplastic agents.
chest physiotherapy: Exercises to provide postural drainage of the lungs.
comfort care: Actions performed to enhance or improve well-being.
communication care: Actions performed to exchange verbal information.
community special programs: Actions to manage the provision of advice or instruction about a special community program resources.
compliance care: Actions performed to encourage conformity with therapeutic recommendations.
compliance with diet: Actions to encourage conformity with food or fluid intake.
compliance with fluid volume: Actions to encourage conformity to therapeutic intake of liquids.
compliance with medical regimen: Actions to encourage conformity to physician's plan of care.
compliance with medication regime: Actions to encourage conformity to follow prescribed course of medicinal substances.
compliance with safety precautions: Actions to encourage conformity with measures to protect self or others from injury, danger, or loss.
compliance with therapeutic regime: Actions to encourage conformity with the health team's plan of care.
coping support: Actions to sustain a person's dealing with responsibilities, problems, or difficulties.
counseling service: Actions to provide advice or instruction to help another.
decubitus care: Actions performed to prevent, detect, and treat skin integrity breakdown caused by pressure. Stage 1: actions performed to prevent skin breakdown. Stage 2: actions performed to manage tissue breakdown. Stage 3: actions performed to manage skin destruction. Stage 4: actions performed to manage open wounds.
denture care: Actions performed to manage artificial teeth.
diabetic care: Actions performed to control diabetic conditions.
dialysis care: Actions performed in the care and management of dialysis treatment.
disimpaction: Actions to manually remove feces.

drainage tube care: Actions performed to control drainage from tubes.
dressing change: Actions performed to remove and replace new bandage(s) to a wound.
dying/death measures: Actions performed to manage the dying process.
ear care: Actions performed to manage ear problems.
edema control: Actions to manage excess fluid in tissue.
emergency care: Actions performed to manage a sudden, unexpected occurrence.
emotional support: Actions to sustain a positive affective state.
enema: Actions performed to administer fluid rectally.
energy conservation: Actions taken to preserve energy.
enteral/parenteral feeding: Actions to provide nourishment through intravenous or gastrointestinal routes.
environmental safety: Precautions recommended to prevent or reduce environmental injury.
equipment safety: Precautions recommended to prevent or reduce equipment injury.
eye care: Actions performed to manage eye problems.
feeding technique: Actions using special measures to provide nourishment.
fluid therapy: Actions to provide liquid volume intake.
foot care: Actions performed to manage foot problems.
fracture care: Actions performed to manage broken bones.
funeral arrangements: Actions performed to manage preparatory measures for burial.
gastrostomy/nasogastric tube care: Actions performed to control gastrostomy/nasogastric drainage tubes.
gastrostomy/nasogastric tube insertion: Actions performed in the placement of a gastrostomy/nasogastric drainage tube.
gastrostomy/nasogastric tube irrigation: Actions performed to flush or wash out a gastrostomy/nasogastric tube.
health history: Actions to obtain information about past illness and health status.
health promotion: Actions performed to encourage behaviors to enhance health state.
hearing aid care: Actions performed to manage a hearing aid.
home health aide service: Actions performed to manage the provision of home care services by a home health aide.
home situation analysis: Analysis of living environment.
hospice: Actions to manage the provision of offering and/or providing care for terminally ill persons.
hydration status: Actions to manage the state of fluid balance.
immobilizer care: Actions to manage a splint, cast, or prescribed bed rest.
incision care: Actions performed to manage a surgical wound.
individual safety: Precautions to reduce individual injury.
infection control: Actions performed to manage communicable illness.
infusion care: Actions performed to manage solution given via vein.
inhalation therapy: Actions performed to manage breathing treatments.
injection administration: Actions performed to dispense a medication by a hypodermic.
instrumental activities of daily living (IADL): Complex activities performed to manage basic life skills.
insulin injection: Actions performed to manage a hypodermic administration of insulin.
intake/output: Actions performed to measure the amount of fluids/food and excretion of waste.
interpersonal dynamics analysis: Analysis of driving forces in a relationship between people.
intravenous care: Actions performed to manage the infusion.
meals-on-wheels: Actions performed to manage the provision of community program of meals delivered to the home.
medical regimen orders: Actions performed to manage the physician's plan of treatment.
medical social worker service: Actions performed to provide advice or instruction by medical social worker.
medication actions: Activities related to management or monitoring of medicinal substances.
medication administration: Actions performed to manage the dispensing of prescribed drugs.
medication prefill preparation: Activities to ensure the continued supply of prescribed drugs.
medication side effects: Actions performed to control untoward reactions or conditions to prescribed drugs.
mental health care: Actions taken to promote emotional well-being.
mental health history: Actions to obtain information about past and present emotional well-being.
mental health promotion: Actions to encourage or further emotional well-being.
mental health screening: Actions performed to systematically examine the emotional well-being.
mental health treatment: Actions to manage protocols used to treat emotional problems.
mobility therapy: Actions performed to advise and instruct on mobility deficits.

mouth care: Actions performed to manage oral cavity.
nurse care coordination: Actions performed to synthesize all plans of care.
nurse specialist service: Actions to obtain advice or instruction by advanced nurse specialists or nurse practitioners.
nursing contact: Actions to communicate with another nurse.
nursing status report: Actions performed to document condition by nurse.
nutrition care: Actions performed to manage food and nutrients.
occupational therapist service: Actions performed to provide advice or instruction by occupational therapist.
ostomy care: Actions performed to manage an artificial opening which removes waste products.
ostomy irrigation: Actions performed to flush or wash out of an ostomy.
other ancillary service: Actions performed to provide duties performed by other ancillary caregivers.
other community special program: Actions performed to manage the provision of advice or instruction for a specific community program resource.
other professional service: Actions performed to manage the duties performed by other professional caregivers.
other specimen analysis: Actions performed to collect and/or examine a sample of body tissue or fluid.
oxygen therapy care: Actions performed to manage administration of oxygen treatment.
pacemaker care Actions performed to manage an electronic device that provides a normal heartbeat.
pain control Actions performed to manage responses to injury or damage.
perineal care: Actions performed to manage perineal problems.
personal care: Actions performed to care for oneself.
physical examination: Actions performed to observe somatic events.
physical health care: Actions performed to manage somatic problems.
physical measurements: Actions performed to conduct procedures to evaluate somatic events.
physical therapist service: Actions performed to obtain advice or instruction by physical therapist.
physician contact: Actions performed to communicate with a physician.
physician status report: Actions performed to document condition by physician.
positioning therapy: Process to manage changes in body position.
professional/ancillary services: Actions performed to manage the duties performed by health team members.
psychosocial analysis: Study of psychological and social factors.
pulse: Actions performed to measure rhythmical beats of the heart.
radiation therapy care: Actions performed to administer and monitor radiation therapy.
range of motion: Actions performed to manage the active or passive exercises to maintain joint function.
reality orientation: Actions to promote the ability to locate oneself in the environment.
regular diet: Actions to manage ingestion of food and nutrients from established nutrition standards.
rehabilitation care: Actions performed to restore physical functioning.
rehabilitation exercise: Activities to promote physical functioning.
respiration: Actions performed to measure the function of breathing.
respiratory care: Actions taken to manage pulmonary hygiene.
safety precautions: Advance measures to avoid injury, danger, or harm.
skin breakdown control: Actions performed to manage tissue integrity problems.
skin care: Actions performed to manage the integument.
sleep pattern control: Actions performed to manage the sleep/wake cycle.
special diet: Actions to manage ingestion of food and nutrients prescribed for a specific purpose.
specimen analysis: Actions performed to manage the collection and/or examination of a bodily specimen.
speech therapist service: Actions performed to provide advice or instruction by a speech therapist.
spiritual comfort: Actions performed to console, restore, or promote spiritual health.
stool specimen analysis: Actions performed to collect and/or examine a sample of feces.
stress control: Actions performed to manage the physiological response of the body to a stimulus.
temperature: Actions performed to measure body temperature.
terminal care: Actions performed in the period of time surrounding death.
tracheostomy care: Actions performed to manage a tracheostomy.
transfer care: Actions performed to assist in moving from one place to another.
universal precautions: Practices to prevent spread of infection and infectious diseases.
urinary catheter care: Actions performed to manage a urinary catheter.
urinary catheter insertion: Actions performed to place a urinary catheter in bladder.

urinary catheter irrigation: Actions performed to flush out a urinary catheter.
urine specimen analysis: Actions performed to collect and/or examine a sample of urine.
venous catheter care: Actions performed to manage infusion equipment.
ventilator care: Actions performed to manage and monitor a ventilator.
violence control: Actions performed to manage behaviors which may cause harm to oneself or others.
vital signs: Actions performed to measure temperature, pulse, respiration, and blood pressure.
vitamin B_{12} injection: Actions performed to administer a hypodermic of Vitamin B_{12}.
wax removal: Actions performed to remove cerumen from ear.
weight control: Actions to manage obesity or debilitation.
wound care: Actions performed to manage open skin areas.

---

APPENDIX N6
Omaha System

The Omaha System is a research-based, comprehensive taxonomy that consists of the Problem Classification Scheme, the Intervention Scheme, and the Problem Rating Scale for Outcomes. Work on the Omaha System began in 1970 at the Visiting Nurse Association of Omaha (NE). Nurses from that agency and seven other test sites throughout the United States participated in four federally funded research projects between 1975 and 1993. The number and type of practice, education, and research sites that are adopting the Omaha System nationally and internationally are increasing dramatically. Numerous publications are available that describe the development, components, automation, and use of the Omaha System.

PROBLEM CLASSIFICATION SCHEME: An orderly, nonexhaustive, mutually exclusive, client-focused taxonomy of domains, modifiers, problems, and signs/symptoms addressed by nurses and other professionals. The four domains represent priority areas of professional and client health-related concerns. Each of the 40 problems may be referenced as health promotion, potential, or deficit/impairment/actual as well as individual or family. Actual problems are described by a cluster of signs and symptoms. As an open system of language and codes, the Problem Classification Scheme is used as a comprehensive method for collecting, sorting, classifying, documenting, and analyzing client data.

INTERVENTION SCHEME: An organized framework designed to address specific client problems or nursing diagnoses and consisting of three levels of nursing actions or activities. Four broad categories of interventions are further delineated by targets or objects of nursing action and by client-specific information generated by the nurse or other professional. Because the Intervention Scheme is the basis for planning and intervening, it enables professionals to describe and communicate their practice including improving, maintaining, or restoring health and preventing illness.

PROBLEM RATING SCALE FOR OUTCOMES: A five-point, Likert-type scale for measuring the entire range of severity for the concepts of knowledge, behavior, and status. Each of the three subscales is a continuum providing an evaluation framework for examining problem-specific client ratings at regular or predictable times. Suggested times include admission, specific interim points, and dismissal. The ratings are a guide for the nurse or other professional as client care is planned and provided; the ratings offer a method to monitor client progress throughout the period of service. SEE: table.

DOMAINS AND PROBLEMS OF THE PROBLEM CLASSIFICATION SCHEME

Domain I. Environmental:
The material resources, physical surroundings, and substances both internal and external to the client, home neighborhood, and broader community; appears at the first level of the Problem Classification Scheme.

01. Income
02. Sanitation
03. Residence
04. Neighborhood/workplace safety
05. Other

Domain II. Psychosocial:
Patterns of behavior, communication, relationships, and development; appears at the first level of the Problem Classification Scheme.

06. Communication with community resources
07. Social contact
08. Role change
09. Interpersonal relationship
10. Spirituality
11. Grief
12. Emotional stability
13. Human sexuality
14. Caretaking/parenting
15. Neglected child/adult
16. Abused child/adult
17. Growth and development
18. Other

Domain III. Physiological:
Functional status of processes that maintain life; appears at the first level of the Problem Classification Scheme.

19. Hearing
20. Vision
21. Speech and language
22. Dentition
23. Cognition
24. Pain
25. Consciousness
26. Integument
27. Neuro-musculo-skeletal function
28. Respiration
29. Circulation
30. Digestion-hydration
31. Bowel function
32. Genitourinary function
33. Antepartum/postpartum
34. Other

Domain IV. Health-Related Behaviors:
Activities that maintain or promote wellness, promote recovery, or maximize rehabilitation potential; appears at the first level of the Problem Classification Scheme.

35. Nutrition
36. Sleep and rest patterns
37. Physical activity
38. Personal hygiene
39. Substance use
40. Family planning
41. Health care supervision
42. Prescribed medication regimen
43. Technical procedure
44. Other

CATEGORIES AND TARGETS OF THE INTERVENTION SCHEME

I. Health Teaching, Guidance, and Counseling
Health teaching, guidance, and counseling are activities that range from giving information, anticipating client problems, encouraging client action and responsibility for self-care and coping, to assisting with decision making and problem solving. The overlapping concepts occur on a continuum with the variation due to the client's self-direction capabilities.
II. Treatments and Procedures
Treatments and procedures are technical activities directed toward preventing signs and symptoms, identifying risk factors and early signs and symptoms, and decreasing or alleviating signs and symptoms.
III. Case Management
Case management includes activities of coordination, advocacy, and referral. These activities involve facilitating service delivery on behalf of the client, communicating with health and human service providers, promoting assertive client communication, and guiding the client toward use of appropriate community resources.
IV. Surveillance
Surveillance includes activities of detection, measurement, critical analysis, and monitoring to indicate client status in relation to a given condition or phenomenon.

01. Anatomy/physiology
02. Behavior modification
03. Bladder care
04. Bonding
05. Bowel care
06. Bronchial hygiene
07. Cardiac care
08. Caretaking/parenting skills
09. Cast care
10. Communication
11. Coping skills
12. Day care/respite

13. Discipline
14. Dressing change/wound care
15. Durable medical equipment
16. Education
17. Employment
18. Environment
19. Exercises
20. Family planning
21. Feeding procedures
22. Finances
23. Food
24. Gait training
25. Growth/development
26. Homemaking
27. Housing
28. Interaction
29. Lab findings
30. Legal system
31. Medical/dental care
32. Medication action/side effects
33. Medication administration
34. Medication set-up
35. Mobility/transfers
36. Nursing care, supplementary
37. Nutrition
38. Nutritionist
39. Ostomy care
40. Other community resource
41. Personal care
42. Positioning
43. Rehabilitation
44. Relaxation/breathing techniques
45. Rest/sleep
46. Safety
47. Screening
48. Sickness/injury case
49. Signs/symptoms—mental/emotional
50. Signs/symptoms—physical
51. Skin care
52. Social work/counseling
53. Specimen collection
54. Spiritual care
55. Stimulation/nurturance
56. Stress management
57. Substance use
58. Supplies
59. Support group
60. Support system
61. Transportation
62. Wellness
63. Other

PROBLEM RATING SCALE FOR OUTCOMES

Concept	*1*	*2*	*3*	*4*	*5*
Knowledge: the ability of the client to remember and interpret information	No knowledge	Minimal knowledge	Basic knowledge	Adequate knowledge	Superior knowledge
Behavior: the observable responses, actions, or activities of the client fitting the occasion or purpose	Not appropriate	Rarely appropriate	Inconsistently appropriate	Usually appropriate	Consistently appropriate
Status: the condition of the client in relation to objective and subjective defining characteristics	Extreme signs/ symptoms	Severe signs/ symptoms	Moderate signs/ symptoms	Minimal signs/ symptoms	No signs/symptoms

APPENDIX N7

Nursing Diagnoses *

Quick View of Contents

Appendix		Page
N7–1	Gordon's Functional Health Patterns	2654
N7–2	Doenges & Moorhouse's Diagnostic Divisions	2656
N7–3	Additional Nursing Diagnoses Approved Through 2003–2004	2658
N7–4	Nursing Diagnoses Grouped by Diseases/Disorders	2658
N7–5	Nursing Diagnoses Through 2003–2004 in Alphabetical Order	2724

Appendices N7–1 and N7–2 Organize all approved NANDA nursing diagnoses by two nursing models: Gordon's Functional Health Patterns and Doenges and Moorhouse's Diagnostic Divisions. The use of a nursing model as a framework helps to organize the data needed to identify and validate nursing diagnoses.

Appendix N7–3 Lists the most recently approved NANDA nursing diagnoses (2003–2004) for quick reference.

Appendix N7–4 Provides a guide to choosing appropriate nursing diagnoses by alphabetically listing almost 300 diseases/disorders with their commonly associated nursing diagnoses. Each of the listed diseases/disorders has been cross-referenced from its position in the body of the dictionary. The nursing diagnoses are written in the form of patient problem statements, also known as PES format (Problem, Etiology, Signs/Symptoms). The phrases "may be related to" and "possibly evidenced by" in the patient problem statements serve to help one individualize the care for the specific patient situations. A "risk for" diagnosis is not evidenced by signs and symptoms, as the problem has not occurred and nursing interventions are directed at prevention. Because the patient's health status is perpetual and ongoing, other nursing diagnoses may be appropriate based on changing patient situations. To identify other applicable nursing diagnoses, check Appendix N7–1, then turn to Appendix N7–5 to test and validate your choices.

Appendix N7–5 Details the NANDA-approved diagnoses through 2003–2004 in alphabetical order with their associated etiology [Related/Risk Factors] and signs and symptoms [Defining Characteristics]. This specific focus on assessment data/evaluation criteria helps you complete the validation process.

*Adapted from North American Nursing Diagnosis Association (2003). NANDA Nursing Diagnoses: Definitions and Classification 2003–2004. Philadelphia: NANDA, with permission.

Appendix N7–1 Gordon's Functional Health Patterns

HEALTH PERCEPTION—HEALTH MANAGEMENT PATTERN

Death Syndrome, risk for Sudden Infant
Energy Field Disturbance
Environmental Interpretation Syndrome, impaired
Falls, risk for
Health Maintenance, ineffective
Health-Seeking Behaviors (specify)
Infection, risk for
Injury (trauma), risk for
Latex Allergy
Latex Allergy, risk for
Noncompliance (specify)
Perioperative Positioning Injury, risk for
Poisoning, risk for
Protection, ineffective
Recovery, Delayed Surgical
Suffocation, risk for
Suicide, risk for
Therapeutic Regimen: effective management
Therapeutic Regimen: ineffective management
Therapeutic Regimen management: readiness for enhanced
Therapeutic Regimen: Family, ineffective management
Therapeutic Regimen: Community, ineffective management
Trauma, risk for
Wandering (specify sporadic or continual)

NUTRITIONAL—METABOLIC PATTERN

Aspiration, risk for
Body Temperature, imbalanced, risk for
Breastfeeding, effective
Breastfeeding, ineffective
Breastfeeding, interrupted
Dentition, impaired
Failure to thrive, adult
Fluid Balance, readiness for enhanced
Fluid Volume, risk for deficient
Fluid Volume Deficit [active loss]
Fluid Volume Deficit [regulatory failure]
Fluid Volume Deficit, risk for
Fluid Volume Excess
Fluid Volume Imbalance, risk for
Hyperthermia
Hypothermia
Infant Feeding Pattern, ineffective
Latex Allergy Response
Latex Allergy Response, risk for
Nausea
Nutrition: imbalanced, less than body requirements
Nutrition: imbalanced, more than body requirements
Nutrition: imbalanced, risk for more than body requirements
Nutrition: readiness for enhanced
Oral Mucous Membrane, impaired
Skin Integrity, impaired
Skin Integrity, impaired, risk for
Swallowing, impaired
Thermoregulation, ineffective
Tissue Integrity, impaired

ELIMINATION PATTERN

Bowel Incontinence
Constipation
Constipation, perceived
Constipation, risk for
Diarrhea
Failure to Thrive, Adult
Growth, risk for altered
Hyperthermia
Hypothermia
Incontinence, functional
Incontinence, reflex
Incontinence, stress
Incontinence, total
Incontinence, urge
Urinary Elimination, impaired
Urinary Elimination, readiness for enhanced
Urinary Retention [acute/chronic]
Urinary Urge Incontinence, risk for

ACTIVITY—EXERCISE PATTERN

Activity Intolerance [specify level]
Activity Intolerance, risk for
Adaptive Capacity, decreased, intracranial
Airway Clearance, ineffective
Autonomic Dysreflexia
Autonomic Dysreflexia, risk for
Bed Mobility, impaired
Breathing Pattern, ineffective
Cardiac Output, decreased
Development, Altered, risk for
Development, risk for delayed
Disorganized Infant Behavior
Disorganized Infant Behavior, risk for
Disuse Syndrome, risk for
Diversional Activity Deficient
Dysfunctional Ventilatory Weaning Response
Dysreflexia
Dysreflexia, Autonomic, risk for
Enhanced Organized Infant Behavior, potential for
Fatigue
Gas Exchange, impaired
Growth and Development, altered
Growth and Development, delayed
Growth, risk for disproportionate
Home Maintenance, impaired

Home Maintenance Management, impaired
Infant Behavior, disorganized
Infant Behavior, readiness for enhanced organized
Infant Behavior, risk for disorganized
Injury, Preoperative Positioning, risk for
Mobility, Bed, impaired
Mobility, Wheelchair, impaired
Peripheral Neurovascular Dysfunction, risk for
Physical Mobility, impaired
Self-Care Deficit [specify level]: feeding, bathing/hygiene, dressing/grooming, toileting
Spontaneous Ventilation, inability to sustain
Surgical Recovery, delayed
Tissue Perfusion, altered (specify): cerebral, cardiopulmonary, renal, gastrointestinal, peripheral
Transfer ability, impaired
Ventilation, impaired spontaneous
Ventilatory Weaning Response, dysfunctional (DVWR)
Walking, impaired
Wandering
Wheelchair Mobility, impaired
Wheelchair Transfer Ability, impaired

SLEEP—REST PATTERN
Sleep, readiness for enhanced
Sleep Deprivation
Sleep Pattern Disturbance

COGNITIVE—PERCEPTUAL PATTERN
Adaptive Capacity: intracranial, decreased
Confusion, acute
Confusion, chronic
Decisional Conflict
Environmental Interpretation Syndrome, impaired
Knowledge, readiness for enhanced
Knowledge Deficit [learning need] (specify)
Memory, impaired
Pain
Pain, acute
Pain, chronic
Sensory/Perceptual Alterations (specify): visual, auditory, kinesthetic, gustatory, tactile, olfactory
Thought Processes, altered
Thought Processes, disturbed
Unilateral Neglect

SELF-PERCEPTION—SELF-CONCEPT PATTERN
Anxiety [Mild, Moderate, Severe, Panic]
Anxiety, death
Body Image Disturbance
Fear
Hopelessness
Loneliness, risk for
Personal Identity Disturbance
Powerlessness
Powerlessness, risk for
Self-Concept, readiness for enhanced
Self-Esteem, chronic low
Self-Esteem Disturbance
Self-Esteem, situational low
Self-Esteem, situational low, risk for
Self-Mutilation
Self-Mutilation, risk for
Violence, risk for self-directed

ROLE—RELATIONSHIP PATTERN
Caregiver Role Strain
Caregiver Role Strain, risk for
Communication, impaired, verbal
Communication, readiness for enhanced
Family process, altered: alcoholism [substance abuse]
Family processes, altered
Family processes, interrupted
Family processes, readiness for enhanced
Grieving, anticipatory
Grieving, dysfunctional
Parental Role Conflict
Parent/Infant/Child Attachment, altered, risk for
Parenting, altered
Parenting, altered, risk for
Parenting, impaired
Relocation Stress Syndrome
Relocation Stress Syndrome, risk for
Role Performance, altered
Role Performance, ineffective
Social Interaction, impaired
Social Isolation
Sorrow, chronic
Violence, Directed at Others, risk for
Violence, Self-Directed, risk for

SEXUALITY—REPRODUCTIVE PATTERN
Rape-Trauma Syndrome [specify]
Rape-Trauma Syndrome: compound reaction
Rape-Trauma Syndrome: silent reaction
Sexual Dysfunction
Sexuality Patterns, ineffective

COPING—STRESS TOLERANCE PATTERN
Adjustment, impaired
Community Coping, enhanced, potential for
Community Coping, ineffective
Coping, defensive
Coping, enhanced, readiness for
Coping, individual, ineffective

Appendix N7–4 Nursing Diagnoses Grouped by Diseases/ Disorders

abortion, spontaneous

Fluid Volume,deficient [isotonic] may be related to excessive blood loss, possibly evidenced by decreased pulse volume and pressure, delayed capillary refill, or changes in sensorium.

Spiritual Distress, risk for: risk factors may include need to adhere to personal religious beliefs/practices, blame for loss directed at self or God.

Knowledge, deficient [Learning Need] regarding cause of abortion, self-care, contraception/future pregnancy may be related to lack of familiarity with new self/health care needs, sources for support, possibly evidenced by requests for information and statement of concern/misconceptions, development of preventable complications.

Grieving [expected] related to perinatal loss, possibly evidenced by crying, expressions of sorrow, or changes in eating habits/sleep patterns.

Sexuality Patterns, risk for ineffective: risk factors may include increasing fear of pregnancy and/or repeat loss, impaired relationship with significant other(s), self-doubt regarding own femininity.

abruptio placentae

Fluid Volume, deficient [isotonic] may be related to excessive blood loss, possibly evidenced by hypotension, increased heart rate, decreased pulse volume and pressure, delayed capillary refill, or changes in sensorium.

Fear related to threat of death (perceived or actual) to fetus/self, possibly evidenced by verbalization of specific concerns, increased tension, sympathetic stimulation.

Pain, acute may be related to collection of blood between uterine wall and placenta, possibly evidenced by verbal reports, abdominal guarding, muscle tension, or alterations in vital signs.

Gas Exchange, impaired fetal may be related to altered uteroplacental oxygen transfer, possibly evidenced by alterations in fetal heart rate and movement.

abscess, brain (acute)

Pain acute may be related to inflammation, edema of tissues, possibly evidenced by reports of headache, restlessness, irritability, and moaning.

Hyperthermia, risk for: risk factors may include inflammatory process/hypermetabolic state and dehydration.

Confusion, acute may be related to physiologic changes (e.g., cerebral edema/altered perfusion, fever), possibly evidenced by fluctuation in cognition/level of consciousness, increased agitation/restlessness, hallucinations.

Suffocation/Trauma, risk for: risk factors may include development of clonic/tonic muscle activity and changes in consciousness (seizure activity).

abuse

Trauma, risk for: risk factors may include vulnerable client, recipient of verbal threats, history of physical abuse.

Powerlessness may be related to abusive relationship, lifestyle of helplessness as evidenced by verbal expressions of having no control, reluctance to express true feelings, apathy, passivity.
Self-Esteem, chronic low may be related to continual negative evaluation of self/capabilities, personal vulnerability, willingness to tolerate possible life-threatening domestic violence as evidenced by self-negative verbalization, evaluates self as unable to deal with events, rationalizes away/rejects positive feedback.

achalasia
Swallowing, impaired may be related to neuromuscular impairment, possibly evidenced by observed difficulty in swallowing or regurgitation.
Nutrition: Less than body requirements, imbalanced may be related to inability and/or reluctance to ingest adequate nutrients to meet metabolic demands/nutritional needs, possibly evidenced by reported/observed inadequate intake, weight loss, and pale conjunctiva and mucous membranes.
Pain, acute may be related to spasm of the lower esophageal sphincter, possibly evidenced by reports of substernal pressure, recurrent heartburn, or gastric fullness (gas pains).
Anxiety [specify level]/Fear may be related to recurrent pain, choking sensation, altered health status, possibly evidenced by verbalizations of distress, apprehension, restlessness, or insomnia.
Aspiration, risk for: risk factors may include regurgitation/spillover of esophageal contents.
Knowledge, deficient [Learning Need] regarding condition, prognosis, self-care, and treatment needs may be related to lack of familiarity with pathology and treatment of condition, possibly evidenced by requests for information, statement of concern, or development of preventable complications.

acidosis, metabolic
Refer to *diabetic ketoacidosis*.

acne
Skin Integrity, impaired may be related to inflammatory process as evidenced by disruptions of skin surface.
Body Image, disturbed may be related to change in visual appearance as evidenced by fear of rejection of others, focus on past appearance, negative feelings about body, change in social involvement.
Self-Esteem, situational low may be related to adolescence, negative perception of appearance as evidenced by self-negating verbalizations, expressions of helplessness.

acute respiratory distress syndrome (ARDS)
Airway Clearance, ineffective may be related to loss of ciliary action, increased amount and viscosity of secretions, and increased airway resistance, possibly evidenced by presence of dyspnea, changes in depth/rate of respiration, use of accessory muscles for breathing, wheezes/crackles, cough with or without sputum production.
Gas Exchange, impaired may be related to changes in pulmonary capillary permeability with edema formation, alveolar hypoventilation and collapse, with intrapulmonary shunting; possibly evidenced by tachypnea, use of accessory muscles, cyanosis, hypoxia per arterial blood gases (ABGs)/oximetry; anxiety and changes in mentation.
Fluid Volume, risk for deficient: risk factors may include active loss from diuretic use and restricted intake.
Cardiac Output, risk for decreased: risk factors may include alteration in preload (hypovolemia, vascular pooling, diuretic therapy, and increased intrathoracic pressure/use of ventilator/positive end-expiratory pressure, PEEP).
Anxiety [specify level]/Fear may be related to physiologic factors (effects of hypoxemia); situational crisis, change in health status/threat of death; possibly evidenced by increased tension, apprehension, restlessness, focus on self, and sympathetic stimulation.
Injury, risk for barotrauma: risk factors may include increased airway pressure associated with mechanical ventilation (PEEP).

Addison's disease
Fluid Volume, deficient [hypotonic] may be related to vomiting, diarrhea, increased renal losses, possibly evidenced by delayed capillary refill, poor skin turgor, dry mucous membranes, report of thirst.

Cardiac Output, decreased may be related to hypovolemia and altered electrical conduction (dysrhythmias) and/or diminished cardiac muscle mass, possibly evidenced by alterations in vital signs, changes in mentation, and irregular pulse or pulse deficit.
Fatigue may be related to decreased metabolic energy production, altered body chemistry (fluid, electrolyte, and glucose imbalance), possibly evidenced by unremitting overwhelming lack of energy, inability to maintain usual routines, decreased performance, impaired ability to concentrate, lethargy, and disinterest in surroundings.
Body Image, disturbed may be related to changes in skin pigmentation and mucous membranes, loss of axillary/pubic hair, possibly evidenced by verbalization of negative feelings about body and decreased social involvement.
Mobility, risk for impaired physical: risk factors may include neuromuscular impairment (muscle wasting/weakness) and dizziness/syncope.
Nutrition: less than body requirements, imbalanced may be related to glucocorticoid deficiency; abnormal fat, protein, and carbohydrate metabolism; nausea, vomiting, anorexia, possibly evidenced by weight loss, muscle wasting, abdominal cramps, diarrhea, and severe hypoglycemia.
Home Maintenance, risk for impaired: risk factors may include effects of disease process, impaired cognitive functioning, and inadequate support systems.

adenoidectomy
Anxiety [specify level]/Fear may be related to separation from supportive others, unfamiliar surroundings, and perceived threat of injury/abandonment, possibly evidenced by crying, apprehension, trembling, and sympathetic stimulation (pupil dilation, increased heart rate).
Airway Clearance, risk for ineffective: risk factors may include sedation, collection of secretions/blood in oropharynx, and vomiting.
Fluid Volume, risk for deficient: risk factors may include operative trauma to highly vascular site/hemorrhage.
Pain,acute may be related to physical trauma to oronasopharynx, presence of packing, possibly evidenced by restlessness, crying, and facial mask of pain.

adrenalectomy
Tissue Perfusion, ineffective (specify) may be related to hypovolemia and vascular pooling (vasodilation), possibly evidenced by diminished pulse, pallor/cyanosis, hypotension, and changes in mentation.
Infection, risk for: risk factors may include inadequate primary defenses (incision, traumatized tissues), suppressed inflammatory response, invasive procedures.
Knowledge, deficient [Learning Need] regarding condition, prognosis, self-care and treatment needs may be related to unfamiliarity with long-term therapy requirements, possibly evidenced by request for information and statement of concern/misconceptions.

adult respiratory distress syndrome (ARDS)
Refer to *acute respiratory distress syndrome*

affective disorder
Refer to *bipolar disorder* and *depressive disorders, major depression* .

AIDS (acquired immunodeficiency syndrome)
Infection, risk for progression to sepsis/onset of new opportunistic infection: risk factors may include depressed immune system, use of antimicrobial agents, inadequate primary defenses; broken skin, traumatized tissue; malnutrition, and chronic disease processes.
Fluid Volume, risk for deficient: risk factors may include excessive losses: copious diarrhea, profuse sweating, vomiting, hypermetabolic state or fever; and restricted intake (nausea, anorexia, lethargy).
Pain, acute/chronic may be related to tissue inflammation/destruction: infections, internal/external cutaneous lesions, rectal excoriation, malignancies, necrosis, peripheral neuropathies, myalgias, and arthralgias, possibly evidenced by verbal reports, self-focusing/narrowed focus, alteration in muscle tone, paresthesias, paralysis, guarding behaviors, changes in vital signs (acute), autonomic responses, and restlessness.
Nutrition: less than body requirements, imbalanced may be related to altered ability to ingest, digest, and/or absorb nutrients (nausea/vomiting, hyperactive gag reflex, intestinal disturbances); increased metabolic activity/nutritional needs (fever, infection), possibly evidenced by weight loss, decreased subcutaneous fat/muscle mass; lack of interest in food/aversion to eating, altered taste sensation; abdominal cramping, hyperactive bowel sounds, diarrhea, sore and inflamed buccal cavity.

Fatigue may be related to decreased metabolic energy production, increased energy requirements (hypermetabolic state), overwhelming psychological/emotional demands; altered body chemistry (side effects of medication, chemotherapy), possibly evidenced by unremitting/overwhelming lack of energy, inability to maintain usual routines, decreased performance; impaired ability to concentrate, lethargy/restlessness, and disinterest in surroundings.

Protection, ineffective may be related to chronic disease affecting immune and neurological systems, inadequate nutrition, drug therapies, possibly evidenced by deficient immunity, impaired healing, neurosensory alterations, maladaptive stress response, fatigue, anorexia, disorientation.

Social Isolation may be related to changes in physical appearance/mental status, state of wellness, perceptions of unacceptable social or sexual behavior/values, physical isolation, phobic fear of others (transmission of disease); possibly evidenced by expressed feelings of aloneness/rejection, absence of supportive significant other(s)—(SOs), and withdrawal from usual activities.

Thought Processes, disturbed/Confusion, chronic: may be related to physiologic changes (hypoxemia, central nervous system [CNS] infection by HIV, brain malignancies, and/or disseminated systemic opportunistic infection); altered drug metabolism/excretion, accumulation of toxic elements (renal failure, severe electrolyte imbalance, hepatic insufficiency), possibly evidenced by clinical evidence of organic impairment, altered attention span, distractibility, memory deficit, disorientation, cognitive dissonance, delusional thinking, impaired ability to make decisions/problem solve, inability to follow complex commands/mental tasks, loss of impulse control and altered personality.

aldosteronism, primary

Fluid Volume, deficient [isotonic] may be related to increased urinary losses, possibly evidenced by dry mucous membranes, poor skin turgor, dilute urine, excessive thirst, weight loss.

Mobility, impaired physical may be related to neuromuscular impairment, weakness, and pain, possibly evidenced by impaired coordination, decreased muscle strength, paralysis, and positive Chvostek's and Trousseau's signs.

Cardiac Output, risk for decreased: risk factors may include hypovolemia and altered electrical conduction/dysrhythmias.

allergy, latex

Allergy Response, latex may be related to absence of immune mechanism response possibly evidenced by contact dermatitis—erythemia, blisters; delayed hypersensitivity—eczema, irritation; hypersensitivity—generalized edema, wheezing/bronchospasm, hypotension, cardiac arrest.

Anxiety [specify level]/Fear may be related to threat of death possibly evidenced by expressed concerns, hypervigilance, restlessness, focus on self.

Adjustment, risk for impaired: risk factors may include health status requiring change in occupation.

Alzheimer's disease

(Also refer to *dementia, presenile/senile*)

Injury/Trauma, risk for: risk factors may include inability to recognize/identify danger in environment, disorientation, confusion, impaired judgment, weakness, muscular incoordination, balancing difficulties, and altered perception.

Confusion, chronic related to physiological changes (neuronal degeneration); possibly evidenced by inaccurate interpretation of/response to stimuli, progressive/long-standing cognitive impairment, short-term memory deficit, impaired socialization, altered personality, and clinical evidence of organic impairment.

Sensory/Perception, disturbed (specify) may be related to altered sensory reception, transmission, and/or integration (neurologic disease/deficit), socially restricted environment (homebound/institutionalized), sleep deprivation possibly evidenced by changes in usual response to stimuli, change in problem-solving abilities, exaggerated emotional responses (anxiety, paranoia, hallucinations), inability to tell position of body parts, diminished/altered sense of taste.

Sleep Pattern, disturbed may be related to sensory impairment, changes in activity patterns, psychological stress (neurologic impairment), possibly evidenced by wakefulness, disorientation (day/night reversal); increased aimless wandering, inability to identify need/time for sleeping, changes in behavior/performance, lethargy; dark circles under eyes and frequent yawning.

Health Maintenance, ineffective may be related to deterioration affecting ability in all areas including coordination/communication, cognitive impairment, ineffective coping, possibly evidenced by reported or observed inability to take responsibility for meeting basic health practices, lack of equipment/financial or other resources, and impairment of personal support system.

Coping, Compromised Family/Caregiver Role Strain may be related to family disorganization, role changes, family/caregiver isolation, long-term illness/complexity and amount of homecare needs exhausting supportive/financial capabilities of family member(s), lack of respite; possibly evidenced by verbalizations of frustrations in dealing with day-to-day care, reports of conflict, feelings of depression, expressed anger/guilt directed toward patient, and withdrawal from interaction with patient/social contacts.

Relocation Stress Syndrome, risk for: risk factors may include little or no preparation for transfer to a new setting, changes in daily routine, sensory impairment, physical deterioration, separation from support systems.

amputation

Tissue Perfusion, risk for ineffective: peripheral: risk factors may include reduced arterial/venous blood flow; tissue edema, hematoma formation; hypovolemia.

Pain, acute may be related to tissue and nerve trauma, psychological impact of loss of body part, possibly evidenced by reports of incisional/phantom pain, guarding/protective behavior, narrowed/self-focus, and autonomic responses.

Mobility, impaired physical may be related to loss of limb (primarily lower extremity), altered sense of balance, pain/discomfort, possibly evidenced by reluctance to attempt movement, impaired coordination; decreased muscle strength, control, and mass.

Body Image, disturbed may be related to loss of a body part, possibly evidenced by verbalization of feelings of powerlessness, grief, preoccupation with loss, and unwillingness to look at/touch stump.

amyotrophic lateral sclerosis (ALS)

Mobility, impaired physical may be related to muscle wasting/weakness, possibly evidenced by impaired coordination, limited range of motion, and impaired purposeful movement.

Breathing Pattern, ineffective/ Ventilation, impaired spontaneous may be related to neuromuscular impairment, decreased energy, fatigue, tracheobronchial obstruction, possibly evidenced by shortness of breath, fremitus, respiratory depth changes, and reduced vital capacity.

Swallowing, impaired may be related to muscle wasting and fatigue, possibly evidenced by recurrent coughing/choking and signs of aspiration.

Powerlessness [specify level] may be related to chronic/debilitating nature of illness, lack of control over outcome, possibly evidenced by expressions of frustration about inability to care for self and depression over physical deterioration.

Grieving, anticipatory may be related to perceived potential loss of self/physiopsychosocial well-being, possibly evidenced by sorrow, choked feelings, expression of distress, changes in eating habits/sleeping patterns, and altered communication patterns/libido.

Communication, impaired verbal may be related to physical barrier (neuromuscular impairment), possibly evidenced by impaired articulation, inability to speak in sentences, and use of nonverbal cues (changes in facial expression).

Caregiver Role Strain, risk for: risk factors may include illness severity of care receiver, complexity and amount of home-care needs, duration of caregiving required, caregiver is spouse, family/caregiver isolation, lack of respite/recreation for caregiver.

anemia

Activity Intolerance may be related to imbalance between oxygen supply (delivery) and demand, possibly evidenced by reports of fatigue and weakness, abnormal heart rate or blood pressure (BP) response, decreased exercise/activity level, and exertional discomfort or dyspnea.

Nutrition: less than body requirements, imbalanced may be related to failure to ingest/inability to digest food or absorb nutrients necessary for formation of normal red blood cells (RBCs); possibly evidenced by weight loss/weight below normal for age, height, body build; decreased triceps skinfold measurement, changes in gums/oral mucous membranes; decreased tolerance for activity, weakness, and loss of muscle tone.

Knowledge, deficient [Learning Need] regarding condition, prognosis, self-care and treatment needs may be related to inadequate understanding or misinterpretation of dietary/physiologic needs, possibly evidenced by inadequate dietary intake, request for information, and development of preventable complications.

anemia, sickle cell

Gas Exchange, impaired may be related to decreased oxygen-carrying capacity of blood, reduced RBC life span, abnormal RBC structure, increased blood viscosity, predisposition to bacterial pneumonia/pulmonary infarcts, possibly evidenced by dyspnea, use of accessory muscles, cyanosis/signs of hypoxia, tachycardia, changes in mentation, and restlessness.

Tissue Perfusion, ineffective: (specify) may be related to stasis, vaso-occlusive nature of sickling, inflammatory response, atrioventricular (AV) shunts in pulmonary and peripheral circulation, myocardial damage (small infarcts, iron deposits, fibrosis), possibly evidenced by signs and symptoms dependent on system involved, for example, renal: decreased specific gravity and pale urine in face of dehydration; cerebral: paralysis and visual disturbances; peripheral: distal ischemia, tissue infarctions, ulcerations, bone pain; cardiopulmonary: angina, palpitations.

Pain, acute/chronic may be related to intravascular sickling with localized vascular stasis, occlusion, infarction/necrosis, deprivation of oxygen and nutrients, accumulation of noxious metabolites, possibly evidenced by reports of localized, generalized, or migratory joint and/or abdominal/back pain; guarding and distraction behaviors (moaning, crying, restlessness), facial grimacing, narrowed focus, and autonomic responses.

Knowledge, deficient [Learning Need] regarding disease process, genetic factors, prognosis, self-care and treatment needs may be related to lack of exposure/recall, misinterpretation of information, unfamiliarity with resources, possibly evidenced by questions, statement of concern/misconceptions, exacerbation of condition, inadequate follow-through of therapy instructions, and development of preventable complications.

Growth and Development, delayed may be related to effects of physical condition, possibly evidenced by altered physical growth and delay/difficulty performing skills typical of age group.

Coping, compromised family may be related to chronic nature of disease/disability, family disorganization, presence of other crises/situations impacting significant person/parent, lifestyle restrictions, possibly evidenced by significant person/parent expressing preoccupation with own reaction and displaying protective behavior disproportionate to patient's ability or need for autonomy.

angina pectoris

Pain, acute may be related to decreased myocardial blood flow, increased cardiac workload/oxygen consumption, possibly evidenced by verbal reports, narrowed focus, distraction behaviors (restlessness, moaning), and autonomic responses (diaphoresis, changes in vital signs).

Cardiac Output, decreased may be related to inotropic changes (transient/prolonged myocardial ischemia, effects of medications), alterations in rate/rhythm and electrical conduction, possibly evidenced by changes in hemodynamic readings, dyspnea, restlessness, decreased tolerance for activity, fatigue, diminished peripheral pulses, cool/pale skin, changes in mental status, and continued chest pain.

Anxiety [specify level] may be related to situational crises, change in health status and/or threat of death, negative self-talk possibly evidenced by verbalized apprehension, facial tension, extraneous movements, and focus on self.

Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by exertional dyspnea, abnormal pulse/BP response to activity, and electrocardiogram (ECG) changes.

Knowledge, deficient [Learning Need] regarding condition, prognosis, self-care, and treatment needs may be related to lack of exposure, inaccurate/misinterpretation of information, possibly evidenced by questions, request for information, statement of concern, and inaccurate follow-through of instructions.

Adjustment, risk for impaired: risk factors may include condition requiring long-term therapy/change in lifestyle, assault to self-concept, and altered locus of control.

anorexia nervosa

Nutrition: less than body requirements, imbalanced may be related to psychological restrictions of food intake and/or excessive activity, self-induced vomiting, laxative abuse, possibly evidenced by weight loss, poor skin turgor/muscle tone, denial of hunger, unusual hoarding or handling of food, amenorrhea, electrolyte imbalance, cardiac irregularities, hypotension.

Fluid Volume, risk for deficient: risk factors may include inadequate intake of food and liquids, chronic/excessive laxative or diuretic use, self-induced vomiting.

Thought Processes, disturbed may be related to severe malnutrition/electrolyte imbalance, psychological conflicts; possibly evidenced by impaired ability to make decisions, problem-solve, non–reality-based verbalizations, ideas of reference, altered sleep pat-

terns, altered attention span/distractibility; perceptual disturbances with failure to recognize hunger, fatigue, anxiety, and depression.

Body Image, disturbed/Self-Esteem, chronic low may be related to altered perception of body, perceived loss of control in some aspect of life, unmet dependency needs, personal vulnerability, dysfunctional family system, possibly evidenced by negative feelings, distorted view of body, use of denial, feeling powerless to prevent/make changes, expressions of shame/guilt, overly conforming, dependent on others' opinions.

Family Processes, interrupted may be related to ambivalent family relationships and ways of transacting issues of control, situational/maturational crises possibly evidenced by enmeshed family, dissonance among family members, family developmental tasks not being met, family members acting as enablers.

anxiety disorder, generalized

Anxiety [specify level]/Powerlessness may be related to real or perceived threat to physical integrity or self-concept (may or may not be able to identify the threat), unconscious conflict about essential values/beliefs and goals of life, unmet needs, negative self-talk, possibly evidenced by sympathetic stimulation, extraneous movements (foot shuffling, hand/arm fidgeting, rocking movements, restlessness), persistent feelings of apprehension and uneasiness, a general anxious feeling that patient has difficulty alleviating, poor eye contact, focus on self, impaired functioning, free-floating anxiety, and nonparticipation in decision making.

Coping, ineffective may be related to level of anxiety being experienced by the patient, personal vulnerability; unmet expectations/unrealistic perceptions, inadequate coping methods and/or support systems possibly evidenced by verbalization of inability to cope/problem-solve, excessive compulsive behaviors (e.g. smoking, drinking), and emotional/muscle tension, alteration in societal participation, high rate of accidents.

Sleep Pattern, disturbed may be related to psychological stress, repetitive thoughts, possibly evidenced by reports of difficulty in falling asleep/awakening earlier or later than desired, reports of not feeling rested, dark circles under eyes, and frequent yawning.

Coping, risk for compromised family: risk factors may include inadequate/incorrect information or understanding by a primary person, temporary family disorganization and role changes, prolonged disability that exhausts the supportive capacity of significant other(s).

Social Interaction, impaired/Social Isolation may be related to low self-concept, inadequate personal resources, misinterpretation of internal/external stimuli, hypervigilance possibly evidenced by discomfort in social situations, withdrawal from or reported change in pattern of interactions, dysfunctional interactions; expressed feelings of difference from others; sad, dull affect.

aortic stenosis

Cardiac Output, decreased may be related to structural changes of heart valve, left ventricular outflow obstruction, alteration of afterload (increased left ventricular end-diastolic pressure and systemic vascular resistance—SVR), alteration in preload/increased atrial pressure and venous congestion, alteration in electrical conduction, possibly evidenced by fatigue, dyspnea, changes in vital signs/hemodynamic parameters, and syncope.

Gas Exchange, risk for impaired: risk factors may include alveolar-capillary membrane changes/congestion.

Pain, risk for acute: risk factors may include episodic ischemia of myocardial tissues and stretching of left atrium.

Activity Intolerance may be related to imbalance between oxygen supply and demand (decreased/fixed cardiac output), possibly evidenced by exertional dyspnea, reported fatigue/weakness, and abnormal blood pressure or ECG changes/dysrhythmias in response to activity.

appendicitis

Pain, acute may be related to distention of intestinal tissues by inflammation, possibly evidenced by verbal reports, guarding behavior, narrowed focus, and autonomic responses (diaphoresis, changes in vital signs).

Fluid Volume, risk for deficient: risk factors may include nausea, vomiting, anorexia, and hypermetabolic state.

Infection, risk for: risk factors may include release of pathogenic organisms into peritoneal cavity.

arrhythmia, cardiac

Refer to *dysrhythmia, cardiac*.

arthritis, juvenile rheumatoid
(also refer to *arthritis, rheumatoid*)
Development, risk for delayed: risk factors may include effects of physical disability and required therapy.
Social Isolation, risk for: risk factors may include delay in accomplishing developmental task, altered state of wellness, and changes in physical appearance.

arthritis, rheumatoid
Pain, acute/chronic may be related to accumulation of fluid/inflammatory process, degeneration of joint, and deformity, possibly evidenced by verbal reports, narrowed focus, guarding/protective behaviors, and physical and social withdrawal.
Mobility, impaired physical, may be related to musculoskeletal deformity, pain/discomfort, decreased muscle strength, possibly evidenced by limited range of motion, impaired coordination, reluctance to attempt movement, and decreased muscle strength/control and mass.
Self-Care Deficit [specify] may be related to musculoskeletal impairment, decreased strength/endurance and range of motion, pain on movement, possibly evidenced by inability to manage activities of daily living (ADLs).
Body Image, disturbed/Role Performance, ineffective may be related to change in body structure/function, impaired mobility/ability to perform usual tasks, focus on past strength/function/appearance, possibly evidenced by negative self-talk, feeling of helplessness, change in lifestyle/physical abilities, dependence on others for assistance, decreased social involvement.

arthroplasty
Infection, risk for: risk factors may include breach of primary defenses (surgical incision), stasis of body fluids at operative site, and altered inflammatory response.
Fluid Volume, risk for deficient: risk factors may include surgical procedure/trauma to vascular area.
Mobility, impaired physical may be related to decreased strength, pain, musculoskeletal changes, possibly evidenced by impaired coordination and reluctance to attempt movement.
Pain, acute may be related to tissue trauma, local edema, possibly evidenced by verbal reports, narrowed focus, guarded movement, and autonomic responses (diaphoresis, changes in vital signs).

arthroscopy
Knowledge, deficient [Learning Need] regarding procedure/outcomes and self-care needs may be related to unfamiliarity with information/resources, misinterpretations, possibly evidenced by questions and requests for information, misconceptions.

asthma
(also refer to *emphysema*)
Airway Clearance, ineffective may be related to increased production/retained pulmonary secretions, bronchospasm, decreased energy/fatigue, possibly evidenced by wheezing, difficulty breathing, changes in depth/rate of respirations, use of accessory muscles, and persistent ineffective cough with or without sputum production.
Gas Exchange, impaired may be related to altered delivery of inspired oxygen/air trapping, possibly evidenced by dyspnea, restlessness, reduced tolerance for activity, cyanosis, and changes in ABGs and vital signs.
Anxiety [specify level] may be related to perceived threat of death, possibly evidenced by apprehension, fearful expression, and extraneous movements.
Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by fatigue and exertional dyspnea.

athlete's foot
Skin Integrity, impaired may be related to fungal invasion, humidity, secretions, possibly evidenced by disruption of skin surface, reports of painful itching.
Infection, risk for spread: risk factors may include multiple breaks in skin, exposure to moist/warm environment.

autistic disorder
Social Interaction, impaired may be related to abnormal response to sensory input/inadequate sensory stimulation, organic brain dysfunction; delayed development of secure attachment/trust, lack of intuitive skills to comprehend and accurately respond to social cues, disturbance in self-concept, possibly evidenced by lack of responsiveness to others, lack of eye contact or facial responsiveness, treating persons as objects, lack

of awareness of feelings in others, indifference/aversion to comfort, affection, or physical contact; failure to develop cooperative social play and peer friendships in childhood.

Communication, impaired verbal may be related to inability to trust others, withdrawal into self, organic brain dysfunction, abnormal interpretation/response to and/or inadequate sensory stimulation, possibly evidenced by lack of interactive communication mode, no use of gestures or spoken language, absent or abnormal nonverbal communication; lack of eye contact or facial expression; peculiar patterns of speech (form, content, or speech production), and impaired ability to initiate or sustain conversation despite adequate speech.

Self-Mutilation, risk for: risk factors may include organic brain dysfunction, inability to trust others, disturbance in self-concept, inadequate sensory stimulation or abnormal response to sensory input (sensory overload); history of physical, emotional, or sexual abuse; and response to demands of therapy, realization of severity of condition.

Identity, disturbed personal may be related to organic brain dysfunction, lack of development of trust, fixation at presymbiotic phase of development, possibly evidenced by lack of awareness of the feelings or existence of others, increased anxiety resulting from physical contact with others, absent or impaired imitation of others, repeating what others say, persistent preoccupation with parts of objects, obsessive attachment to objects, marked distress over changes in environment; autocratic/ritualistic behaviors, self-touching, rocking, swaying.

Coping, compromised family/disabled family may be related to family members unable to express feelings; excessive guilt, anger, or blaming among family members regarding child's condition; ambivalent or dissonant family relationships, prolonged coping with problem exhausting supportive ability of family members, possibly evidenced by denial of existence or severity of disturbed behaviors, preoccupation with personal emotional reaction to situation, rationalization that problem will be outgrown, attempts to intervene with child are achieving increasingly ineffective results, family withdraws from or becomes overly protective of child.

battered child syndrome

Trauma, risk for: risk factors may include dependent position in relationship(s), vulnerability (e.g., congenital problems/chronic illness), history of previous abuse/neglect, lack/nonuse of support systems by caregiver(s).

interrupted Family Processes/impaired Parenting may be related to poor role model/identity, unrealistic expectations, presence of stressors, and lack of support, possibly evidenced by verbalization of negative feelings, inappropriate caretaking behaviors, and evidence of physical/psychological trauma to child.

Self-Esteem, chronic low may be related to deprivation and negative feedback of family members, personal vulnerability, feelings of abandonment, possibly evidenced by lack of eye contact, withdrawal from social contacts, discounting own needs, nonassertive/passive, indecisive, or overly conforming behaviors.

Post-Trauma Syndrome may be related to sustained/recurrent physical or emotional abuse; possibly evidenced by acting-out behavior, development of phobias, poor impulse control, and emotional numbness.

Coping, ineffective may be related to situational or maturational crisis, overwhelming threat to self, personal vulnerability, inadequate support systems, possibly evidenced by verbalized concern about ability to deal with current situation, chronic worry, anxiety, depression, poor self-esteem, inability to problem-solve, high illness rate, destructive behavior toward self/others.

benign prostatic hypertrophy

Urinary Retention [acute/chronic] may be related to mechanical obstruction (enlarged prostate), decompensation of detrusor musculature, inability of bladder to contract adequately, possibly evidenced by frequency, hesitancy, inability to empty bladder completely, incontinence/dribbling, bladder distention, residual urine.

Pain, acute may be related to mucosal irritation, bladder distention, colic, urinary infection, and radiation therapy, possibly evidenced by reports (bladder/rectal spasm), narrowed focus, altered muscle tone, grimacing, distraction behaviors, restlessness, and autonomic responses.

Fluid Volume, risk for deficient: risk factors may include postobstructive diuresis, endocrine/electrolyte imbalances.

Fear/Anxiety [specify level] may be related to change in health status (possibility of surgical procedure/malignancy); embarrassment/loss of dignity associated with genital exposure before, during, and after treatment, and concern about sexual ability, possibly evidenced by increased tension, apprehension, worry, expressed concerns regarding perceived changes, and fear of unspecified consequences.

bipolar disorder

Violence, risk for directed at others: risk factors may include irritability, impulsive behavior; delusional thinking; angry response when ideas are refuted or wishes denied; manic excitement, with possible indicators of threatening body language/verbalizations, increased motor activity, overt and aggressive acts; and hostility.

Nutrition: less than body requirements, imbalanced may be related to inadequate intake in relation to metabolic expenditures, possibly evidenced by body weight 20% or more below ideal weight, observed inadequate intake, inattention to mealtimes, and distraction from task of eating; laboratory evidence of nutritional deficits/imbalances.

Poisoning, risk for lithium toxicity: risk factors may include narrow therapeutic range of drug, patient's ability (or lack of) to follow through with medication regimen and monitoring, and denial of need for information/therapy.

Sleep Pattern, disturbed may be related to psychological stress, lack of recognition of fatigue/need to sleep, hyperactivity, possibly evidenced by denial of need to sleep, interrupted nighttime sleep, one or more nights without sleep, changes in behavior and performance, increasing irritability/restlessness, and dark circles under eyes.

Sensory/Perception, disturbed (specify) [overload] may be related to decrease in sensory threshold, endogenous chemical alteration, psychological stress, sleep deprivation, possibly evidenced by increased distractibility and agitation, anxiety, disorientation, poor concentration, auditory/visual hallucination, bizarre thinking, and motor incoordination.

Family Processes, interrupted may be related to situational crises (illness, economics, change in roles); euphoric mood and grandiose ideas/actions of patient, manipulative behavior and limit-testing, patient's refusal to accept responsibility for own actions, possibly evidenced by statements of difficulty coping with situation, lack of adaptation to change or not dealing constructively with illness; ineffective family decision-making process, failure to send and to receive clear messages, and inappropriate boundary maintenance.

borderline personality disorder

Violence, risk for directed at self/others/Self-Mutilation: risk factors may include use of projection as a major defense mechanism, pervasive problems with negative transference, feelings of guilt/need to "punish" self, distorted sense of self, inability to cope with increased psychological or physiological tension in a healthy manner.

Anxiety [severe to panic] may be related to unconscious conflicts (experience of extreme stress), perceived threat to self-concept, unmet needs, possibly evidenced by easy frustration and feelings of hurt, abuse of alcohol/other drugs, transient psychotic symptoms and performance of self-mutilating acts.

Self-Esteem, chronic low/ Identity, disturbed personal may be related to lack of positive feedback, unmet dependency needs, retarded ego development/fixation at an earlier level of development, possibly evidenced by difficulty identifying self or defining self-boundaries, feelings of depersonalization, extreme mood changes, lack of tolerance of rejection or being alone, unhappiness with self, striking out at others, performance of ritualistic self-damaging acts, and belief that punishing self is necessary.

Social Isolation may be related to immature interests, unaccepted social behavior, inadequate personal resources, and inability to engage in satisfying personal relationships, possibly evidenced by alternating clinging and distancing behaviors, difficulty meeting expectations of others, experiencing feelings of difference from others, expressing interests inappropriate to developmental age, and exhibiting behavior unaccepted by dominant cultural group.

brain tumor

Pain, acute may be related to pressure on brain tissues, possibly evidenced by reports of headache, facial mask of pain, narrowed focus, and autonomic responses (changes in vital signs).

Thought Processes, disturbed may be related to altered circulation to and/or destruction of brain tissue, possibly evidenced by memory loss, personality changes, impaired ability to make decisions/conceptualize, and inaccurate interpretation of environment.

Sensory/Perception, disturbed (specify) may be related to compression/displacement of brain tissue, disruption of neuronal conduction, possibly evidenced by changes in visual acuity, alterations in sense of balance/gait disturbance, and paresthesia.

Fluid Volume, risk for deficient: risk factors may include recurrent vomiting from irritation of vagal center in medulla, and decreased intake.

Self-Care Deficit [specify] may be related to sensory/neuromuscular impairment interfering with ability to perform tasks, possibly evidenced by unkempt/disheveled appearance, body odor, and verbalization/observation of inability to perform activities of daily living.

breast cancer
Anxiety [specify level] may be related to change in health status, threat of death, stress, interpersonal transmission possibly evidenced by expressed concerns, apprehension, uncertainty, focus on self, diminished productivity.
Knowledge, deficient [Learning Need] regarding diagnosis, prognosis, and treatment options may be related to lack of exposure/unfamiliarity with information resources, information misinterpretation, cognitive limitation/anxiety possibly evidenced by verbalizations, statements of misconceptions, inappropriate behaviors.
Body Image, risk for disturbed: risk factors may include significance of body part with regard to sexual perceptions.
Sexuality Pattern, risk for ineffective: risk factors may include health-related changes, medical treatments, concern about relationship with significant other.

bronchitis
Airway Clearance, ineffective may be related to excessive, thickened mucous secretions, possibly evidenced by presence of rhonchi, tachypnea, and ineffective cough.
Activity Intolerance [specific level] may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue, dyspnea, and abnormal vital sign response to activity.
Pain, acute may be related to localized inflammation, persistent cough, aching associated with fever, possibly evidenced by reports of discomfort, distraction behavior, and facial mask of pain.

bronchopneumonia
(also refer to *bronchitis*)
Airway Clearance, ineffective may be related to tracheal bronchial inflammation, edema formation, increased sputum production, pleuritic pain, decreased energy, fatigue, possibly evidenced by changes in rate/depth of respirations, abnormal breath sounds, use of accessory muscles, dyspnea, cyanosis, effective/ineffective cough—with or without sputum production.
Gas Exchange, impaired may be related to inflammatory process, collection of secretions affecting oxygen exchange across alveolar membrane, and hypoventilation, possibly evidenced by restlessness/changes in mentation, dyspnea, tachycardia, pallor, cyanosis, and ABGs/oximetry evidence of hypoxia.
Infection, risk for spread: risk factors may include decreased ciliary action, stasis of secretions, presence of existing infection.

bulimia nervosa
Dentition, impaired may be related to dietary habits, poor oral hygiene, chronic vomiting possibly evidenced by erosion of tooth enamel, multiple caries, abraded teeth.
Oral Mucous Membrane, impaired may be related to malnutrition or vitamin deficiency; poor oral hygiene; chronic vomiting possibly evidenced by sore, inflamed buccal mucosa; swollen salivary glands; ulcerations of mucosa; reports of constant sore mouth/throat.
Fluid Volume, risk for deficient: risk factors may include consistent self-induced vomiting, chronic/excessive laxative/diuretic use, esophageal erosion or tear (Mallory-Weiss syndrome).
Knowledge, deficient [Learning Need] regarding condition, prognosis, complication, treatment may be related to lack of exposure to/unfamiliarity with information about condition, learned maladaptive coping skills possibly evidenced by verbalization of misconception of relationship of current situation and behaviors, distortion of body image, bingeing and purging behaviors, verbalized need for information/desire to change behaviors.

burn (dependent on type, degree, and severity of the injury)
Fluid Volume, risk for deficient: risk factors may include loss of fluids through wounds, capillary damage and evaporation, hypermetabolic state, insufficient intake, hemorrhagic losses.
Airway Clearance, risk for ineffective: risk factors may include mucosal edema and loss of ciliary action (smoke inhalation), direct upper air-way injury by flame, steam, chemicals.
Infection, risk for: risk factors may include loss of protective dermal barrier, traumatized/necrotic tissue, decreased hemoglobin, suppressed inflammatory response, environmental exposure/invasive procedures.
Pain, acute/chronic may be related to destruction of/trauma to tissue and nerves, edema formation, and manipulation of impaired tissues, possibly evidenced by verbal reports,

narrowed focus, distraction and guarding behaviors, facial mask of pain, and autonomic responses (changes in vital signs).

Nutrition: risk for less than body requirements, imbalanced: risk factors may include hypermetabolic state in response to burn injury/stress, inadequate intake, protein catabolism.

Post-Trauma Syndrome may be related to life-threatening event, possibly evidenced by reexperiencing the event, repetitive dreams/nightmares, psychic/emotional numbness, and sleep disturbance.

Protection, ineffective may be related to extremes of age, inadequate nutrition, anemia, impaired immune system, possibly evidenced by impaired healing, deficient immunity, fatigue, anorexia.

Diversional Activity, deficient may be related to long-term hospitalization, frequent lengthy treatments, and physical limitations, possibly evidenced by expressions of boredom, restlessness, withdrawal, and requests for something to do.

Development, risk for delayed: risk factors may include effects of physical disability, separation from significant other(s), and environmental deficiencies.

bursitis

Pain, acute/chronic may be related to inflammation of affected joint, possibly evidenced by verbal reports, guarding behavior, and narrowed focus.

Mobility, impaired physical may be related to inflammation and swelling of joint, and pain, possibly evidenced by diminished range of motion, reluctance to attempt movement, and imposed restriction of movement by medical treatment.

calculus, urinary

Pain, acute may be related to increased frequency/force of ureteral contractions, tissue trauma and edema formation, possibly evidenced by reports of sudden, severe, colicky pains; guarding and distraction behaviors and autonomic responses.

Urinary Elimination, impaired may be related to stimulation of the bladder by calculi, renal or ureteral irritation, mechanical obstruction of urinary flow, inflammation possibly evidenced by urgency and frequency; oliguria (retention); hematuria.

Infection, risk for: risk factors may include stasis of urine.

Knowledge, deficient [Learning Need] regarding condition, prognosis, self-care, and treatment needs may be related to lack of exposure/recall and information misinterpretation, possibly evidenced by requests for information, statements of concern, and recurrence/development of preventable complications.

cancer

(also refer to *chemotherapy*)

Fear/Anxiety, death may be related to situational crises, threat to/change in health/socioeconomic status, role functioning, interaction patterns; threat of death, separation from family, interpersonal transmission of feelings, possibly evidenced by expressed concerns, feelings of inadequacy/helplessness, insomnia; increased tension, restlessness, focus on self, sympathetic stimulation.

Grieving, anticipatory may be related to potential loss of physiologic well-being (body part/function), perceived separation from significant other(s)/lifestyle (death), possibly evidenced by anger, sadness, withdrawal, choked feelings, changes in eating/sleep patterns, activity level, libido, and communication patterns.

Pain, acute/chronic may be related to the disease process (compression of nerve tissue, infiltration of nerves or their vascular supply, obstruction of a nerve pathway, inflammation), or side effects of therapeutic agents, possibly evidenced by verbal reports, self-focusing/narrowed focus, alteration in muscle tone, facial mask of pain, distraction/guarding behaviors, autonomic responses, and restlessness.

Fatigue may be related to decreased metabolic energy production, increased energy requirements (hypermetabolic state), overwhelming psychological/emotional demands, and altered body chemistry (side effects of medications, chemotherapy), possibly evidenced by unremitting/overwhelming lack of energy, inability to maintain usual routines, decreased performance, impaired ability to concentrate, lethargy/listlessness, and lack of interest in surroundings.

Home Maintenance, impaired may be related to debilitation, lack of resources, and/or inadequate support systems, possibly evidenced by verbalization of problem, request for assistance, and lack of necessary equipment or aids.

Coping, compromised family/disabled family may be related to chronic nature of disease and disability, ongoing treatment needs, parental supervision, and lifestyle restrictions, possibly evidenced by expression of denial/despair, depression, and protective behavior disproportionate to patient's abilities or need for autonomy.

Coping, readiness for enhanced family may be related to the fact that the individual's needs are being sufficiently gratified and adaptive tasks effectively addressed, enabling goals of self-actualization to surface, possibly evidenced by verbalizations of impact of crisis on own values, priorities, goals, or relationships.

cardiac surgery

Anxiety [specify level]/Fear may be related to change in health status and threat to self-concept/of death, possibly evidenced by sympathetic stimulation, increased tension, and apprehension.

Cardiac Output, risk for decreased: risk factors may include decreased preload (hypovolemia), depressed myocardial contractility, changes in SVR (afterload), and alterations in electrical conduction (dysrhythmias).

Fluid Volume, deficient [isotonic] may be related to intraoperative bleeding with inadequate blood replacement; bleeding related to insufficient heparin reversal, fibrinolysis, or platelet destruction; or volume depletion effects of intraoperative/postoperative diuretic therapy, possibly evidenced by increased pulse rate, decreased pulse volume/pressure, decreased urine output, hemoconcentration.

Gas Exchange, risk for impaired: risk factors may include alveolar-capillary membrane changes (atelectasis), intestinal edema, inadequate function or premature discontinuation of chest tubes, and diminished oxygen-carrying capacity of the blood.

Pain, acute/[Discomfort] may be related to tissue inflammation/trauma, edema formation, intraoperative nerve trauma, and myocardial ischemia, possibly evidenced by reports of incisional discomfort/pain in chest and donor site; paresthesia/pain in hand, arm, shoulder, anxiety, restlessness, irritability; distraction behaviors, and autonomic responses.

Skin/Tissue Integrity, impaired related to mechanical trauma (surgical incisions, puncture wounds) and edema evidenced by disruption of skin surface/tissues.

care, long-term

(also refer to *condition requiring/contributing to need for facility placement*)

Anxiety [specify level]/Fear may be related to change in health status, role functioning, interaction patterns, socioeconomic status, environment; unmet needs, recent life changes, and loss of friends/significant other(s), possibly evidenced by apprehension, restlessness, insomnia, repetitive questioning, pacing, purposeless activity, expressed concern regarding changes in life events, and focus on self.

Grieving, anticipatory may be related to perceived/actual or potential loss of physiopsychosocial well-being, personal possessions, and significant other(s); as well as cultural beliefs about aging/debilitation, possibly evidenced by denial of feelings, depression, sorrow, guilt; alterations in activity level, sleep patterns, eating habits, and libido.

Poisoning, risk for drug toxicity: risk factors may include effects of aging (reduced metabolism, impaired circulation, precarious physiologic balance, presence of multiple diseases/organ involvement), and use of multiple prescribed/OTC drugs.

Thought Processes, disturbed may be related to physiological changes of aging (loss of cells and brain atrophy, decreased blood supply); altered sensory input, pain, effects of medications, and psychological conflicts (disrupted life pattern), possibly evidenced by slower reaction times, memory loss, altered attention span, disorientation, inability to follow, altered sleep patterns, and personality changes.

Sleep Pattern, disturbed may be related to internal factors (illness, psychological stress, inactivity) and external factors (environmental changes, facility routines), possibly evidenced by reports of difficulty in falling asleep/not feeling rested, interrupted sleep/awakening earlier than desired; change in behavior/performance, increasing irritability, and listlessness.

Sexuality Patterns, risk for ineffective: risk factors may include biopsychosocial alteration of sexuality; interference in psychological/physical well-being, self-image, and lack of privacy/significant other.

Relocation Stress Syndrome, risk for: risk factors may include multiple losses, feeling of powerlessness, lack of/inappropriate use of support system, changes in psychosocial/physical health status.

carpal tunnel syndrome

Pain, acute/chronic may be related to pressure on median nerve, possibly evidenced by verbal reports, reluctance to use affected extremity, guarding behaviors, expressed fear of reinjury, altered ability to continue previous activities.

Mobility, impaired physical may be related to neuromuscular impairment and pain, possibly evidenced by decreased hand strength, weakness, limited range of motion, and reluctance to attempt movement.

Peripheral Neurovascular Dysfunction, risk for: risks include mechanical compression (e.g., brace, repetitive tasks/motions), immobilization.
Knowledge, deficient [Learning Need] regarding condition, prognosis and treatment/safety needs may be related to lack of exposure/recall, information misinterpretation, possibly evidenced by questions, statements of concern, request for information, inaccurate follow-through of instructions/development of preventable complications.

cast
(also refer to *fractures*)
risk for Peripheral Neurovascular Dysfunction: risk factors may include presence of fracture(s), mechanical compression (cast), tissue trauma, immobilization, vascular obstruction.
Skin Integrity, risk for impaired: risk factors may include pressure of cast, moisture/debris under cast, objects inserted under cast to relieve itching, and/or altered sensation/circulation.
Self-Care Deficit [specify] may be related to impaired ability to perform self-care tasks, possibly evidenced by statements of need for assistance and observed difficulty in performing activities of daily living.

cataract
Sensory/Perception, disturbed: visual may be related to altered sensory reception/status of sense organs, and therapeutically restricted environment (surgical procedure, patching), possibly evidenced by diminished acuity, visual distortions, and change in usual response to stimuli.
Trauma, risk for: risk factors may include poor vision, reduced hand/eye coordination.
Anxiety [specify level]/Fear may be related to alteration in visual acuity, threat of permanent loss of vision/independence, possibly evidenced by expressed concerns, apprehension, and feelings of uncertainty.
Knowledge, deficient [Learning Need] regarding ways of coping with altered abilities, therapy choices, lifestyle changes may be related to lack of exposure/recall, misinterpretation, or cognitive limitations, possibly evidenced by requests for information, statement of concern, inaccurate follow-through of instructions/development of preventable complications.

cat scratch disease
Pain, acute may be related to effects of circulating toxins (fever, headache, and lymphadenitis), possibly evidenced by verbal reports, guarding behavior, and autonomic response (changes in vital signs).
Hyperthermia may be related to inflammatory process, possibly evidenced by increased body temperature, flushed warm skin, tachypnea, and tachycardia.

cerebrovascular accident
Tissue Perfusion, ineffective: cerebral may be related to interruption of blood flow (occlusive disorder, hemorrhage, cerebral vasospasm/edema), possibly evidenced by altered level of consciousness, changes in vital signs, changes in motor/sensory responses, restlessness, memory loss; sensory, language, intellectual, and emotional deficits.
Mobility, impaired physical may be related to neuromuscular involvement (weakness, paresthesia, flaccid/hypotonic paralysis, spastic paralysis), perceptual/cognitive impairment, possibly evidenced by inability to purposefully move involved body parts/limited range of motion; impaired coordination, and/or decreased muscle strength/control.
Communication, impaired verbal [and/or written] may be related to impaired cerebral circulation, neuromuscular impairment, loss of facial/oral muscle tone and control; generalized weakness/fatigue, possibly evidenced by impaired articulation, does not/cannot speak (dysarthria); inability to modulate speech, find and/or name words, identify objects and/or inability to comprehend written/spoken language; inability to produce written communication.
Self-Care Deficit [specify] may be related to neuromuscular impairment, decreased strength/endurance, loss of muscle control/coordination, perceptual/cognitive impairment, pain/discomfort, and depression, possibly evidenced by stated/observed inability to perform ADLs, requests for assistance, disheveled appearance, and incontinence.
Swallowing, risk for impaired: risk factors may include muscle paralysis and perceptual impairment.
risk for unilateral Neglect: risk factors may include sensory loss of part of visual field with perceptual loss of corresponding body segment.

Home Maintenance, impaired may be related to condition of individual family member, insufficient finances/family organization or planning, unfamiliarity with resources, and inadequate support systems, possibly evidenced by members expressing difficulty in managing home in a comfortable manner/requesting assistance with home maintenance, disorderly surroundings, and overtaxed family members.
Self-Esteem situational low/Body Image, disturbed/Role performance, ineffective may be related to biophysical, psychosocial, and cognitive/perceptual changes, possibly evidenced by actual change in structure and/or function, change in usual patterns of responsibility/physical capacity to resume role; and verbal/nonverbal response to actual or perceived change.

cesarean birth, unplanned

Knowledge, deficient [Learning Need] regarding underlying procedure, pathophysiology, and self-care needs may be related to incomplete/inadequate information, possibly evidenced by request for information, verbalization of concerns/misconceptions and inappropriate/exaggerated behavior.
Anxiety [specify level] may be related to actual/perceived threat to mother/fetus, emotional threat to self-esteem, unmet needs/expectations, and interpersonal transmission, possibly evidenced by increased tension, apprehension, feelings of inadequacy, sympathetic stimulation, and narrowed focus, restlessness.
Self-Esteem, risk for situational low: risk factors may include perceived "failure" at life event.
Pain, acute, risk for: risk factors may include increased/prolonged contractions, psychological reaction.
Infection, risk for: risk factors may include invasive procedures, rupture of amniotic membranes, break in skin, decreased hemoglobin, exposure to pathogens.

chemotherapy

(also refer to *cancer*)
Fluid volume, risk for deficient: risk factors may include gastrointestinal losses (vomiting), interference with adequate intake (stomatitis/anorexia), losses through abnormal routes (indwelling tubes, wounds, fistulas), and hypermetabolic state.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest adequate nutrients (nausea, stomatitis, and fatigue), hypermetabolic state, possibly evidenced by weight loss (wasting), aversion to eating, reported altered taste sensation, sore, inflamed buccal cavity; diarrhea and/or constipation.
Oral Mucous Membrane, impaired may be related to side effects of therapeutic agents/radiation, dehydration, and malnutrition, possibly evidenced by ulcerations, leukoplakia, decreased salivation, and reports of pain.
disturbed Body Image may be related to anatomical/structural changes; loss of hair and weight, possibly evidenced by negative feelings about body, preoccupation with change, feelings of helplessness/hopelessness, and change in social involvement.
Protection, ineffective may be related to inadequate nutrition, drug therapy/radiation, abnormal blood profile, disease state (cancer), possibly evidenced by impaired healing, deficient immunity, anorexia, fatigue.

cholecystectomy

Pain, acute may be related to interruption in skin/tissue layers with mechanical closure (sutures/staples) and invasive procedures [including T-tube/nasogastric (NG) tube], possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Breathing Pattern, ineffective may be related to decreased lung expansion (pain and muscle weakness), decreased energy/fatigue, ineffective cough, possibly evidenced by fremitus, tachypnea, and decreased respiratory depth/vital capacity.
Fluid Volume, risk for deficient: risk factors may include vomiting/NG aspiration, medically restricted intake, altered coagulation.

cholelithiasis

Pain, acute may be related to inflammation and distortion of tissues, ductal spasm, possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Nutrition: less than body requirements, imbalanced may be related to inability to ingest/absorb adequate nutrients (food intolerance/pain, nausea/vomiting, anorexia), possibly evidenced by aversion to food/decreased intake and weight loss.
Knowledge, deficient [Learning Need] regarding pathophysiology, therapy choices, and self-care needs may be related to lack of information, misinterpretation, possibly evidenced by verbalization of concerns, questions, and recurrence of condition.

chronic obstructive pulmonary disease
Gas Exchange, impaired may be related to altered oxygen delivery (obstruction of airways by secretions/bronchospasm, air-trapping) and alveoli destruction, possibly evidenced by dyspnea, restlessness, confusion, abnormal ABG values, and reduced tolerance for activity.
Airway Clearance, ineffective may be related to bronchospasm, increased production of tenacious secretions, retained secretions, and decreased energy/fatigue, possibly evidenced by presence of wheezes, crackles, tachypnea, dyspnea, changes in depth of respirations, use of accessory muscles, cough (persistent), and chest x-ray findings.
Activity Intolerance may be related to imbalance between oxygen supply and demand, and generalized weakness, possibly evidenced by verbal reports of fatigue, exertional dyspnea, and abnormal vital sign response.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest adequate nutrients (dyspnea, fatigue, medication side effects, sputum production, anorexia), possibly evidenced by weight loss, reported altered taste sensation, decreased muscle mass/subcutaneous fat, poor muscle tone, and aversion to eating/lack of interest in food.
Infection, risk for: risk factors may include decreased ciliary action, stasis of secretions, and debilitated state/malnutrition.

circumcision
Knowledge, Deficient [Learning Need] regarding surgical procedure, prognosis, and treatment may be related to lack of exposure, misinterpretation, unfamiliarity with information resources possibly evidenced by request for information, verbalization of concern/misconceptions, inaccurate follow-through of instructions.
Pain, acute may be related to trauma to/edema of tender tissues possibly evidenced by crying, changes in sleep pattern, refusal to eat.
Urinary Elimination, impaired may be related to tissue injury/inflammation, or development of urethral fistula possibly evidenced by edema, difficulty voiding.
Injury, risk for [hemorrhage]: risk factors may include decreased clotting factors immediately after birth, previously undiagnosed problems with bleeding/clotting.
Infection, risk for: risk factors may include immature immune system, invasive procedure/tissue trauma, environmental exposure.

cirrhosis
(Also refer to *Substance dependence/abuse rehabilitation*; *hepatitis, acute viral*)
Nutrition: less than body requirements, imbalanced may be related to inability to ingest/absorb nutrients (anorexia, nausea, indigestion, early satiety), abnormal bowel function, impaired storage of vitamins, possibly evidenced by aversion to eating, observed lack of intake, muscle wasting, weight loss, and imbalances in nutritional studies.
Fluid Volume excess may be related to compromised regulatory mechanism (e.g., syndrome of inappropriate antidiuretic hormone—SIADH, decreased plasma proteins/malnutrition) and excess sodium/fluid intake, possibly evidenced by generalized or abdominal edema, weight gain, dyspnea, BP changes, positive hepatojugular reflex, change in mentation, altered electrolytes, changes in urine specific gravity, and pleural effusion.
Skin Integrity, risk for impaired: risk factors may include altered circulation/metabolic state, poor skin turgor, skeletal prominence, and presence of edema/ascites, accumulation of bile salts in skin.
Confusion, risk for acute: risk factors may include alcohol abuse, increased serum ammonia level, and inability of liver to detoxify certain enzymes/drugs.
Self-Esteem [specify]/Body Image disturbed may be related to biophysical changes/altered physical appearance, uncertainty of prognosis, changes in role function, personal vulnerability, self-destructive behavior (alcohol-induced disease), possibly evidenced by verbalization of changes in lifestyle, fear of rejection/reaction of others, negative feelings about body/abilities, and feelings of helplessness/hopelessness/powerlessness.
Injury, risk for hemorrhage: risk factors may include abnormal blood profile (altered clotting factors), portal hypertension/development of esophageal varices.

cocaine hydrochloride poisoning, acute
(Also refer to *substance dependence/abuse rehabilitation*)
Breathing Pattern, ineffective may be related to pharmacological effects on respiratory center of the brain, possibly evidenced by tachypnea, altered depth of respiration, shortness of breath, and abnormal ABGs.
Cardiac Output, risk for decreased: risk factors may include drug effect on myocardium (degree dependent on drug purity/quality used), alterations in electrical rate/rhythm/conduction, preexisting myocardiopathy.

Nutrition: less than body requirements, imbalanced may be related to anorexia, insufficient/inappropriate use of financial resources, possibly evidenced by reported inadequate intake, weight loss/less than normal weight gain; lack of interest in food, poor muscle tone, signs/laboratory evidence of vitamin deficiencies.
Infection, risk for: risk factors may include injection techniques, impurities of drugs; localized trauma/nasal septum damage, malnutrition, altered immune state.
Coping, ineffective may be related to personal vulnerability, negative role modeling, inadequate support systems; ineffective/inadequate coping skills with substitution of drug, possibly evidenced by use of harmful substance, despite evidence of undesirable consequences.
Sensory/Perception, disturbed (specify) may be related to exogenous chemical, altered sensory reception/transmission/integration (hallucination), altered status of sense organs, possibly evidenced by responding to internal stimuli from hallucinatory experiences, bizarre thinking, anxiety/panic changes in sensory acuity (sense of smell/taste).

coccidioidomycosis (San Joaquin/Valley Fever)
Pain, acute may be related to inflammation, possibly evidenced by verbal reports, distraction behaviors, and narrowed focus.
Fatigue may be related to decreased energy production; states of discomfort, possibly evidenced by reports of overwhelming lack of energy, inability to maintain usual routine, emotional lability/irritability, impaired ability to concentrate, and decreased endurance/libido.
Knowledge, deficient [Learning Need] regarding nature/course of disease, therapy and self-care needs may be related to lack of information, possibly evidenced by statements of concern and questions.

colitis, ulcerative
Diarrhea may be related to inflammation or malabsorption of the bowel, presence of toxins and/or segmental narrowing of the lumen, possibly evidenced by increased bowel sounds/peristalsis, urgency, frequent/watery stools (acute phase), changes in stool color, and abdominal pain/cramping.
Pain, acute/chronic may be related to inflammation of the intestines/hyperperistalsis and anal/rectal irritation, possibly evidenced by verbal reports, guarding/distraction behaviors.
Fluid Volume, risk for deficient: risk factors may include continued gastrointestinal losses (diarrhea, vomiting, capillary plasma loss), altered intake, hypermetabolic state.
Nutrition: less than body requirements, imbalanced may be related to altered intake/absorption of nutrients (medically restricted intake, fear that eating may cause diarrhea) and hypermetabolic state, possibly evidenced by weight loss, decreased subcutaneous fat/muscle mass, poor muscle tone, hyperactive bowel sounds, steatorrhea, pale conjunctiva and mucous membranes, and aversion to eating.
Coping, ineffective may be related to chronic nature and indefinite outcome of disease, multiple stressors (repeated over time), personal vulnerability, severe pain, inadequate sleep, lack of/ineffective support systems, possibly evidenced by verbalization of inability to cope, discouragement, anxiety; preoccupation with physical self, chronic worry, emotional tension; depression, and recurrent exacerbation of symptoms.
Powerlessness, risk for: risk factors may include unresolved dependency conflicts, feelings of insecurity/resentment, repression of anger and aggressive feelings, lacking a sense of control in stressful situations, sacrificing own wishes for others, and retreat from aggression or frustration.

colostomy
Skin Integrity, risk for impaired: risk factors may include absence of sphincter at stoma and chemical irritation from caustic bowel contents, reaction to product/removal of adhesive, and improperly fitting appliance.
Diarrhea/Constipation, risk for: risk factors may include interruption/alteration of normal bowel function (placement of ostomy), changes in dietary/fluid intake, and effects of medication.
Knowledge, deficient [Learning Need] regarding changes in physiologic function and self-care/treatment needs may be related to lack of exposure/recall, information misinterpretation, possibly evidenced by questions, statement of concern, and inaccurate follow-through of instruction/development of preventable complications.
Body Image, disturbed may be related to biophysical changes (presence of stoma; loss of control of bowel elimination) and psychosocial factors (altered body structure, disease process/associated treatment regimen, e.g., cancer, colitis), possibly evidenced by

verbalization of change in perception of self, negative feelings about body, fear of rejection/reaction of others, not touching/looking at stoma, and refusal to participate in care.
Social Interaction, impaired may be related to fear of embarrassing situation secondary to altered bowel control with loss of contents, odor, possibly evidenced by reduced participation and verbalized/observed discomfort in social situations.
Sexual Dysfunction, risk for: risk factors may include altered body structure/function, radical resection/treatment procedures, vulnerability/psychological concern about response of significant other(s), and disruption of sexual response pattern (e.g., erection difficulty).

coma, diabetic
Refer to *diabetic ketoacidosis*.

concussion of the brain
Pain, acute may be related to trauma to/edema of cerebral tissue, possibly evidenced by reports of headache, guarding/distraction behaviors, and narrowed focus.
Fluid Volume, risk for deficient: risk factors may include vomiting, decreased intake, and hypermetabolic state (fever).
Thought Processes, risk for disturbed: risk factors may include trauma to/edema of cerebral tissue.
Knowledge, deficient [Learning Need] regarding condition, treatment/safety needs, and potential complications may be related to lack of recall, misinterpretation, cognitive limitation, possibly evidenced by questions/statement of concerns, development of preventable complications.

Conn's syndrome
Refer to *aldosteronism, primary* .

constipation
Constipation may be related to weak abdominal musculature, gastrointestinal obstructive lesions, pain on defecation, diagnostic procedures, pregnancy, possibly evidenced by change in character/frequency of stools, feeling of abdominal/rectal fullness or pressure, changes in bowel sounds, abdominal distention.
Pain, acute may be related to abdominal fullness/pressure, straining to defecate, and trauma to delicate tissues, possibly evidenced by verbal reports, reluctance to defecate, and distraction behaviors.
Knowledge, deficient [Learning Need] regarding dietary needs, bowel function, and medication effect may be related to lack of information/misconceptions, possibly evidenced by development of problem and verbalization of concerns/questions.

coronary artery bypass surgery
Cardiac Output, risk for decreased: risk factors may include decreased myocardial contractility, diminished circulating volume (preload), alterations in electrical conduction, and increased SVR (afterload).
Pain, acute may be related to direct chest tissue/bone trauma, invasive tubes/lines, donor site incision, tissue inflammation/edema formation, intraoperative nerve trauma, possibly evidenced by verbal reports, autonomic responses (changes in vital signs), and distraction behaviors/restlessness, irritability.
Sensory/Perception, disturbed (specify) may be related to restricted environment (postoperative/acute), sleep deprivation, effects of medications, continuous environmental sounds/activities, and psychological stress of procedure, possibly evidenced by disorientation, alterations in behavior, exaggerated emotional responses, and visual/auditory distortions.
Role Performance, ineffective may be related to situational crises (dependency role)/recuperative process, uncertainty about future, possibly evidenced by delay/alteration in physical capacity to resume role, change in usual role or responsibility change in self/others' perception of role.

Crohn's disease
(also refer to *colitis, ulcerative*)
Nutrition: less than body requirements, imbalanced may be related to intestinal pain after eating; and decreased transit time through bowel, possibly evidenced by weight loss, aversion to eating, and observed lack of intake.
Diarrhea may be related to inflammation of small intestines, presence of toxins, particularly dietary intake, possibly evidenced by hyperactive bowel sounds, cramping, and frequent loose liquid stools.

Knowledge, deficient [Learning Need] regarding condition, nutritional needs, and prevention of recurrence may be related to insufficient information/misinterpretation, unfamiliarity with resources, possibly evidenced by statements of concern/questions, inaccurate follow-through of instructions, and development of preventable complications/exacerbation of condition.

croup

Airway Clearance, ineffective may be related to presence of thick, tenacious mucus and swelling/spasms of the epiglottis, possibly evidenced by harsh/brassy cough, tachypnea, use of accessory breathing muscles, and presence of wheezes.

Fluid Volume, deficient [isotonic] may be related to decreased ability/aversion to swallowing, presence of fever, and increased respiratory losses, possibly evidenced by dry mucous membranes, poor skin turgor, and scanty/concentrated urine.

croup, membranous

(also refer to *croup*)

Suffocation, risk for: risk factors may include inflammation of larynx with formation of false membrane.

Anxiety [specify level]/Fear may be related to change in environment, perceived threat to self (difficulty breathing), and transmission of anxiety of adults, possibly evidenced by restlessness, facial tension, glancing about, and sympathetic stimulation.

Cushing's syndrome

Fluid Volume, risk for excess: risk factors may include compromised regulatory mechanism (fluid/sodium retention).

Infection, risk for: risk factors may include immunosuppressed inflammatory response, skin and capillary fragility, and negative nitrogen balance.

Nutrition: less than body requirements, imbalanced may be related to inability to utilize nutrients (disturbance of carbohydrate metabolism), possibly evidenced by decreased muscle mass and increased resistance to insulin.

Self-Care Deficit [specify] may be related to muscle wasting, generalized weakness, fatigue, and demineralization of bones, possibly evidenced by statements of/observed inability to complete or perform ADLs.

Body Image disturbed may be related to change in structure/appearance (effects of disease process, drug therapy), possibly evidenced by negative feelings about body, feelings of helplessness, and changes in social involvement.

Sexual Dysfunction may be related to loss of libido, impotence, and cessation of menses, possibly evidenced by verbalization of concerns and/or dissatisfaction with and alteration in relationship with significant other.

Trauma, risk for fractures: risk factors may include increased protein breakdown, negative protein balance, demineralization of bones.

cystic fibrosis

Airway Clearance, ineffective may be related to excessive production of thick mucus and decreased ciliary action, possibly evidenced by abnormal breath sounds, ineffective cough, cyanosis, and altered respiratory rate/depth.

Infection, risk for: risk factors may include stasis of respiratory secretions and development of atelectasis.

Nutrition: less than body requirements, imbalanced may be related to impaired digestive process and absorption of nutrients, possibly evidenced by failure to gain weight, muscle wasting, and retarded physical growth.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition, medical management, and available community resources may be related to insufficient information/misconceptions, possibly evidenced by statements of concern, questions; inaccurate follow-through of instructions, development of preventable complications.

Coping, compromised famiy may be related to chronic nature of disease and disability, inadequate/incorrect information or understanding by a primary person, and possibly evidenced by significant person attempting assistive or supportive behaviors with less than satisfactory results, protective behavior disproportionate to patient's abilities or need for autonomy.

cystitis

Pain, acute may be related to inflammation and bladder spasms, possibly evidenced by verbal reports, distraction behaviors, and narrowed focus.

Urinary Elimination, impaired may be related to inflammation/irritation of bladder, possibly evidenced by frequency, nocturia, and dysuria.

Knowledge, deficient [Learning Need] regarding condition, treatment, and prevention of recurrence may be related to inadequate information/misconceptions, possibly evidenced by statements of concern and questions; recurrent infections.

cytomegalic inclusion disease
Refer to *herpes*.

dehiscence (abdominal)
Skin Integrity, impaired may be related to altered circulation, altered nutritional state (obesity/malnutrition), and physical stress on incision, possibly evidenced by poor/delayed wound healing and disruption of skin surface/wound closure.
Infection, risk for: risk factors may include inadequate primary defenses (separation of incision, traumatized intestines, environmental exposure).
Tissue Integrity, risk for impaired: risk factors may include exposure of abdominal contents to external environment.
Fear/Anxiety [severe] may be related to crises, perceived threat of death, possibly evidenced by fearfulness, restless behaviors, and sympathetic stimulation.
Knowledge, deficient [Learning Need] regarding condition/prognosis and treatment needs may be related to lack of information/recall and misinterpretation of information, possibly evidenced by development of preventable complication, requests for information, and statement of concern.

dehydration
Fluid volume, deficient [specify] may be related to etiology as defined by specific situation, possibly evidenced by dry mucous membranes, poor skin turgor, decreased pulse volume/pressure, and thirst.
Oral Mucous Membrane, risk for impaired: risk factors may include dehydration and decreased salivation.
Knowledge, deficient [Learning Need] regarding fluid needs may be related to lack of information/misinterpretation, possibly evidenced by questions, statement of concern, and inadequate follow-through of instructions/development of preventable complications.

delirium tremens (acute alcohol withdrawal)
Anxiety [severe/panic]/Fear may be related to cessation of alcohol intake/physiological withdrawal, threat to self-concept, perceived threat of death, possibly evidenced by increased tension, apprehension, fear of unspecified consequences; identifies object of fear.
Sensory/Perception, disturbed (specify) may be related to exogenous (alcohol consumption/sudden cessation)/endogenous (electrolyte imbalance, elevated ammonia and blood urea nitrogen—BUN) chemical alterations, sleep deprivation, and psychological stress, possibly evidenced by disorientation, restlessness, irritability, exaggerated emotional responses, bizarre thinking and visual and auditory distortions/hallucinations.
Cardiac Output, risk for decreased: risk factors may include direct effect of alcohol on heart muscle, altered SVR, presence of dysrhythmias.
Trauma, risk for: risk factors may include alterations in balance, reduced muscle coordination, cognitive impairment, and involuntary clonic/tonic muscle activity.
Nutrition: less than body requirements, imbalanced may be related to poor dietary intake, effects of alcohol on organs involved in digestion, interference with absorption/metabolism of nutrients and amino acids, possibly evidenced by reports of inadequate food intake, altered taste sensation, lack of interest in food, debilitated state, decreased subcutaneous fat/muscle mass, signs of mineral/electrolyte deficiency, including abnormal laboratory findings.

dementia, presenile/senile
(also refer to *Alzheimer's disease*)
Memory, impaired may be related to neurological disturbances, possibly evidenced by observed experiences of forgetting, inability to determine if a behavior was performed, inability to perform previously learned skills, inability to recall factual information or recent/past events.
Fear may be related to decreases in functional abilities, public disclosure of disabilities, further mental/physical deterioration possibly evidenced by social isolation, apprehension, irritability, defensiveness, suspiciousness, aggressive behavior.
Self-Care Deficit [specify] may be related to cognitive decline, physical limitations, frustration over loss of independence, depression, possibly evidenced by impaired ability to perform ADLs.

Trauma, risk for: risk factors may include changes in muscle coordination/balance, impaired judgment, seizure activity.
Caregiver Role Strain, risk for: risk factors may include illness severity of care receiver, duration of caregiving required, care receiver exhibiting deviant/bizarre behavior; family/caregiver isolation, lack of respite/recreation, spouse is caregiver.

depressive disorders, major depression, dysthymia
Violence, risk for self-directed: risk factors may include depressed mood and feeling of worthlessness and hopelessness.
Anxiety [moderate to severe]/Thought Processes, disturbed may be related to psychological conflicts, unconscious conflict about essential values/goals of life, unmet needs, threat to self-concept, sleep deprivation, interpersonal transmission/contagion, possibly evidenced by reports of nervousness or fearfulness, feelings of inadequacy; agitation, angry/tearful outbursts, rambling/discoordinated speech, restlessness, hand rubbing or wringing, tremulousness; poor memory/concentration, decreased ability to grasp ideas, inability to follow/impaired ability to make decisions, numerous/repetitious physical complaints without organic cause, ideas of reference, hallucinations/delusions.
Sleep Pattern, disturbed may be related to biochemical alterations (decreased serotonin), unresolved fears and anxieties, and inactivity, possibly evidenced by difficulty in falling/remaining asleep, early morning awakening/awakening later than desired, reports of not feeling rested, and physical signs (e.g., dark circles under eyes, excessive yawning); hypersomnia (using sleep as an escape).
Social Isolation/Social Interaction, impaired may be related to alterations in mental status/thought processes (depressed mood), inadequate personal resources, decreased energy/inertia, difficulty engaging in satisfying personal relationships, feelings of worthlessness/low self-concept, inadequacy in or absence of significant purpose in life, and knowledge/skill deficit about social interactions, possibly evidenced by decreased involvement with others, expressed feelings of difference from others, remaining in home/room/bed, refusing invitations/suggestions of social involvement, and dysfunctional interaction with peers, family, and/or others.
Family Processes, interrupted may be related to situational crises of illness of family member with change in roles/responsibilities, developmental crises (e.g., loss of family member/relationship), possibly evidenced by statements of difficulty coping with situation, family system not meeting needs of its members, difficulty accepting or receiving help appropriately, ineffective family decision-making process, and failure to send and to receive clear messages.
Injury, risk for [effects of electroconvulsive therapy (ECT)] risk factors may include effects of therapy on the cardiovascular, respiratory, musculoskeletal, and nervous systems; and pharmacological effects of anesthesia.

dermatitis seborrheica
Skin Integrity, impaired may be related to chronic inflammatory condition of the skin, possibly evidenced by disruption of skin surface with dry or moist scales, yellowish crusts, erythema, and fissures.

diabetes mellitus
Knowledge, deficient [Learning Need] regarding disease process/treatment and individual care needs may be related to unfamiliarity with information/lack of recall, misinterpretation, possibly evidenced by requests for information, statements of concern/misconceptions, inadequate follow-through of instructions, and development of preventable complications.
Nutrition: less than body requirements, imbalanced may be related to inability to utilize nutrients (imbalance between intake and utilization of glucose) to meet metabolic needs, possibly evidenced by change in weight, muscle weakness, increased thirst/urination, and hyperglycemia.
Adjustment, risk for impaired: risk factors may include all-encompassing change in lifestyle, self-concept requiring lifelong adherence to therapeutic regimen and internal/altered locus of control.
Infection, risk for: risk factors may include decreased leukocytic function, circulatory changes, and delayed healing.
Sensory/Perception, risk for disturbed (specify): risk factors may include endogenous chemical alteration (glucose/insulin and/or electrolyte imbalance).
Coping, compromised family may be related to inadequate or incorrect information or understanding by primary person(s), other situational/developmental crises or situations the significant person(s) may be facing, lifelong condition requiring behavioral changes impacting family, possibly evidenced by family expressions of confusion about

what to do, verbalizations that they are having difficulty coping with situation; family does not meet physical/emotional needs of its members; significant other(s) preoccupied with personal reaction (e.g., guilt, fear), display protective behavior disproportionate (too little/too much) to patient's abilities or need for autonomy.

diabetic ketoacidosis

Fluid Volume, deficient [specify] may be related to hyperosmolar urinary losses, gastric losses, and inadequate intake, possibly evidenced by increased urinary output/dilute urine, reports of weakness, thirst; sudden weight loss, hypotension, tachycardia, delayed capillary refill, dry mucous membranes, poor skin turgor.

Nutrition: less than body requirements, imbalanced that may be related to inadequate utilization of nutrients (insulin deficiency), decreased oral intake, hypermetabolic state, possibly evidenced by recent weight loss, reports of weakness, lack of interest in food, gastric fullness/abdominal pain, and increased ketones, imbalance between glucose/insulin levels.

Fatigue may be related to decreased metabolic energy production, altered body chemistry (insufficient insulin), increased energy demands (hypermetabolic state/infection), possibly evidenced by overwhelming lack of energy, inability to maintain usual routines, decreased performance, impaired ability to concentrate, listlessness.

Infection, risk for: risk factors may include high glucose levels, decreased leukocyte function, stasis of body fluids, invasive procedures, alteration in circulation/perfusion.

dialysis, general

(also refer to *dialysis, peritoneal*; *hemodialysis*)

Nutrition: less than body requirements, imbalanced may be related to inadequate ingestion of nutrients (dietary restrictions, anorexia, nausea/vomiting, stomatitis), loss of peptides and amino acids (building blocks for proteins) during procedure, possibly evidenced by reported inadequate intake, aversion to eating, altered taste sensation, poor muscle tone/weakness, sore/inflamed buccal cavity, pale conjunctiva/mucous membranes.

Grieving, anticipatory may be related to actual or perceived loss, chronic and/or fatal illness, and thwarted grieving response to a loss, possibly evidenced by verbal expression of distress/unresolved issues, denial of loss; altered eating habits, sleep and dream patterns, activity levels, libido; crying, labile affect; feelings of sorrow, guilt, and anger.

Body Image, disturbed/Self-Esteem, situational low may be related to situational crisis and chronic illness with changes in usual roles/body image, possibly evidenced by verbalization of changes in lifestyle, focus on past function, negative feelings about body, feelings of helplessness/powerlessness, extension of body boundary to incorporate environmental objects (e.g., dialysis setup), change in social involvement, overdependence on others for care, not taking responsibility for self-care/lack of follow-through, and self-destructive behavior.

Self-Care Deficit [specify] may be related to perceptual/cognitive impairment (accumulated toxins); intolerance to activity, decreased strength and endurance; pain/discomfort, possibly evidenced by reported inability to perform ADLs, disheveled/unkempt appearance, strong body odor.

Powerlessness may be related to illness-related regimen and health care environment, possibly evidenced by verbal expression of having no control, depression over physical deterioration, nonparticipation in care, anger, and passivity.

Coping, compromised family/disabled family may be related to inadequate or incorrect information or understanding by a primary person, temporary family disorganization and role changes, patient providing little support in turn for the primary person, and prolonged disease/disability progression that exhausts the supportive capacity of significant persons, possibly evidenced by expressions of concern or reports about response of significant other(s)/family to patient's health problem, preoccupation of significant other(s) with own personal reactions, display of intolerance/rejection, and protective behavior disproportionate (too little or too much) to patient's abilities or need for autonomy.

dialysis, peritoneal

(also refer to *dialysis, general*)

Fluid Volume, risk for excess: risk factors may include inadequate osmotic gradient of dialysate, fluid retention (dialysate drainage problems/inappropriate osmotic gradient of solution, bowel distention), excessive PO/IV intake.

Trauma, risk for: risk factors may include improper placement during insertion or manipulation of catheter.

Pain, acute may be related to procedural factors (catheter irritation, improper catheter placement), presence of edema/abdominal distention, inflammation, or infection, rapid infusion/infusion of cold or acidic dialysate, possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.
Infection, risk for peritonitis: risk factors may include contamination of catheter/infusion system, skin contaminants, sterile peritonitis (response to composition of dialysate).
Breathing Pattern, risk for ineffective: risk factors may include increased abdominal pressure with restricted diaphragmatic excursion, rapid infusion of dialysate, pain/discomfort, inflammatory process (e.g., atelectasis/pneumonia).

diarrhea

Knowledge, deficient [Learning Need] regarding causative/contributing factors and therapeutic needs may be related to lack of information/misconceptions, possibly evidenced by statements of concern, questions, and development of preventable complications.
Fluid Volume, risk for deficient: risk factors may include excessive losses through gastrointestinal tract, altered intake.
Pain, acute may be related to abdominal cramping and irritation/excoriation of skin, possibly evidenced by verbal reports, facial grimacing, and autonomic responses.
Skin Integrity, impaired may be related to effects of excretions on delicate tissues, possibly evidenced by reports of discomfort and disruption of skin surface/destruction of skin layers.

digitalis poisoning

Cardiac Output, decreased may be related to altered myocardial contractility/electrical conduction, properties of digitalis (long half-life and narrow therapeutic range), concurrent medications, age/general health status and electrolyte/acid-base balance, possibly evidenced by changes in rate/rhythm/conduction (development/worsening of dysrhythmias), changes in mentation, worsening of heart failure, elevated serum drug levels.
Fluid Volume, risk for deficient/excess: risk factors may include excessive losses from vomiting/diarrhea, decreased intake/nausea, decreased plasma proteins, malnutrition, continued use of diuretics; excess sodium/fluid retention.
Knowledge, deficient [Learning Need] regarding condition/therapy and self-care needs may be related to information misinterpretation and lack of recall, possibly evidenced by inaccurate follow-through of instructions and development of preventable complications.
Thought Processes, risk for disturbed: risk factors may include physiologic effects of toxicity/reduced cerebral perfusion.

dilation and curettage (D and C)

(also refer to *abortion, spontaneous*)
Knowledge, deficient [Learning Need] regarding surgical procedure, possible postprocedural complications, and therapeutic needs may be related to lack of exposure/unfamiliarity with information, possibly evidenced by requests for information and statements of concern/misconceptions.

disseminated intravascular coagulation (DIC)

Fluid Volume, risk for deficient: risk factors may include failure of regulatory mechanism (coagulation process) and active loss/hemorrhage.
Tissue Perfusion, ineffective (specify) may be related to alteration of arterial/venous flow (microemboli throughout circulatory system and hypovolemia), possibly evidenced by changes in respiratory rate and depth, changes in mentation, decreased urinary output, and development of acral cyanosis/focal gangrene.
Gas Exchange, risk for impaired: risk factors may include reduced oxygen-carrying capacity, development of acidosis, fibrin deposition in microcirculation, and ischemic damage of lung parenchyma.
Pain, acute may be related to bleeding into joints/muscles, with hematoma formation, and ischemic tissues with areas of acral cyanosis/focal gangrene, possibly evidenced by verbal reports, narrowed focus, alteration in muscle tone, guarding/distraction behaviors, restlessness, autonomic responses.

dissociative disorders

Anxiety [severe/panic]/Fear may be related to maladaptation of ineffective coping continuing from early life, unconscious conflict(s), threat to self-concept, unmet needs, or phobic stimulus, possibly evidenced by maladaptive response to stress (e.g., dissoci-

ating self/fragmentation of the personality), increased tension, feelings of inadequacy, and focus on self, projection of personal perceptions onto the environment.
Violence, risk for directed at self/others: risk factors may include dissociative state/conflicting personalities, depressed mood, panic states, and suicidal/homicidal behaviors.
Identity, disturbed personal may be related to psychological conflicts (dissociative state), childhood trauma/abuse, threat to physical integrity/self-concept, and underdeveloped ego, possibly evidenced by alteration in perception or experience of self, loss of one's own sense of reality/the external world, poorly differentiated ego boundaries, confusion about sense of self, purpose or direction in life; memory loss, presence of more than one personality within the individual.
Coping, compromised family may be related to multiple stressors repeated over time, prolonged progression of disorder that exhausts the supportive capacity of significant person(s), family disorganization and role changes, high-risk family situation possibly evidenced by family/SOs describing inadequate understanding or knowledge that interferes with assistive or supportive behaviors; relationship/marital conflict.

diverticulitis
Pain, acute may be related to inflammation of intestinal mucosa, abdominal cramping, and presence of fever/chills, possibly evidenced by verbal reports, guarding/distraction behaviors, autonomic responses, and narrowed focus.
Diarrhea/Constipation may be related to altered structure/function and presence of inflammation, possibly evidenced by signs and symptoms dependent on specific problem (e.g., increase/decrease in frequency of stools and change in consistency).
Knowledge, deficient [Learning Need] regarding disease process, potential complications, therapeutic and self-care needs may be related to lack of information/misconceptions, possibly evidenced by statements of concern, request for information, and development of preventable complications.
Powerlessness, risk for: risk factors may include chronic nature of disease process with recurrent episodes despite cooperation with medical regimen.

Down syndrome
(also refer to *mental retardation*)
Growth and Development, delayed may be related to effects of physical/mental disability, possibly evidenced by altered physical growth; delay/inability in performing skills and self-care/self-control activities appropriate for age.
Trauma, risk for: risk factors may include cognitive difficulties and poor muscle tone/coordination, weakness.
Nutrition: less than body requirements, imbalanced may be related to poor muscle tone and protruding tongue, possibly evidenced by weak and ineffective sucking/swallowing and observed lack of adequate intake with weight loss/failure to gain.
Family Processes, interrupted may be related to situational/maturational crisis requiring incorporation of new skills into family dynamics, possibly evidenced by confusion about what to do, verbalized difficulty coping with situation, unexamined family myths.
Grieving, risk for dysfunctional: risk factors may include loss of "the perfect child," chronic condition requiring long-term care, and unresolved feelings.
Attachment, risk for impaired parent/infant/child: risk factors may include ill infant/child who is unable to effectively initiate parental contact due to altered behavioral organization, inability of parents to meet the personal needs.
Social Isolation, risk for: risk factors may include withdrawal from usual social interactions and activities, assumption of total child care, and becoming overindulgent/overprotective.

drug overdose, acute (depressants)
(Also refer to *substance dependence/abuse rehabilitation*)
Breathing Pattern, ineffective/Gas Exchange, impaired may be related to neuromuscular impairment/CNS depression, decreased lung expansion, possibly evidenced by changes in respirations, cyanosis, and abnormal ABGs.
Trauma/Suffocation/Poisoning, risk for: risk factors may include CNS depression/agitation, hypersensitivity to the drug(s), psychological stress.
Violence, risk for directed at self/others: risk factors may include suicidal behaviors, toxic reactions to drug(s).
Infection, risk for: risk factors may include drug injection techniques, impurities in injected drugs, localized trauma; malnutrition, altered immune state.

Duchenne's muscular dystrophy
Mobility, impaired physical may be related to musculoskeletal impairment/weakness, possibly evidenced by decreased muscle strength, control, and mass; limited range of motion; and impaired coordination.
Growth and Development, delayed may be related to effects of physical disability, possibly evidenced by altered physical growth and altered ability to perform self-care/self-control activities appropriate to age.
Nutrition: risk for more than body requirements, imbalanced: risk factors may include sedentary lifestyle and dysfunctional eating patterns.
Coping, compromised family may be related to situational crisis/emotional conflicts around issues about hereditary nature of condition and prolonged disease/disability that exhausts supportive capacity of family members, possibly evidenced by preoccupation with personal reactions regarding disability and displaying protective behavior disproportionate (too little/too much) to patient's abilities/need for autonomy.

dysmenorrhea
Pain, acute may be related to exaggerated uterine contractility, possibly evidenced by verbal reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).
Activity Intolerance, risk for: risk factors may include severity of pain and presence of secondary symptoms (nausea, vomiting, syncope, chills), depression.
Coping, ineffective may be related to chronic, recurrent nature of problem; anticipatory anxiety, and inadequate coping methods, possibly evidenced by muscular tension, headaches, general irritability, chronic depression, and verbalization of inability to cope, report of poor self-concept.

dysrhythmia, cardiac
Cardiac Output, risk for decreased: risk factors may include altered electrical conduction and reduced myocardial contractility.
Anxiety [specify level] may be related to perceived threat of death, possibly evidenced by increased tension, apprehension, and expressed concerns.
Knowledge, deficient [Learning Need] regarding medical condition/therapy needs may be related to lack of information/misinterpretation and unfamiliarity with information resources, possibly evidenced by questions, statement of misconception, failure to improve on previous regimen, and development of preventable complications.
Activity Intolerance, risk for: risk factors may include imbalance between myocardial oxygen supply and demand, and cardiac depressant effects of certain drugs (beta blockers, antidysrhythmics).
Poisoning, risk for digitalis toxicity: risk factors may include limited range of therapeutic effectiveness, lack of education/proper precautions, reduced vision/cognitive limitations.

eclampsia
Refer to *pregnancy-induced hypertension*.

ectopic pregnancy (tubal)
(Also refer to *abortion, spontaneous*)
Pain, acute may be related to distention/rupture of fallopian tube, possibly evidenced by reports, guarding/distraction behaviors, facial mask of pain, and autonomic responses (diaphoresis, changes in vital signs).
Fluid Volume, risk for deficient: risk factors may include hemorrhagic losses and decreased/restricted intake.
Anxiety [specify level]/Fear may be related to threat of death and possible loss of ability to conceive, possibly evidenced by increased tension, apprehension, sympathetic stimulation, restlessness, and focus on self.

eczema (dermatitis)
Pain [Discomfort] may be related to cutaneous inflammation and irritation, possibly evidenced by verbal reports, irritability, and scratching.
Infection, risk for: risk factors may include broken skin and tissue trauma.
Social Isolation may be related to alterations in physical appearance, possibly evidenced by expressed feelings of rejection and decreased interaction with peers.

edema, pulmonary
Fluid Volume excess may be related to decreased cardiac functioning, excessive fluid/sodium intake, possibly evidenced by dyspnea, presence of crackles (rales), pulmonary

congestion on x-ray, restlessness, anxiety, and increased central venous pressure (CVP)/pulmonary pressures.
Gas Exchange, impaired may be related to altered blood flow and decreased alveolar/capillary exchange (fluid collection/shifts into interstitial space/alveoli), possibly evidenced by hypoxia, restlessness, and confusion.
Anxiety [specify level]/Fear may be related to perceived threat of death (inability to breathe), possibly evidenced by responses ranging from apprehension to panic state, restlessness, and focus on self.

emphysema

Gas Exchange, impaired may be related to alveolar capillary membrane changes/destruction, possibly evidenced by dyspnea, restlessness, changes in mentation, abnormal ABG values.
Airway Clearance, ineffective may be related to increased production/retained tenacious secretions, decreased energy level, and muscle wasting, possibly evidenced by abnormal breath sounds (rhonchi), ineffective cough, changes in rate/depth of respirations, and dyspnea.
Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue/weakness, exertional dyspnea, and abnormal vital sign response to activity.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest food (shortness of breath, anorexia, generalized weakness, medication side effects), possibly evidenced by lack of interest in food, reported altered taste, loss of muscle mass and tone, fatigue, and weight loss.
Infection, risk for: risk factors may include inadequate primary defenses (stasis of body fluids, decreased ciliary action), chronic disease process, and malnutrition.
Powerlessness may be related to illness-related regimen and health care environment, possibly evidenced by verbal expression of having no control, depression over physical deterioration, nonparticipation in therapeutic regimen; anger, and passivity.

encephalitis

Tissue Perfusion, risk for ineffective: cerebral: risk factors may include cerebral edema altering/interrupting cerebral arterial/venous blood flow, hypovolemia, exchange problems at cellular level (acidosis).
Hyperthermia may be related to increased metabolic rate, illness, and dehydration, possibly evidenced by increased body temperature, flushed/warm skin, and increased pulse and respiratory rates.
Pain, acute may be related to inflammation/irritation of the brain and cerebral edema, possibly evidenced by verbal reports of headache, photophobia, distraction behaviors, restlessness, and autonomic response (changes in vital signs).
Trauma/Suffocation, risk for: risk factors may include restlessness, clonic/tonic activity, altered sensorium, cognitive impairment; generalized weakness, ataxia, vertigo.

endocarditis

Cardiac Output, risk for decreased: risk factors may include inflammation of lining of heart and structural change in valve leaflets.
Anxiety [specify level] may be related to change in health status and threat of death, possibly evidenced by apprehension, expressed concerns, and focus on self.
Pain, acute may be related to generalized inflammatory process and effects of embolic phenomena, possibly evidenced by reports, narrowed focus, distraction behaviors, and autonomic responses (changes in vital signs).
Activity Intolerance, risk for: risk factors may include imbalance between oxygen supply and demand, debilitating condition.
Tissue Perfusion, risk for ineffective (specify): risk factors may include embolic interruption of arterial flow (embolization of thrombi/valvular vegetations).

endometriosis

Pain, acute/chronic may be related to pressure of concealed bleeding/formation of adhesions, possibly evidenced by verbal reports (pain between/with menstruation), guarding/distraction behaviors, and narrowed focus.
Sexual Dysfunction may be related to pain secondary to presence of adhesions, possibly evidenced by verbalization of problem, and altered relationship with partner.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition and therapy needs may be related to lack of information/misinterpretations, possibly evidenced by statements of concern and misconceptions.

enteritis
Refer to *colitis, ulcerative*; *Crohn's disease*.

epididymitis
Pain, acute may be related to inflammation, edema formation, and tension on the spermatic cord, possibly evidenced by verbal reports, guarding/distraction behaviors (restlessness), and autonomic responses (changes in vital signs).
Infection, risk for spread: risk factors may include presence of inflammation/infectious process, insufficient knowledge to avoid spread of infection.
Knowledge, deficient [Learning Need] regarding pathophysiology, outcome, and self-care needs may be related to lack of information/misinterpretations, possibly evidenced by statements of concern, misconceptions, and questions.

epilepsy
Knowledge deficient [Learning Need] regarding condition and medication control may be related to lack of information/misinterpretations, scarce financial resources, possibly evidenced by questions, statements of concern/misconceptions, incorrect use of anticonvulsant medication, recurrent episodes/uncontrolled seizures.
Self-Esteem chronic low/Identity, disturbed personal may be related to perceived neurological functional change/weakness, perception of being out of control, stigma associated with condition, possibly evidenced by negative feelings about "brain"/self, change in social involvement, feelings of helplessness, and preoccupation with perceived change or loss.
Social Interaction, impaired may be related to unpredictable nature of condition and self-concept disturbance, possibly evidenced by decreased self-assurance, verbalization of concern, discomfort in social situations, inability to receive/communicate a satisfying sense of belonging/caring, and withdrawal from social contacts/activities.
Trauma/Suffocation, risk for: risk factors may include weakness, balancing difficulties, cognitive limitations/altered consciousness, loss of large- or small-scale muscle coordination (during seizure).

failure to thrive
Nutrition: less than body requirements, imbalanced may be related to inability to ingest/digest/absorb nutrients (defects in organ function/metabolism, genetic factors), physical deprivation/psychosocial factors), possibly evidenced by lack of appropriate weight gain/weight loss, poor muscle tone, pale conjunctiva, and laboratory tests reflecting nutritional deficiency.
Growth and Development, delayed may be related to inadequate caretaking (physical/emotional neglect or abuse); indifference, inconsistent responsiveness, multiple caretakers; environmental and stimulation deficiencies, possibly evidenced by altered physical growth, flat affect, listlessness, decreased response; delay or difficulty in performing skills or self-control activities appropriate for age group.
Parenting, risk for impaired: risk factors may include lack of knowledge, inadequate bonding, unrealistic expectations for self/infant, and lack of appropriate response of child to relationship.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition, nutritional needs, growth/development expectations, and parenting skills may be related to lack of information/misinformation or misinterpretation, possibly evidenced by verbalization of concerns, questions, misconceptions; and development of preventable complications.

fetal alcohol syndrome
Injury, risk for CNS damage: risk factors may include external chemical factors (alcohol intake by mother), placental insufficiency, fetal drug withdrawal in utero/postpartum and prematurity.
Infant Behavior, disorganized may be related to prematurity, environmental overstimulation, lack of containment/boundaries, possibly evidenced by change from baseline physiological measures; tremors, startles, twitches, hyperextension of arms/legs, deficient self-regulatory behaviors, deficient response to visual/auditory stimuli.
Parenting, risk for impaired: risk factors may include mental and/or physical illness, inability of mother to assume the overwhelming task of unselfish giving and nurturing, presence of stressors (financial/legal problems), lack of available or ineffective role model, interruption of bonding process, lack of appropriate response of child to relationship.
Coping, ineffective (mother) may be related to personal vulnerability, low self-esteem, inadequate coping skills, and multiple stressors (repeated over period of time), pos-

sibly evidenced by inability to meet basic needs/fulfill role expectations/problem solve, and excessive use of drug(s).

Family Processes: alcoholism, dysfunctional may be related to lack of/insufficient support from others, mother's drug problem and treatment status, together with poor coping skills, lack of family stability/overinvolvement of parents with children and multigenerational addictive behaviors, possibly evidenced by abandonment, rejection, neglectful relationships with family members, and decisions and actions by family that are detrimental.

fetal demise

Grieving [expected] may be related to death of fetus/infant (wanted or unwanted), possibly evidenced by verbal expression of distress, anger, loss; crying; alteration in eating habits or sleep pattern.

Self-Esteem, situational low may be related to perceived "failure" at a life event, possibly evidenced by negative self-appraisal in response to life event in a person with a previous positive self-evaluation, verbalization of negative feelings about the self (helplessness, uselessness), difficulty making decisions.

Spiritual Distress, risk for: risk factors may include loss of loved one, low self-esteem, poor relationships, challenged belief and value system (birth is supposed to be the beginning of life, not of death) and intense suffering.

fractures

(also refer to *casts*; *traction*)

Trauma, risk for additional injury: risk factors may include loss of skeletal integrity/movement of skeletal fragments, use of traction apparatus, and so on.

Pain, acute may be related to muscle spasms, movement of bone fragments, tissue trauma/edema, traction/immobility device, stress and anxiety, possibly evidenced by verbal reports, distraction behaviors, self-focusing/narrowed focus, facial mask of pain, guarding/protective behavior, alteration in muscle tone, and autonomic responses (changes in vital signs).

Peripheral Neurovascular Dysfunction, risk for: risk factors may include reduction/interruption of blood flow (direct vascular injury, tissue trauma, excessive edema, thrombus formation, hypovolemia).

Mobility, impaired physical may be related to neuromuscular/skeletal impairment, pain/discomfort, restrictive therapies (bedrest, extremity immobilization), and psychological immobility, possibly evidenced by inability to purposefully move within the physical environment, imposed restrictions, reluctance to attempt movement, limited range of motion, and decreased muscle strength/control.

Gas Exchange, risk for impaired: risk factors may include altered blood flow, blood/fat emboli, alveolar/capillary membrane changes (interstitial/pulmonary edema, congestion).

Knowledge, deficient [Learning Need] regarding healing process, therapy requirements, potential complications, and self-care needs may be related to lack of exposure, misinterpretation of information, possibly evidenced by statements of concern, questions, and misconceptions.

frostbite

Tissue Integrity, impaired may be related to altered circulation and thermal injury, possibly evidenced by damaged/destroyed tissue.

Pain, acute may be related to diminished circulation with tissue ischemia/necrosis and edema formation, possibly evidenced by reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).

Infection, risk for: risk factors may include traumatized tissue/tissue destruction, altered circulation, and compromised immune response in affected area.

gallstone

Refer to *cholelithiasis*.

gangrene, dry

Tissue Perfusion, ineffective: peripheral may be related to interruption in arterial flow, possibly evidenced by cool skin temperature, change in color (black), atrophy of affected part, and presence of pain.

Pain, acute may be related to tissue hypoxia and necrotic process, possibly evidenced by reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).

gas, lung irritant
Airway Clearance, ineffective may be related to irritation/inflammation of airway, possibly evidenced by marked cough, abnormal breath sounds (wheezes), dyspnea, and tachypnea.
Gas Exchange, risk for impaired: risk factors may include irritation/inflammation of alveolar membrane (dependent on type of agent and length of exposure).
Anxiety [specify level] may be related to change in health status and threat of death, possibly evidenced by verbalizations, increased tension, apprehension, and sympathetic stimulation.

gastritis, acute
Pain, acute may be related to irritation/inflammation of gastric mucosa, possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Fluid Volume, risk for deficient: risk factors may include excessive losses through vomiting and diarrhea, continued bleeding, reluctance to ingest/restrictions of oral intake.

gastritis, chronic
Nutrition: risk for less than body requirements, imbalanced: risk factors may include inability to ingest adequate nutrients (prolonged nausea/vomiting, anorexia, epigastric pain).
Knowledge, deficient [Learning Need] regarding pathophysiology, psychological factors, therapy needs, and potential complications may be related to lack of information/misinterpretation, possibly evidenced by verbalization of concerns, questions, misconceptions, and continuation of problem.

gastroenteritis
Refer to *gastritis, chronic; enteritis*.

gender identity disorder (For individuals experiencing persistent and marked distress regarding uncertainty about issues relating to personal identity, e.g., sexual orientation and behavior.)
Anxiety [specify level] may be related to unconscious/conscious conflicts about essential values/beliefs (ego-dystonic gender identification), threat to self-concept, unmet needs, possibly evidenced by increased tension, helplessness, hopelessness, feelings of inadequacy, uncertainty, insomnia, focus on self, and impaired daily functioning.
Role Performance, ineffective/Identity, disturbed personal may be related to crisis in development in which person has difficulty knowing/accepting to which sex he or she belongs or is attracted, sense of discomfort and inappropriateness about anatomic sex characteristics, possibly evidenced by confusion about sense of self, purpose or direction in life, sexual identification/preference, verbalization of desire to be/insistence that person is the opposite sex, change in self-perception of role, and conflict in roles.
Sexuality Patterns, ineffective may be related to ineffective or absent role models and conflict with sexual orientation and/or preferences, lack of/impaired relationship with significant other, possibly evidenced by verbalizations of discomfort with sexual orientation/role and lack of information about human sexuality.
Coping, risk for compromised family/disabled family: risk factors may include inadequate/incorrect information or understanding, significant other unable to perceive or to act effectively in regard to patient's needs, temporary family disorganization and role changes, and patient providing little support in turn for primary person.
Coping, readiness for enhanced family may be related to individual's basic needs being sufficiently gratified and adaptive tasks effectively addressed to enable goals of self-actualization to surface, possibly evidenced by family member(s)' attempts to describe growth/impact of crisis on own values, priorities, goals, or relationships; family member(s) is moving in direction of health-promoting and enriching lifestyle that supports patient's search for self; and choosing experiences that optimize wellness.

glaucoma
Sensory/Perception, disturbed: visual may be related to altered sensory reception and altered status of sense organ (increased intraocular pressure/atrophy of optic nerve head), possibly evidenced by progressive loss of visual field.
Anxiety [specify level] may be related to change in health status, presence of pain, possibility/reality of loss of vision, unmet needs, and negative self-talk, possibly evidenced by apprehension, uncertainty, and expressed concern regarding changes in life event.

glomerulonephritis
Fluid Volume excess may be related to failure of regulatory mechanism (inflammation of glomerular membrane inhibiting filtration), possibly evidenced by weight gain, edema/anasarca, intake greater than output, and blood pressure changes.
Pain, acute may be related to effects of circulating toxins and edema/distention of renal capsule, possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Nutrition: less than body requirements, imbalanced may be related to anorexia and dietary restrictions, possibly evidenced by aversion to eating, reported altered taste, weight loss, and decreased intake.
Diversional Activity, deficient may be related to treatment modality/restrictions, fatigue, and malaise, possibly evidenced by statements of boredom, restlessness, and irritability.
Growth, risk for disproportionate: risk factors may include infection, malnutrition, chronic illness.

gonorrhea
(also refer to *sexually transmitted disease—STD*)
Infection, risk for dissemination/bacteremia: risk factors may include presence of infectious process in highly vascular area and lack of recognition of disease process.
Pain, acute may be related to irritation/inflammation of mucosa and effects of circulating toxins, possibly evidenced by verbal reports of genital or pharyngeal irritation, perineal/pelvic pain, guarding/distraction behaviors.
Knowledge, deficient [Learning Need] regarding disease cause/transmission, therapy, and self-care needs may be related to lack of information/misinterpretation, denial of exposure, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions/development of preventable complications.

gout
Pain, acute may be related to inflammation of joint(s), possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Mobility, impaired physical may be related to joint pain/edema, possibly evidenced by reluctance to attempt movement, limited range of motion, and therapeutic restriction of movement.
Knowledge, deficient [Learning Need] regarding cause, treatment, and prevention of condition may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions.

Guillain-Barré syndrome (acute polyneuritis)
Breathing Pattern/Airway Clearance, risk for ineffective: risk factors may include weakness/paralysis of respiratory muscles, impaired gag/swallow reflexes, decreased energy/fatigue.
Sensory/Perception, disturbed (specify) may be related to altered sensory reception/transmission/integration (altered status of sense organs, sleep deprivation), therapeutically restricted environment, endogenous chemical alterations (electrolyte imbalance, hypoxia), and psychological stress, possibly evidenced by reported or observed change in usual response to stimuli, altered communication patterns, and measured change in sensory acuity and motor coordination.
Mobility, impaired physical may be related to neuromuscular impairment, pain/discomfort, possibly evidenced by impaired coordination, partial/complete paralysis, decreased muscle strength/control.
Anxiety [specify level]/Fear may be related to situational crisis, change in health status/threat of death, possibly evidenced by increased tension, restlessness, helplessness, apprehension, uncertainty, fearfulness, focus on self, and sympathetic stimulation.
Disuse Syndrome, risk for: risk factors include paralysis and pain.

hay fever
Pain [Discomfort] may be related to irritation/inflammation of upper airway mucous membranes and conjunctiva, possibly evidenced by verbal reports, irritability, and restlessness.
Knowledge, deficient [Learning Need] regarding underlying cause, appropriate therapy, and required lifestyle changes may be related to lack of information, possibly evidenced by statements of concern, questions, and misconceptions.

heart failure, congestive

Cardiac Output, decreased may be related to altered myocardial contractility/inotropic changes; alterations in rate, rhythm, and electrical conduction; and structural changes (valvular defects, ventricular aneurysm), possibly evidenced by tachycardia/dysrhythmias, changes in blood pressure, extra heart sounds, decreased urine output, diminished peripheral pulses, cool/ashen skin, orthopnea, crackles; dependent/generalized edema and chest pain.

Fluid Volume, excess may be related to reduced glomerular filtration rate/increased ADH production, and sodium/water retention, possibly evidenced by orthopnea and abnormal breath sounds, S_3 heart sound, jugular vein distention, positive hepatojugular reflex, weight gain, hypertension, oliguria, generalized edema.

Gas Exchange, risk for impaired risk factors may include alveolar-capillary membrane changes (fluid collection/shifts into interstitial space/alveoli).

Activity Intolerance may be related to imbalance between oxygen supply/demand, generalized weakness, and prolonged bedrest/sedentary lifestyle, possibly evidenced by reported/observed weakness, fatigue; changes in vital signs, presence of dysrhythmias; dyspnea, pallor, and diaphoresis.

Knowledge, Deficient [Learning Need] regarding cardiac function/disease process, therapy and self-care needs may be related to lack of information/misinterpretation, possibly evidenced by questions, statements of concern/misconceptions; development of preventable complications or exacerbations of condition.

heatstroke

Hyperthermia may be related to prolonged exposure to hot environment/vigorous activity with failure of regulating mechanism of the body, possibly evidenced by high body temperature (greater than 105°F/40.6°C), flushed/hot skin, tachycardia, and seizure activity.

Cardiac Output, decreased may be related to functional stress of hypermetabolic state, altered circulating volume/venous return, and direct myocardial damage secondary to hyperthermia, possibly evidenced by decreased peripheral pulses, dysrhythmias/tachycardia, and changes in mentation.

hemodialysis

(also refer to *dialysis, general*)

Injury, risk for loss of vascular access: risk factors may include clotting/thrombosis, infection, disconnection/hemorrhage.

Fluid Volume, risk for deficient: risk factors may include excessive fluid losses/shifts via ultrafiltration, hemorrhage (altered coagulation/disconnection of shunt), and fluid restrictions.

Fluid volume, risk for excess: risk factors may include excessive fluid intake; rapid IV, blood/plasma expanders/saline given to support BP during procedure.

Protection, ineffective may be related to chronic disease state, drug therapy, abnormal blood profile, inadequate nutrition, possibly evidenced by altered clotting, impaired healing, deficient immunity, fatigue, anorexia.

hemophilia

Fluid Volume, risk for deficient: risk factors may include impaired coagulation/hemorrhagic losses.

Pain, risk for acute/chronic: risk factors may include nerve compression from hematomas, nerve damage or hemorrhage into joint space.

Mobility, risk for impaired physical: risk factors may include joint hemorrhage, swelling, degenerative changes, and muscle atrophy.

Protection, ineffective may be related to abnormal blood profile, possibly evidenced by altered clotting.

Coping, compromised family may be related to prolonged nature of condition that exhausts the supportive capacity of significant person(s), possibly evidenced by protective behaviors disproportionate to patient's abilities/need for autonomy.

hemorrhoidectomy

Pain, acute may be related to edema/swelling and tissue trauma, possibly evidenced by verbal reports, guarding/distraction behaviors, focus on self, and autonomic responses (changes in vital signs).

Urinary Retention, risk for: risk factors may include perineal trauma, edema/swelling, and pain.

Knowledge, deficient [Learning Need] regarding therapeutic treatment and potential complications may be related to lack of information/misconceptions, possibly evidenced by statements of concern and questions.

hemorrhoids
Pain, acute may be related to inflammation and edema of prolapsed varices, possibly evidenced by verbal reports, and guarding/distraction behaviors.
Constipation may be related to pain on defecation and reluctance to defecate, possibly evidenced by frequency, less than usual pattern and hard, formed stools.

hemothorax
(also refer to *pneumothorax*)
Trauma/Suffocation, risk for: risk factors may include concurrent disease/injury process, dependence on external device (chest drainage system), and lack of safety education/precautions.
Anxiety [specify level] may be related to change in health status and threat of death, possibly evidenced by increased tension, restlessness, expressed concern, sympathetic stimulation, and focus on self.

hepatitis, acute viral
Fatigue may be related to decreased metabolic energy production and altered body chemistry, possibly evidenced by reports of lack of energy/inability to maintain usual routines, decreased performance, and increased physical complaints.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest adequate nutrients (nausea, vomiting, anorexia); hypermetabolic state, altered absorption and metabolism, possibly evidenced by aversion to eating/lack of interest in food, altered taste sensation, observed lack of intake, and weight loss.
Pain, acute/[Discomfort] may be related to inflammation and swelling of the liver, arthralgias, urticarial eruptions, and pruritus, possibly evidenced by verbal reports, guarding/distraction behaviors, focus on self, and autonomic responses (changes in vital signs).
Infection, risk for: risk factors may include inadequate secondary defenses and immunosuppression, malnutrition, insufficient knowledge to avoid exposure to pathogens/spread to others.
Skin/Tissue Integrity, risk for impaired: risk factors may include bile salt accumulation in the tissues.
Home Maintenance, risk for impaired: risk factors may include debilitating effects of disease process and inadequate support systems (family, financial, role model).
Knowledge, deficient [Learning Need] regarding disease process/transmission, treatment needs, and future expectations may be related to lack of information/recall, misinterpretation, unfamiliarity with resources, possibly evidenced by questions, statements of concerns/misconceptions, inaccurate follow-through of instructions, and development of preventable complications.

hernia, hiatal
Pain, chronic may be related to regurgitation of acidic gastric contents, possibly evidenced by verbal reports, facial grimacing, and focus on self.
Knowledge, deficient [Learning Need] regarding pathophysiology, prevention of complications and self-care needs may be related to lack of information/misconceptions, possibly evidenced by statements of concern, questions, and recurrence of condition.

herniation of nucleus pulposus (ruptured intervertebral disk)
Pain, acute/chronic may be related to nerve compression/irritation and muscle spasms, possibly evidenced by verbal reports, guarding/distraction behaviors, preoccupation with pain, self/narrowed focus, and autonomic responses (changes in vital signs when pain is acute), altered muscle tone/function, changes in eating/sleeping patterns and libido, physical/social withdrawal.
Mobility, impaired physical may be related to pain (muscle spasms), therapeutic restrictions (e.g., bedrest, traction/braces), muscular impairment, and depression, possibly evidenced by reports of pain on movement, reluctance to attempt/difficulty with purposeful movement, decreased muscle strength, impaired coordination, and limited range of motion.
Diversional Activity, deficient may be related to length of recuperation period and therapy restrictions, physical limitations, pain and depression, possibly evidenced by statements of boredom, disinterest, "nothing to do," and restlessness, irritability, withdrawal.

herpes, herpes simplex
Pain, acute may be related to presence of localized inflammation and open lesions, possibly evidenced by verbal reports, distraction behaviors, and restlessness.

Infection, risk for secondary: risk factors may include broken/traumatized tissue, altered immune response, and untreated infection/treatment failure.
Sexuality Patterns, risk for ineffective: risk factors may include lack of knowledge, values conflict, and/or fear of transmitting the disease.

herpes zoster (shingles)
Pain, acute may be related to inflammation/local lesions along sensory nerve(s), possibly evidenced by verbal reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).
Knowledge, deficient [Learning Need] regarding pathophysiology, therapeutic needs, and potential complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

HIV positive
(also refer to *AIDS*)
Adjustment, impaired may be related to life-threatening, stigmatizing condition/disease; assault to self-esteem, altered locus of control, inadequate support systems, incomplete grieving, medication side effects (fatigue/depression), possibly evidenced by verbalization of nonacceptance/denial of diagnosis, nonexistent or unsuccessful involvement in problem solving/goal setting; extended period of shock and disbelief or anger; lack of future-oriented thinking.
Knowledge, deficient [Learning Need] regarding disease, prognosis, and treatment needs may be related to lack of exposure/recall, information misinterpretation, unfamiliarity with information resources, or cognitive limitation, possibly evidenced by statements of misconception/request for information, inappropriate/exaggerated behaviors (hostile, agitated, hysterical, apathetic), inaccurate follow-through of instructions/development of preventable complications.

Hodgkin's disease
(also refer to *cancer*; *chemotherapy*)
Anxiety [specify level]/Fear may be related to threat to self-concept and threat of death, possibly evidenced by apprehension, insomnia, focus on self, and increased tension.
Knowledge, deficient [Learning Need] regarding diagnosis, pathophysiology, treatment, and prognosis may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.
Pain, acute/[Discomfort] may be related to manifestations of inflammatory response (fever, chills, night sweats) and pruritus, possibly evidenced by verbal reports, distraction behaviors, and focus on self.
Breathing Pattern/Airway Clearance, risk for ineffective: risk factors may include tracheobronchial obstruction (enlarged mediastinal nodes and/or airway edema).

hydrocephalus
Tissue Perfusion, ineffective: cerebral may be related to decreased arterial/venous blood flow (compression of brain tissue), possibly evidenced by changes in mentation, restlessness, irritability, reports of headache, pupillary changes, and changes in vital signs.
Sensory/Perception, disturbed: visual may be related to pressure on sensory/motor nerves, possibly evidenced by reports of double vision, development of strabismus, nystagmus, pupillary changes, and optic atrophy.
Mobility, risk for impaired physical: risk factors may include neuromuscular impairment, decreased muscle strength, and impaired coordination.
Adaptive Intracranial Capacity , risk for decreased: risk factors may include brain injury, changes in perfusion pressure/intracranial pressure.
Infection, risk for: risk factors may include invasive procedure/presence of shunt.
Knowledge, deficient [Learning Need] regarding condition, prognosis, and long-term therapy needs/medical follow-up may be related to lack of information/misperceptions, possibly evidenced by questions, statements of concern, request for information, and inaccurate follow-through of instruction/development of preventable complications.

hyperbilirubinemia
Injury, risk for CNS involvement: risk factors may include prematurity, hemolytic disease, asphyxia, acidosis, hyponatremia, and hypoglycemia.
Injury, risk for effects of treatment: risk factors may include physical properties of phototherapy and effects on body regulatory mechanisms, invasive procedure (exchange transfusion), abnormal blood profile, chemical imbalances.
Knowledge, deficient [Learning Need] regarding condition, prognosis, treatment/safety needs may be related to lack of exposure/recall and information misinterpretation,

possibly evidenced by questions, statement of concern, and inaccurate follow-through of instructions/development of preventable complications.

hyperemesis gravidarum
Fluid Volume, deficient [isotonic] may be related to excessive gastric losses and reduced intake, possibly evidenced by dry mucous membranes, decreased/concentrated urine, decreased pulse volume and pressure, thirst, and hemoconcentration.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest/digest/absorb nutrients (prolonged vomiting), possibly evidenced by reported inadequate food intake, lack of interest in food/aversion to eating, and weight loss.
Coping, risk for ineffective: risk factors may include situational/maturational crisis (pregnancy, change in health status, projected role changes, concern about outcome).

hypertension
Knowledge, deficient [Learning Need] regarding condition, therapeutic regimen, and potential complications may be related to lack of information/recall, misinterpretation, cognitive limitations, and/or denial of diagnosis, possibly evidenced by statements of concern/questions, and misconceptions, inaccurate follow-through of instructions, and lack of BP control.
Adjustment, impaired may be related to condition requiring change in lifestyle, altered locus of control, and absence of feelings/denial of illness, possibly evidenced by verbalization of nonacceptance of health status change and lack of movement toward independence.
Sexual Dysfunction, risk for: risk factors may include side effects of medication.
Cardiac Output, risk for decreased: risk factors may include increased afterload (vasoconstriction), fluid shifts/hypovolemia, myocardial ischemia, ventricular hypertrophy/rigidity.
Pain, acute may be related to increased cerebrovascular pressure, possibly evidenced by verbal reports (throbbing pain located in suboccipital region, present on awakening and disappearing spontaneously after being up and about), reluctance to move head, avoidance of bright lights and noise, or increased muscle tension.

hyperthyroidism
(also refer to *thyrotoxicosis*)
Fatigue may be related to hypermetabolic imbalance with increased energy requirements, irritability of CNS, and altered body chemistry, possibly evidenced by verbalization of overwhelming lack of energy to maintain usual routine, decreased performance, emotional lability/irritability, and impaired ability to concentrate.
Anxiety [specify level] may be related to increased stimulation of the CNS (hypermetabolic state, pseudocatecholamine effect of thyroid hormones), possibly evidenced by increased feelings of apprehension, overexcited/distressed, irritability/emotional lability, shakiness, restless movements, or tremors.
Nutrition: risk for less than body requirements, imbalanced: risk factors may include inability to ingest adequate nutrients for hypermetabolic rate/constant activity, impaired absorption of nutrients (vomiting/diarrhea), hyperglycemia/ relative insulin insufficiency.
Tissue Integrity, risk for impaired: risk factors may include altered protective mechanisms of eye related to periorbital edema, reduced ability to blink, eye discomfort/dryness, and development of corneal abrasion/ulceration.

hypoglycemia
Thought Processes, disturbed may be related to inadequate glucose for cellular brain function and effects of endogenous hormone activity, possibly evidenced by irritability, changes in mentation, memory loss, altered attention span, and emotional lability.
Nutrition: risk for less than body requirements, imbalanced: risk factors may include inadequate glucose metabolism and imbalance of glucose/insulin levels.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition and therapy/self-care needs may be related to lack of information/recall, misinterpretations, possibly evidenced by development of hypoglycemia and statements of questions/misconceptions.

hypoparathyroidism (acute)
Injury, risk for: risk factors may include neuromuscular excitability/tetany and formation of renal stones.
Pain, acute may be related to recurrent muscle spasms and alteration in reflexes, possibly evidenced by verbal reports, distraction behaviors, and narrowed focus.

Airway Clearance, risk for ineffective: risk factors may include spasm of the laryngeal muscles.
Anxiety [specify level] may be related to threat to, or change in, health status, physiological responses.

hypothermia (systemic)
(also refer to *frostbite*)
Hypothermia may be related to exposure to cold environment, inadequate clothing, age extremes (very young/elderly), damage to hypothalamus, consumption of alcohol/medications causing vasodilation, possibly evidenced by reduction in body temperature below normal range, shivering, cool skin, pallor.
Knowledge, deficient [Learning Need] regarding risk factors, treatment needs, and prognosis may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concerns/misconceptions, occurrence of problem, and development of complications.

hypothyroidism
(Also refer to *myxedema*)
Mobility, impaired physical may be related to weakness, fatigue, muscle aches, altered reflexes, and mucin deposits in joints and interstitial spaces, possibly evidenced by decreased muscle strength/control and impaired coordination.
Fatigue may be related to decreased metabolic energy production, possibly evidenced by verbalization of unremitting/overwhelming lack of energy, inability to maintain usual routines, impaired ability to concentrate, decreased libido, irritability, listlessness, decreased performance, increase in physical complaints.
Sensory/Perception, disturbed (specify) may be related to mucin deposits and nerve compression, possibly evidenced by paresthesias of hands and feet or decreased hearing.
Constipation may be related to decreased peristalsis/physical activity, possibly evidenced by frequency less than usual pattern, decreased bowel sounds, hard dry stools, and development of fecal impaction.

hysterectomy
Pain, acute may be related to tissue trauma/abdominal incision, edema/hematoma formation, possibly evidenced by verbal reports, guarding/distraction behaviors, and autonomic responses (changes in vital signs).
Urinary Elimination, impaired/Urinary Retention, [acute] risk for: risk factors may include mechanical trauma, surgical manipulation, presence of localized edema/hematoma, or nerve trauma with temporary bladder atony.
Sexuality Patterns, ineffective/Sexual Dysfunction, risk for: risk factors may include concerns regarding altered body function/structure, perceived changes in femininity, changes in hormone levels, loss of libido, and changes in sexual response pattern.

ileocolitis
Refer to *colitis, ulcerative*.

ileostomy
Refer to *colostomy*.

ileus
Pain, acute may be related to distention/edema and ischemia of intestinal tissue, possibly evidenced by verbal reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).
Diarrhea/Constipation may be related to presence of obstruction/changes in peristalsis, possibly evidenced by changes in frequency and consistency or absence of stool, alterations in bowel sounds, presence of pain, and cramping.
Fluid Volume, risk for deficient: risk factors may include increased intestinal losses (vomiting and diarrhea) and decreased intake.

impetigo
Skin Integrity, impaired may be related to presence of infectious process and pruritus, possibly evidenced by open/crusted lesions.
Pain, acute may be related to inflammation and pruritus, possibly evidenced by verbal reports, distraction behaviors, and self-focusing.
Infection, risk for secondary infection: risk factors may include broken skin, traumatized tissue, altered immune response, and virulence/contagious nature of causative organism.

Infection, risk for transmission: risk factors may include virulent nature of causative organism, insufficient knowledge to prevent infection of others.

influenza
Pain [Discomfort] may be related to inflammation and effects of circulating toxins, possibly evidenced by verbal reports, distraction behaviors, and narrowed focus.
Fluid Volume, risk for deficient: risk factors may include excessive gastric losses, hypermetabolic state, and altered intake.
Hyperthermia may be related to effects of circulating toxins and dehydration, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Breathing Pattern, risk for ineffective: risk factors may include response to infectious process, decreased energy/fatigue.

insulin shock
Refer to *hypoglycemia*.

intestinal obstruction
Refer to *ileus*.

Kawasaki disease
Hyperthermia may be related to increased metabolic rate and dehydration, possibly evidenced by increased body temperature greater than normal range, flushed skin, increased respiratory rate, and tachycardia.
Pain, acute may be related to inflammation and edema/swelling of tissues, possibly evidenced by verbal reports, restlessness, guarding behaviors, and narrowed focus.
Skin Integrity, impaired may be related to inflammatory process, altered circulation, and edema formation, possibly evidenced by disruption of skin surface including macular rash and desquamation.
Oral Mucous Membranes, impaired may be related to inflammatory process, dehydration, and mouth breathing, possibly evidenced by pain, hyperemia, and fissures of lips.
Cardiac Output, risk for decreased: risk factors may include structural changes/inflammation of coronary arteries and alterations in rate/rhythm or conduction.

labor, induced/augmented
Knowledge, deficient [Learning Need] regarding procedure, treatment needs, and possible outcomes may be related to lack of exposure/recall, information misinterpretation, and unfamiliarity with information resources, possibly evidenced by questions, statements of concern/misconception, and exaggerated behaviors.
Injury, risk for maternal risk factors may include adverse effects/response to therapeutic interventions.
Gas Exchange, risk for impaired fetal: risk factors may include altered placental perfusion/cord prolapse.
Pain, acute may be related to altered characteristics of chemically stimulated contractions, psychological concerns, possibly evidenced by verbal reports, increased muscle tone, distraction/guarding behaviors, and narrowed focus.

labor, preterm
Activity Intolerance may be related to muscle/cellular hypersensitivity, possibly evidenced by continued uterine contractions/irritability.
Poisoning, risk for: risk factors may include dose-related toxic/side effects of tocolytics.
Injury, risk for fetal: risk factors may include delivery of premature/immature infant.
Anxiety [specify level] may be related to situational crisis, perceived or actual threats to self/fetus and inadequate time to prepare for labor, possibly evidenced by increased tension, restlessness, expressions of concern, and autonomic responses (changes in vital signs).
Knowledge, deficient [Learning Need] regarding preterm labor treatment needs and prognosis may be related to lack of information and misinterpretation, possibly evidenced by questions, statements of concern, misconceptions, inaccurate follow-through of instruction, and development of preventable complications.

labor, stage I (active phase)
Pain, acute/[Discomfort] may be related to contraction-related hypoxia, dilation of tissues, and pressure on adjacent structures, combined with stimulation of both parasympathetic and sympathetic nerve endings, possibly evidenced by verbal reports, guarding/distraction behaviors (restlessness), muscle tension, and narrowed focus.

Urinary Elimination, impaired may be related to altered intake/dehydration, fluid shifts, hormonal changes, hemorrhage, severe intrapartal hypertension, mechanical compression of bladder, and effects of regional anesthesia, possibly evidenced by changes in amount/frequency of voiding, urinary retention, slowed progression of labor, and reduced sensation.
Coping, Individual/Couple, risk for ineffective: risk factors may include situational crises, personal vulnerability, use of ineffective coping mechanisms, inadequate support systems, and pain.

labor, stage II (expulsion)
Pain, acute may be related to strong uterine contractions, tissue stretching/dilation, and compression of nerves by presenting part of the fetus, and bladder distention, possibly evidenced by verbalizations, facial grimacing, guarding/distraction behaviors (restlessness), narrowed focus, and autonomic responses (diaphoresis).
Cardiac Output [fluctuation] may be related to changes in SVR, fluctuations in venous return (repeated/prolonged Valsalva's maneuvers, effects of anesthesia/medications, dorsal recumbent position occluding the inferior vena cava and partially obstructing the aorta), possibly evidenced by decreased venous return, changes in vital signs (BP, pulse), urinary output, or fetal bradycardia.
Gas Exchange, risk for impaired fetal: risk factors may include mechanical compression of head/cord, maternal position/prolonged labor affecting placental perfusion, and effects of maternal anesthesia, hyperventilation.
Skin/Tissue Integrity, risk for impaired: risk factors may include untoward stretching/lacerations of delicate tissues (precipitous labor, hypertonic contractile pattern, adolescence, large fetus) and application of forceps.
Fatigue, risk for: risk factors may include pregnancy, stress, anxiety, sleep deprivation, increased physical exertion, anemia, humidity/temperature, lights.

laminectomy (lumbar)
Tissue Perfusion, ineffective (specify): may be related to diminished/interrupted blood flow (dressing, edema/hematoma formation), hypovolemia, possibly evidenced by paresthesia, numbness; decreased range of motion, muscle strength.
Trauma, risk for spinal: risk factors may include temporary weakness of spinal column, balancing difficulties, changes in muscle tone/coordination.
Pain, acute may be related to traumatized tissues, localized inflammation, and edema, possibly evidenced by altered muscle tone, verbal reports, and distraction/guarding behaviors, autonomic changes.
Mobility, impaired physical may be related to imposed therapeutic restrictions, neuromuscular impairment, and pain, possibly evidenced by limited range of motion, decreased muscle strength/control, impaired coordination, and reluctance to attempt movement.
Urinary Retention, risk for [acute] risk factors may include pain and swelling in operative area and reduced mobility/restrictions of position.

laryngectomy
(also refer to *cancer*; *chemotherapy*)
Airway Clearance, ineffective may be related to partial/total removal of the glottis, temporary or permanent change to neck breathing, edema formation, and copious/thick secretions, possibly evidenced by dyspnea/difficulty breathing, changes in rate/depth of respiration, use of accessory respiratory muscles, weak/ineffective cough, abnormal breath sounds, and cyanosis.
Skin/Tissue Integrity, impaired may be related to surgical removal of tissues/grafting, effects of radiation or chemotherapeutic agents, altered circulation/reduced blood supply, compromised nutritional status, edema formation, and pooling/continuous drainage of secretions, possibly evidenced by disruption of skin/tissue surface and destruction of skin/tissue layers.
Oral Mucous Membrane, impaired may be related to dehydration/absence of oral intake, poor/inadequate oral hygiene, pathological condition (oral cancer), mechanical trauma (oral surgery), decreased saliva production, difficulty swallowing and pooling/drooling of secretions, and nutritional deficits, possibly evidenced by xerostomia (dry mouth), oral discomfort, thick/mucoid saliva, decreased saliva production, dry and crusted/coated tongue, inflamed lips, absent teeth/gums, poor dental health, and halitosis.
Communication, impaired verbal may be related to anatomic deficit (removal of vocal cords), physical barrier (tracheostomy tube), and required voice rest, possibly evidenced by inability to speak, change in vocal characteristics, and impaired articulation.

Aspiration, risk for: risk factors include impaired swallowing, facial/neck surgery, presence of tracheostomy/feeding tube.

laryngitis
Refer to *croup*.

lead poisoning, acute
(also refer to *lead poisoning, chronic*)
Trauma, risk for: risk factors may include loss of coordination, altered level of consciousness, clonic or tonic muscle activity, neurologic damage.
Fluid Volume, risk for deficient: risk factors may include excessive vomiting, diarrhea, or decreased intake.
Knowledge, deficient [Learning Need] regarding sources of lead and prevention of poisoning may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

lead poisoning, chronic
(also refer to *lead poisoning, acute*)
Nutrition: less than body requirements, imbalanced may be related to decreased intake (chemically induced changes in the gastrointestinal tract), possibly evidenced by anorexia, abdominal discomfort, reported metallic taste, and weight loss.
Thought Processes, disturbed may be related to deposition of lead in CNS and brain tissue, possibly evidenced by personality changes, learning disabilities, and impaired ability to conceptualize and reason.
Pain, chronic may be related to deposition of lead in soft tissues and bone, possibly evidenced by verbal reports, distraction behaviors, and focus on self.

leukemia, acute
(also refer to *chemotherapy*)
Infection, risk for: risk factors may include inadequate secondary defenses (alterations in mature white blood cells, increased number of immature lymphocytes, immunosuppression and bone marrow suppression), invasive procedures, and malnutrition.
Anxiety [specify level]/Fear may be related to change in health status, threat of death, and situational crisis, possibly evidenced by sympathetic stimulation, apprehension, feelings of helplessness, focus on self, and insomnia.
Activity Intolerance may be related to reduced energy stores, increased metabolic rate, imbalance between oxygen supply and demand, or therapeutic restrictions (bedrest)/effect of drug therapy, possibly evidenced by generalized weakness, reports of fatigue and exertional dyspnea; abnormal heart rate or BP response.
Pain, acute may be related to physical agents (infiltration of tissues/organs/CNS, expanding bone marrow) and chemical agents (antileukemic treatments), possibly evidenced by verbal reports (abdominal discomfort, arthralgia, bone pain, headache); distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).
Fluid Volume, risk for deficient: risk factors may include excessive losses (vomiting, hemorrhage, diarrhea), decreased intake (nausea, anorexia), increased fluid need (hypermetabolic state/fever), predisposition for kidney stone formation/tumor lysis syndrome.

long-term care
Refer to *care, long-term*.

lupus erythematosus, systemic (SLE)
Fatigue may be related to inadequate energy production/increased energy requirements (chronic inflammation), overwhelming psychological or emotional demands, states of discomfort, and altered body chemistry (including effects of drug therapy), possibly evidenced by reports of unremitting and overwhelming lack of energy/inability to maintain usual routines, decreased performance, lethargy, and decreased libido.
Pain, acute may be related to widespread inflammatory process affecting connective tissues, blood vessels, serosal surfaces, and mucous membranes, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Skin/Tissue integrity, impaired may be related to chronic inflammation, edema formation, and altered circulation, possibly evidenced by presence of skin rash/lesions, ulcerations of mucous membranes, and photosensitivity.
Body Image, disturbed may be related to presence of chronic condition with rash, lesions, ulcers, purpura, mottled erythema of hands, alopecia, loss of strength, and altered

body function, possibly evidenced by hiding body parts, negative feelings about body, feelings of helplessness, and change in social involvement.

Lyme disease
Pain, acute/chronic may be related to systemic effects of toxins, presence of rash, urticaria, and joint swelling/inflammation, possibly evidenced by verbal reports, guarding behavior, autonomic responses, and narrowed focus.
Fatigue may be related to increased energy requirements, altered body chemistry, and states of discomfort evidenced by reports of overwhelming lack of energy/inability to maintain usual routines, decreased performance, lethargy, and malaise.
Cardiac Output, risk for decreased risk factors may include alteration in rate/rhythm/conduction.

macular degeneration
Sensory Perception, disturbed: visual may be related to altered sensory reception possibly evidenced by reported/measured change in sensory acuity, change in usual response to stimuli.
Anxiety [specify level]/Fear may be related to situational crisis, threat to or change in health status and role function possibly evidenced by expressed concerns, apprehension, feelings of inadequacy, diminished productivity, impaired attention.
Home Maintenance, risk for impaired: risk factors may include impaired cognitive functioning, inadequate support systems.
Social Interaction, risk for impaired: risk factors may include limited physical mobility, environmental barriers.

Mallory-Weiss syndrome
(also refer to *achalasia*)
Fluid Volume, risk for deficient: risk factors may include excessive vascular losses, presence of vomiting, and reduced intake.
Knowledge, deficient [Learning Need] regarding causes, treatment, and prevention of condition may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and recurrence of problem.

mastectomy
Skin/Tissue Integrity, impaired may be related to surgical removal of skin/tissue, altered circulation, drainage, presence of edema, changes in skin elasticity/sensation, and tissue destruction (radiation), possibly evidenced by disruption of skin surface and destruction of skin layers/subcutaneous tissues.
Mobility, impaired physical may be related to neuromuscular impairment, pain, and edema formation, possibly evidenced by reluctance to attempt movement, limited range of motion, and decreased muscle mass/strength.
Self-Care deficit, bathing/dressing may be related to temporary loss/altered action of one or both arms, possibly evidenced by statements of inability to perform/complete self-care tasks.
Body Image, disturbed may be related to loss of body part denoting femininity, possibly evidenced by not looking at/touching area, negative feelings about body, preoccupation with loss, and change in social involvement/relationship.

mastitis
Pain, acute may be related to erythema and edema of breast tissues, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, autonomic responses (changes in vital signs).
Infection, risk for spread/abscess formation: risk factors may include traumatized tissues, stasis of fluids, and insufficient knowledge to prevent complications.
Knowledge, deficient [Learning Need] regarding pathophysiology, treatment, and prevention may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.
Breastfeeding, risk for ineffective: risk factors may include inability to feed on affected side/interruption in breastfeeding.

mastoidectomy
Infection, risk for spread: risk factors may include preexisting infection, surgical trauma, and stasis of body fluids in close proximity to brain.
Pain, acute may be related to inflammation, tissue trauma, and edema formation, possibly evidenced by verbal reports, distraction behaviors, restlessness, self-focusing, and autonomic responses (changes in vital signs).

Sensory/Perception, disturbed: auditory may be related to presence of surgical packing, edema, and surgical disturbance of middle ear structures, possibly evidenced by reported/tested hearing loss in affected ear.

measles

Pain, acute may be related to inflammation of mucous membranes, conjunctiva, and presence of extensive skin rash with pruritus, possibly evidenced by verbal reports, distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Hyperthermia may be related to presence of viral toxins and inflammatory response, possibly evidenced by increased body temperature, flushed/warm skin, and tachycardia.
Infection, risk for secondary: risk factors may include altered immune response and traumatized dermal tissues.
Knowledge, deficient [Learning Need] regarding condition, transmission, and possible complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and development of preventable complications.

meningitis, acute meningococcal

Infection, risk for spread: risk factors may include hematogenous dissemination of pathogen, stasis of body fluids, suppressed inflammatory response (medication-induced), and exposure of others to pathogens.
Tissue Perfusion, risk for ineffective: cerebral: risk factors may include cerebral edema altering/interrupting cerebral arterial/venous blood flow, hypovolemia, exchange problems at cellular level (acidosis).
Hyperthermia may be related to infectious process (increased metabolic rate) and dehydration, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Pain, acute may be related to inflammation/irritation of the meninges with spasm of extensor muscles (neck, shoulders, and back), possibly evidenced by verbal reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).
Trauma/Suffocation, risk for: risk factors may include alterations in level of consciousness, possible development of clonic/tonic muscle activity (seizures), and generalized weakness/prostration, ataxia, vertigo.

meniscectomy

Walking, impaired may be related to pain, joint instability, and imposed medical restrictions of movement, possibly evidenced by impaired ability to move about environment as needed/desired.
Knowledge, deficient [Learning Need] regarding postoperative expectations, prevention of complications, and self-care needs may be related to lack of information, possibly evidenced by statements of concern, questions, and misconceptions.

menopause

Thermoregulation, ineffective may be related to fluctuation of hormonal levels possibly evidenced by skin flushed/warm to touch, diaphoresis, night sweats; cold hands/feet.
Fatigue may be related to change in body chemistry, lack of sleep, depression possibly evidenced by reports of lack of energy, tired, inability to maintain usual routines, decreased performance.
Sexuality Patterns, risk for ineffective: risk factors may include perceived altered body function, changes in physical response, myths/inaccurate information, impaired relationship with significant other.
Urinary Incontinence, risk for stress: risk factors may include degenerative changes in pelvic muscles and structural support.
Health-Seeking Behaviors: management of life cycle changes may be related to maturational change possibly evidenced by expressed desire for increased control of health practice, demonstrated lack of knowledge in health promotion.

mental retardation

(also refer to *Down syndrome*)
Communication, impaired verbal may be related to developmental delay/impairment of cognitive and motor abilities, possibly evidenced by impaired articulation, difficulty with phonation, and inability to modulate speech/find appropriate words (dependent on degree of retardation).
Self-Care Deficit, risk for [specify] risk factors may include impaired cognitive ability and motor skills.

Nutrition: risk for more than body requirements, imbalanced: risk factors may include decreased metabolic rate coupled with impaired cognitive development, dysfunctional eating patterns, and sedentary activity level.
Social Interaction, impaired may be related to impaired thought processes, communication barriers, and knowledge/skill deficit about ways to enhance mutuality, possibly evidenced by dysfunctional interactions with peers, family, and/or significant other(s), and verbalized/observed discomfort in social situation.
Coping, compromised family may be related to chronic nature of condition and degree of disability that exhausts supportive capacity of significant other(s), other situational or developmental crises or situations the significant other may be facing, unrealistic expectations of significant other, possibly evidenced by preoccupation of significant other with personal reaction, significant other withdraws or enters into limited interaction with individual, protective behavior disproportionate (too much or too little) to patient's abilities or need for autonomy.
Home Maintenance, impaired may be related to impaired cognitive functioning, insufficient finances/family organization or planning, lack of knowledge, and inadequate support systems, possibly evidenced by requests for assistance, expression of difficulty in maintaining home, disorderly surroundings, and overtaxed family members.
Sexual Dysfunction, risk for: risk factors may include biopsychosocial alteration of sexuality, ineffectual/absent role models, misinformation/lack of knowledge, lack of significant other(s), and lack of appropriate behavior control.

mitral stenosis

Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue, weakness, exertional dyspnea, and tachycardia.
Gas Exchange, impaired may be related to altered blood flow, possibly evidenced by restlessness, hypoxia, and cyanosis (orthopnea/paroxysmal nocturnal dyspnea).
Cardiac Output, decreased may be related to impeded blood flow as evidenced by jugular vein distention, peripheral/dependent edema, orthopnea/paroxysmal nocturnal dyspnea.
Knowledge, deficient [Learning Need] regarding pathophysiology, therapeutic needs, and potential complications may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concern, questions, inaccurate follow-through of instructions, and development of preventable complications.

mononucleosis, infectious

Fatigue may be related to decreased energy production, states of discomfort, and increased energy requirements (inflammatory process), possibly evidenced by reports of overwhelming lack of energy, inability to maintain usual routines, lethargy, and malaise.
Pain [Discomfort] may be related to inflammation of lymphoid and organ tissues, irritation of oropharyngeal mucous membranes, and effects of circulating toxins, possibly evidenced by verbal reports, distraction behaviors, and self-focusing.
Hyperthermia may be related to inflammatory process, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Knowledge, deficient [Learning Need] regarding disease transmission, self-care needs, medical therapy, and potential complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, misconceptions, and inaccurate follow-through of instructions.

mood disorders

Refer to *depressive disorders*.

multiple personality

Refer to *dissociative disorders*.

multiple sclerosis

Fatigue may be related to decreased energy production/increased energy requirements to perform activities, psychological/emotional demands, pain/discomfort, medication side effects, possibly evidenced by verbalization of overwhelming lack of energy, inability to maintain usual routine, decreased performance, impaired ability to concentrate, increase in physical complaints.
Sensory/Perception, disturbed: visual, kinesthetic, tactile may be related to delayed/interrupted neuronal transmission, possibly evidenced by impaired vision, diplopia, disturbance of vibratory or position sense, paresthesias, numbness, and blunting of sensation.

Mobility, impaired physical may be related to neuromuscular impairment, discomfort/pain, sensoriperceptual impairments, decreased muscle strength, control and/or mass, deconditioning, as evidenced by limited ability to perform motor skills, limited range of motion, gait changes/postural instability.
Powerlessness/Hopelessness may be related to illness-related regimen and lifestyle of helplessness, possibly evidenced by verbal expressions of having no control or influence over the situation, depression over physical deterioration that occurs despite patient compliance with regimen, nonparticipation in care or decision making when opportunities are provided, passivity, decreased verbalization/affect.
Home Maintenance, impaired may be related to effects of debilitating disease, impaired cognitive and/or emotional functioning, insufficient finances, and inadequate support systems, possibly evidenced by reported difficulty, observed disorderly surroundings, and poor hygienic conditions.
Coping, compromised family/disabled family may be related to situational crises/temporary family disorganization and role changes, patient providing little support in turn for significant other(s), prolonged disease/disability progression that exhausts the supportive capacity of significant other(s), feelings of guilt, anxiety, hostility, despair, and highly ambivalent family relationships, possibly evidenced by patient expressing/confirming concern or report about significant other(s)' response to patient's illness, significant other(s) preoccupied with own personal reactions, intolerance, abandonment, neglectful care of the patient, and distortion of reality regarding patient's illness.

mumps

Pain, acute may be related to presence of inflammation, circulating toxins, and enlargement of salivary glands, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Hyperthermia may be related to inflammatory process (increased metabolic rate), and dehydration, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Fluid Volume, risk for deficient: risk factors may include hypermetabolic state and painful swallowing with decreased intake.

muscular dystrophy (Duchenne's)

(Refer to *Duchenne's muscular dystrophy*)

myasthenia gravis

Breathing Pattern/Airway Clearance, ineffective may be related to neuromuscular weakness and decreased energy/fatigue, possibly evidenced by dyspnea, changes in rate/depth of respiration, ineffective cough, and adventitious breath sounds.
Communication, impaired verbal may be related to neuromuscular weakness, fatigue, and physical barrier (intubation), possibly evidenced by facial weakness, impaired articulation, hoarseness, and inability to speak.
Swallowing, impaired may be related to neuromuscular impairment of laryngeal/pharyngeal muscles and muscular fatigue, possibly evidenced by reported/observed difficulty swallowing, coughing/choking, and evidence of aspiration.
Anxiety [specify level]/Fear may be related to situational crisis, threat to self-concept, change in health/socioeconomic status or role function, separation from support systems, lack of knowledge, and inability to communicate, possibly evidenced by expressed concerns, increased tension, restlessness, apprehension, sympathetic stimulation, crying, focus on self, uncooperative behavior, withdrawal, anger, and noncommunication.
Knowledge, deficient [Learning Need] regarding drug therapy, potential for crisis (myasthenic or cholinergic) and self-care management may be related to inadequate information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions; development of preventable complications.
Mobility, impaired physical may be related to neuromuscular impairment, possibly evidenced by reports of progressive fatigability with repetitive/prolonged muscle use, impaired coordination, and decreased muscle strength/control.
Sensory/Perception, disturbed: visual may be related to neuromuscular impairment, possibly evidenced by visual distortions (diplopia) and motor incoordination.

myocardial infarction

(also refer to *myocarditis*)

Pain, acute may be related to ischemia of myocardial tissue, possibly evidenced by verbal reports, guarding/distraction behaviors (restlessness), facial mask of pain, self-focusing, and autonomic responses (diaphoresis, changes in vital signs).

Anxiety [specify level]/Fear may be related to threat of death, threat of change of health status/role functioning and lifestyle, interpersonal transmission/contagion, possibly evidenced by increased tension, fearful attitude, apprehension, expressed concerns/uncertainty, restlessness, sympathetic stimulation, and somatic complaints.
Cardiac Output, risk for decreased: risk factors may include changes in rate and electrical conduction, reduced preload, increased systemic vascular resistance, and altered muscle contractility/depressant effects of some medications, infarcted/dyskinetic muscle, structural defects.

myocarditis
(Refer to *myocardial infarction*)
Activity Intolerance may be related to imbalance in oxygen supply and demand (myocardial inflammation/damage), cardiac depressant effects of certain drugs, and enforced bedrest, possibly evidenced by reports of fatigue, exertional dyspnea, tachycardia/palpitations in response to activity, ECG changes/dysrhythmias, and generalized weakness.
Cardiac Output, risk for decreased: risk factors may include degeneration of cardiac muscle.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition/outcomes, treatment, and self-care needs/lifestyle changes may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, misconceptions, inaccurate follow-through of instructions, and development of preventable complications.

myringotomy
Refer to *mastoidectomy*.

myxedema
(also refer to *hypothyroidism*)
Body Image, disturbed may be related to change in structure/function (loss of hair/thickening of skin, masklike facial expression, enlarged tongue, menstrual and reproductive disturbances), possibly evidenced by negative feelings about body, feelings of helplessness, and change in social involvement.
Nutrition: more than body requirements, imbalanced may be related to decreased metabolic rate and activity level, possibly evidenced by weight gain greater than ideal for height and frame.
Cardiac Output, risk for decreased: risk factors may include altered electrical conduction and myocardial contractility.

neonate, normal newborn
Gas Exchange, risk for impaired: risk factors may include prenatal or intrapartal stressors, excess production of mucus, or cold stress.
Body Temperature, risk for imbalanced: risk factors may include large body surface in relation to mass, limited amounts of insulating subcutaneous fat, nonrenewable sources of brown fat and few white fat stores, thin epidermis with close proximity of blood vessels to the skin, inability to shiver, and movement from a warm uterine environment to a much cooler environment.
Attachment, risk for impaired parent/infant/child: risk factors may include developmental transition (gain of a family member); anxiety associated with the parent role, or lack of privacy (intrusive family/visitors).
Nutrition: risk for less than body requirements, imbalanced: risk factors may include rapid metabolic rate, high caloric requirement, increased insensible water losses through pulmonary and cutaneous routes, fatigue, and a potential for inadequate or depleted glucose stores.
Infection, risk for: risk factors may include inadequate secondary defenses (inadequate acquired immunity, e.g., deficiency of neutrophils and specific immunoglobulins) and inadequate primary defenses (e.g., environmental exposure, broken skin, traumatized tissues, decreased ciliary action).

neonate, premature newborn
Gas Exchange, impaired may be related to alveolar-capillary membrane changes (inadequate surfactant levels), altered blood flow (immaturity of pulmonary arteriole musculature), altered oxygen supply (immaturity of central nervous system and neuromuscular system, tracheobronchial obstruction), altered oxygen-carrying capacity of blood (anemia), and cold stress, possibly evidenced by respiratory difficulties, inadequate oxygenation of tissues, and acidemia.

Breathing Pattern, ineffective may be related to immaturity of the respiratory center, poor positioning, drug-related depression, metabolic imbalances, or decreased energy/fatigue, possibly evidenced by dyspnea, tachypnea, periods of apnea, nasal flaring/use of accessory muscles, cyanosis, abnormal ABGs, and tachycardia.
Thermoregulation, risk for ineffective: risk factors may include immature CNS development (temperature regulation center), decreased ratio of body mass to surface area, decreased subcutaneous fat, limited brown fat stores, inability to shiver or sweat, poor metabolic reserves, muted response to hypothermia, and frequent medical/nursing manipulations and interventions.
Fluid Volume, risk for deficient: risk factors may include extremes of age and weight, excessive fluid losses (thin skin, lack of insulating fat, increased environmental temperature, immature kidney/failure to concentrate urine).
Infant Behavior, risk for disorganized: risk factors may include prematurity (immature central nervous system, hypoxia), lack of containment/boundaries, pain, or overstimulation, separation from parents.

nephrectomy
Pain, acute may be related to surgical tissue trauma with mechanical closure (suture), possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Fluid Volume, risk for deficient: risk factors may include excessive vascular losses and restricted intake.
Breathing Pattern, ineffective may be related to incisional pain with decreased lung expansion, possibly evidenced by tachypnea, fremitus, changes in respiratory depth/chest expansion, and changes in ABGs.
Constipation may be related to reduced dietary intake, decreased mobility, gastrointestinal obstructions (paralytic ileus), and incisional pain with defecation, possibly evidenced by decreased bowel sounds, reduced frequency/amount of stool, and hard/formed stool.

nephrotic syndrome
Fluid Volume, excess may be related to compromised regulatory mechanism with changes in hydrostatic/oncotic vascular pressure and increased activation of the renin-angiotensin-aldosterone system, possibly evidenced by edema/anasarca, effusions/ascites, weight gain, intake greater than output, and blood pressure changes.
Nutrition: less than body requirements, imbalanced may be related to excessive protein losses and inability to ingest adequate nutrients (anorexia), possibly evidenced by weight loss/muscle wasting (may be difficult to assess due to edema), lack of interest in food, and observed inadequate intake.
Infection, risk for: risk factors may include chronic disease and steroidal suppression of inflammatory responses.
Skin Integrity, risk for impaired: risk factors may include presence of edema and activity restrictions.

neuralgia, trigeminal
Pain, acute may be related to neuromuscular impairment with sudden violent muscle spasm, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Knowledge, deficient [Learning Need] regarding control of recurrent episodes, medical therapies, and self-care needs may be related to lack of information/recall and misinterpretation, possibly evidenced by statements of concern, questions, and exacerbation of condition.

neuritis
Pain, acute/chronic may be related to nerve damage usually associated with a degenerative process, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Knowledge, deficient [Learning Need] regarding underlying causative factors, treatment, and prevention may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

obesity
Nutrition: less than body requirements, imbalanced may be related to excessive intake in relation to metabolic needs, possibly evidenced by weight 20% greater than ideal for height and frame, sedentary activity level, reported/observed dysfunctional eating patterns, and excess body fat by triceps skinfold/other measurements.

Body Image, disturbed/Self-Esteem, chronic low may be related to view of self in contrast with societal values, family/subculture encouragement of overeating; control, sex, and love issues; possibly evidenced by negative feelings about body, fear of rejection/reaction of others, feelings of hopelessness/powerlessness, and lack of follow-through with treatment plan.

Activity Intolerance may be related to imbalance between oxygen supply and demand, and sedentary lifestyle, possibly evidenced by fatigue or weakness, exertional discomfort, and abnormal heart rate/blood pressure response.

Social Interaction, impaired may be related to verbalized/observed discomfort in social situations, self-concept disturbance, possibly evidenced by reluctance to participate in social gatherings, verbalization of a sense of discomfort with others, feeling of rejection, absence of/ineffective supportive significant other(s).

osteoarthritis (degenerative joint disease)

Refer to *arthritis, rheumatoid* (Although this is a degenerative process versus the inflammatory process of rheumatoid arthritis, nursing concerns are the same.)

osteomyelitis

Pain, acute may be related to inflammation and tissue necrosis, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

Hyperthermia may be related to increased metabolic rate and infectious process, possibly evidenced by increased body temperature and warm/flushed skin.

Tissue Perfusion, ineffective: bone may be related to inflammatory reaction with thrombosis of vessels, destruction of tissue, edema, and abscess formation, possibly evidenced by bone necrosis, continuation of infectious process, and delayed healing.

Walking, risk for impaired: risk factors may include inflammation and tissue necrosis, pain, joint instability.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition, long-term therapy needs, activity restriction, and prevention of complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions and misconceptions, and inaccurate follow-through of instructions.

osteoporosis

Trauma, risk for: risk factors may include loss of bone density/integrity, increasing risk of fracture with minimal or no stress.

Pain, acute/chronic may be related to vertebral compression on spinal nerve/muscles/ligaments, spontaneous fractures, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and changes in sleep pattern.

Mobility, impaired physical may be related to pain and musculoskeletal impairment, possibly evidenced by limited range of motion, reluctance to attempt movement/expressed fear of reinjury, and imposed restrictions/limitations.

palsy, cerebral (spastic hemiplegia)

Mobility, impaired physical may be related to muscular weakness/hypertonicity, increased deep tendon reflexes, tendency to contractures, and underdevelopment of affected limbs, possibly evidenced by decreased muscle strength, control, mass, limited range of motion, and impaired coordination.

Coping, compromised family may be related to permanent nature of condition, situational crisis, emotional conflicts/temporary family disorganization, and incomplete information/understanding of patient's needs, possibly evidenced by verbalized anxiety/guilt regarding patient's disability, inadequate understanding and knowledge base, and displaying protective behaviors disproportionate (too little/too much) to patient's abilities or need for autonomy.

Growth and Development, delayed may be related to effects of physical disability, possibly evidenced by altered physical growth, delay or difficulty in performing skills (motor, social, expressive), and altered ability to perform self-care/self-control activities appropriate to age.

pancreatitis

Pain, acute may be related to obstruction of pancreatic/biliary ducts, chemical contamination of peritoneal surfaces by pancreatic exudate/autodigestion, extension of inflammation to the retroperitoneal nerve plexus, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, grimacing, autonomic responses (changes in vital signs), and alteration in muscle tone.

Fluid Volume, risk for deficient: risk factors may include excessive gastric losses (vomiting, nasogastric suctioning), increase in size of vascular bed (vasodilation, effects of

kinins), third-space fluid transudation, ascites formation, alteration of clotting process, hemorrhage.

Nutrition: less than body requirements, imbalanced may be related to vomiting, decreased oral intake as well as altered ability to digest nutrients (loss of digestive enzymes/insulin), possibly evidenced by reported inadequate food intake, aversion to eating, reported altered taste sensation, weight loss, and reduced muscle mass.

Infection, risk for: risk factors may include inadequate primary defenses (stasis of body fluids, altered peristalsis, change in pH secretions), immunosuppression, nutritional deficiencies, tissue destruction, and chronic disease.

paranoid disorders

Violence, risk for directed at others/self: risk factors may include perceived threats of danger, paranoid delusions, and increased feelings of anxiety.

Anxiety [severe] may be related to inability to trust (has not mastered tasks of trust versus mistrust), possibly evidenced by rigid delusional system (serves to provide relief from stress that justifies the delusion), frightened of other people and own hostility.

Powerlessness may be related to feelings of inadequacy, lifestyle of helplessness, maladaptive interpersonal interactions (e.g., misuse of power, force; abusive relationships), sense of severely impaired self-esteem, and belief that individual has no control over situation(s), possibly evidenced by use of paranoid delusions, use of aggressive behavior to compensate, and expressions of recognition of damage paranoia has caused self and others.

Thought Processes, disturbed may be related to psychological conflicts, increased anxiety, and fear, possibly evidenced by difficulties in the process and character of thought, interference with the ability to think clearly and logically, delusions, or fragmentation and autistic thinking.

Coping, compromised family may be related to temporary or sustained family disorganization/role changes, prolonged progression of condition that exhausts the supportive capacity of significant other(s), possibly evidenced by family system not meeting physical/emotional/spiritual needs of its members, inability to express or to accept wide range of feelings, inappropriate boundary maintenance; significant other(s) describes preoccupation with personal reactions.

paraplegia

(also refer to *quadriplegia*)

Transfer Ability, impaired may be related to loss of muscle function/control, injury to upper extremity joints (overuse).

Sensory/Perception, disturbed: kinesthetic, tactile may be related to neurologic deficit with loss of sensory reception and transmission, psychological stress, possibly evidenced by reported/measured change in sensory acuity and loss of usual response to stimuli.

Urinary Incontinence, reflex/Elimination, impaired may be related to loss of nerve conduction above the level of the reflex arc, possibly evidenced by lack of awareness of bladder filling/fullness, absence of urge to void, and uninhibited bladder contraction, urinary tract infections, kidney stone formation.

Body Image, disturbed/Role Performance, ineffective may be related to loss of body functions, change in physical ability to resume role, perceived loss of self/identity, possibly evidenced by negative feelings about body/self, feelings of helplessness/powerlessness, delay in taking responsibility for self-care/participation in therapy, and change in social involvement.

Sexual Dysfunction may be related to loss of sensation, altered function, vulnerability, possibly evidenced by seeking of confirmation of desirability, verbalization of concern, and alteration in relationship with significant other, and change in interest in self/others.

parathyroidectomy

Pain, acute may be related to presence of surgical incision and effects of calcium imbalance (bone pain, tetany), possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

Fluid Volume, risk for excess: risk factors may include preoperative renal involvement, stress-induced release of ADH, and changing calcium/electrolyte levels.

Airway Clearance, risk for ineffective: risk factors may include edema formation and laryngeal nerve damage.

Knowledge, deficient [Learning Need] regarding postoperative care/complications and long-term needs may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

Parkinson's disease
Walking, impaired may be related to neuromuscular impairment (muscle weakness, tremors, bradykinesia) and musculoskeletal impairment (joint rigidity), possibly evidenced by inability to move about the environment as desired, increased occurrence of falls.
Swallowing, impaired may be related to neuromuscular impairment/muscle weakness, possibly evidenced by reported/observed difficulty in swallowing, drooling, evidence of aspiration (choking, coughing).
Communication, impaired verbal may be related to muscle weakness and incoordination, possibly evidenced by impaired articulation, difficulty with phonation, and changes in rhythm and intonation.
Caregiver Role Strain may be related to illness severity of care receiver, psychological/cognitive problems in care receiver, caregiver is spouse, duration of caregiving required, lack of respite/recreation for caregiver, possibly evidenced by feeling stressed, depressed, worried; lack of resources/support, family conflict.

pelvic inflammatory disease
Infection, risk for spread: risk factors may include presence of infectious process in highly vascular pelvic structures, delay in seeking treatment.
Pain, acute may be related to inflammation, edema, and congestion of reproductive/pelvic tissues, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Hyperthermia may be related to inflammatory process/hypermetabolic state, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Self-Esteem, risk for situational low: risk factors may include perceived stigma of physical condition (infection of reproductive system).
Knowledge, deficient [Learning Need] regarding cause/complications of condition, therapy needs, and transmission of disease to others may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and development of preventable complications.

periarteritis nodosa
Refer to *polyarteritis (nodosa)*.

pericarditis
Pain, acute may be related to inflammation and presence of effusion, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Activity Intolerance may be related to imbalance between oxygen supply and demand (restriction of cardiac filling/ventricular contraction, reduced cardiac output), possibly evidenced by reports of weakness/fatigue, exertional dyspnea, abnormal heart rate or blood pressure response, and signs of congestive heart failure.
Cardiac Output, risk for decreased: risk factors may include accumulation of fluid (effusion) restricting cardiac filling/contractility.
Anxiety [specify level] may be related to change in health status and perceived threat of death, possibly evidenced by increased tension, apprehension, restlessness, and expressed concerns.

peripheral vascular disease (atherosclerosis)
Tissue Perfusion, ineffective: peripheral may be related to reduction or interruption of arterial/venous blood flow, possibly evidenced by changes in skin temperature/color, lack of hair growth, blood pressure/pulse changes in extremity, presence of bruits, and reports of claudication.
Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of muscle fatigue/weakness and exertional discomfort (claudication).
Skin/Tissue Integrity, risk for impaired: risk factors may include altered circulation with decreased sensation and impaired healing.

peritonitis
Infection, risk for spread/septicemia: risk factors may include inadequate primary defenses (broken skin, traumatized tissue, altered peristalsis), inadequate secondary defenses (immunosuppression), and invasive procedures.
Fluid Volume, deficient [mixed] may be related to fluid shifts from extracellular, intravascular, and interstitial compartments into intestines and/or peritoneal space, excessive gastric losses (vomiting, diarrhea, nasogastric suction), hypermetabolic state, and restricted intake, possibly evidenced by dry mucous membranes, poor skin turgor,

delayed capillary refill, weak peripheral pulses, diminished urinary output, dark/concentrated urine, hypotension, and tachycardia.
Pain, acute may be related to chemical irritation of parietal peritoneum, trauma to tissues, accumulation of fluid in abdominal/peritoneal cavity, possibly evidenced by verbal reports, muscle guarding/rebound tenderness, distraction behaviors, facial mask of pain, self-focus, autonomic responses (changes in vital signs).
Nutrition: risk for less than body requirements, imbalanced: risk factors may include nausea/vomiting, intestinal dysfunction, metabolic abnormalities, or increased metabolic needs.

pheochromocytoma
Anxiety [specify level] may be related to excessive physiologic (hormonal) stimulation of the sympathetic nervous system, situational crises, threat to/change in health status, possibly evidenced by apprehension, shakiness, restlessness, focus on self, fearfulness, diaphoresis, and sense of impending doom.
Fluid Volume, deficient [mixed] may be related to excessive gastric losses (vomiting/diarrhea), hypermetabolic state, diaphoresis, and hyperosmolar diuresis, possibly evidenced by hemoconcentration, dry mucous membranes, poor skin turgor, thirst, and weight loss.
Cardiac Output, decreased/Tissue Perfusion, ineffective (specify) may be related to altered preload/decreased blood volume, altered systemic vascular resistance, and increased sympathetic activity (excessive secretion of catecholamines), possibly evidenced by cool/clammy skin, change in blood pressure (hypertension/postural hypotension), visual disturbances, severe headache, and angina.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition, outcome, preoperative and postoperative care needs may be related to lack of information/recall, possibly evidenced by statements of concern, questions, and misconceptions.

phlebitis
Refer to *thrombophlebitis*.

phobia
(also refer to *anxiety disorder, generalized*)
Fear may be related to learned irrational response to natural or innate origins (phobic stimulus), unfounded morbid dread of a seemingly harmless object/situation, possibly evidenced by sympathetic stimulation and reactions ranging from apprehension to panic, withdrawal from/total avoidance of situations that place individual in contact with feared object.
Social Interaction, impaired may be related to intense fear of encountering feared object/activity or situation and anticipated loss of control, possibly evidenced by reported change of style/pattern of interaction, discomfort in social situations, and avoidance of phobic stimulus.

placenta previa
Fluid Volume, risk for deficient: risk factors may include excessive vascular losses (vessel damage and inadequate vasoconstriction).
Gas Exchange, impaired fetal may be related to altered blood flow, altered carrying capacity of blood (maternal anemia), and decreased surface area of gas exchange at site of placental attachment, possibly evidenced by changes in fetal heart rate/activity and release of meconium.
Fear may be related to threat of death (perceived or actual) to self or fetus, possibly evidenced by verbalization of specific concerns, increased tension, sympathetic stimulation.
Diversional Activity, risk for deficient: risk factors may include imposed activity restrictions/bedrest.

pleurisy
Pain, acute may be related to inflammation/irritation of the parietal pleura, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Breathing Pattern, ineffective may be related to pain on inspiration, possibly evidenced by decreased respiratory depth, tachypnea, and dyspnea.
Infection, risk for pneumonia: risk factors may include stasis of pulmonary secretions, decreased lung expansion, and ineffective cough.

pneumonia
Refer to *bronchitis*; *bronchopneumonia*.

pneumothorax
(also refer to *hemothorax*)
Breathing Pattern, ineffective may be related to decreased lung expansion (fluid/air accumulation), musculoskeletal impairment, pain, inflammatory process, possibly evidenced by dyspnea, tachypnea, altered chest excursion, respiratory depth changes, use of accessory muscles/nasal flaring, cough, cyanosis, and abnormal ABGs.
Cardiac Output, risk for decreased: risk factors may include compression/displacement of cardiac structures.
Pain, acute may be related to irritation of nerve endings within pleural space by foreign object (chest tube), possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

polyarteritis (nodosa)
Tissue Perfusion, ineffective (specify) may be related to reduction/interruption of blood flow, possibly evidenced by organ tissue infarctions, changes in organ function, and development of organic psychosis.
Hyperthermia may be related to widespread inflammatory process, possibly evidenced by increased body temperature and warm/flushed skin.
Pain, acute may be related to inflammation, tissue ischemia, and necrosis of affected area, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Grieving, anticipatory may be related to perceived loss of self, possibly evidenced by expressions of sorrow and anger, altered sleep and/or eating patterns, and changes in activity level or libido.

polycythemia vera
Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue/weakness.
Tissue Perfusion, ineffective (specify) may be related to reduction/interruption of arterial/venous blood flow (insufficiency, thrombosis, or hemorrhage), possibly evidenced by pain in affected area, impaired mental ability, visual disturbances, and color changes of skin/mucous membranes.

polyradiculitis
Refer to *Guillain-Barré syndrome*.

postoperative recovery period
Breathing Pattern, ineffective may be related to neuromuscular and perceptual/cognitive impairment, decreased lung expansion/energy, and tracheobronchial obstruction, possibly evidenced by changes in respiratory rate and depth, reduced vital capacity, apnea, cyanosis, and noisy respirations.
Body Temperature, risk for imbalanced: risk factors may include exposure to cool environment, effect of medications/anesthetic agents, extremes of age/weight, and dehydration.
Sensory/Perception, disturbed (specify)/Thought Processes, disturbed may be related to chemical alteration (use of pharmaceutical agents, hypoxia), therapeutically restricted environment, excessive sensory stimuli and physiologic stress, possibly evidenced by changes in usual response to stimuli, motor incoordination, impaired ability to concentrate, reason, and make decisions; and disorientation to person, place, and time.
Fluid Volume, risk for deficient: risk factors may include restriction of oral intake, loss of fluid through abnormal routes (indwelling tubes, drains), normal routes (vomiting, loss of vascular integrity, changes in clotting ability), and extremes of age and weight.
Pain, acute may be related to disruption of skin, tissue, and muscle integrity, musculoskeletal/bone trauma, and presence of tubes and drains, possibly evidenced by verbal reports, alteration in muscle tone, facial mask of pain, distraction/guarding behaviors, narrowed focus, and autonomic responses.
Skin/Tissue Integrity, impaired may be related to mechanical interruption of skin/tissues, altered circulation, effects of medication, accumulation of drainage, and altered metabolic state, possibly evidenced by disruption of skin surface/layers and tissues.
Infection, risk for: risk factors may include broken skin, traumatized tissues, stasis of body fluids, presence of pathogens/contaminants, environmental exposure, and invasive procedures.

postpartal period
Parent/Infant Attachment/Parenting, risk for impaired: risk factors may include lack of support between/from significant other(s), ineffective or no role model, anxiety asso-

ciated with the parental role, unrealistic expectations, presence of stressors (e.g., financial, housing, employment).
Fluid Volume, risk for deficient: risk factors may include excessive blood loss during delivery, reduced intake/inadequate replacement, nausea/vomiting, increased urine output, and insensible losses.
Pain, acute/[Discomfort] may be related to tissue trauma/edema, muscle contractions, bladder fullness, and physical/psychological exhaustion, possibly evidenced by reports of cramping (afterpains), self-focusing, alteration in muscle tone, distraction behavior, and autonomic responses (changes in vital signs).
Urinary Elimination, impaired may be related to hormonal effects (fluid shifts/continued elevation in renal plasma flow), mechanical trauma/tissue edema, and effects of medication/anesthesia, possibly evidenced by frequency, dysuria, urgency, incontinence, or retention.
Constipation may be related to decreased muscle tone associated with diastasis recti, prenatal effects of progesterone, dehydration, excess analgesia or anesthesia, pain (hemorrhoids, episiotomy, or perineal tenderness), prelabor diarrhea, and lack of intake, possibly evidenced by frequency less than usual pattern, hard-formed stool, straining at stool, decreased bowel sounds, and abdominal distention.
Sleep Pattern, disturbed may be related to pain/discomfort, intense exhilaration/excitement, anxiety, exhausting process of labor/delivery, and needs/demands of family members, possibly evidenced by verbal reports of difficulty in falling asleep/not feeling well-rested, interrupted sleep, frequent yawning, irritability, or dark circles under eyes.

post-traumatic stress disorder
Post-Trauma Syndrome related to having experienced a traumatic life event, possibly evidenced by reexperiencing of the event, somatic reactions, psychic/emotional numbness, altered lifestyle, impaired sleep, self-destructive behaviors, difficulty with interpersonal relationships, development of phobia, poor impulse control/irritability, and explosiveness.
Violence, risk for directed at others: risk factors may include a startle reaction, an intrusive memory causing a sudden acting-out of a feeling as if the event were occurring; use of alcohol/other drugs to ward off painful effects and produce psychic numbing, breaking through the rage that has been walled off, response to intense anxiety or panic state, and loss of control.
Coping, ineffective may be related to personal vulnerability, inadequate support system, unrealistic perceptions, unmet expectations, overwhelming threat to self, and multiple stressors repeated over period of time, possibly evidenced by verbalization of inability to cope or difficulty asking for help, muscular tension/headaches, chronic worry, and emotional tension.
Grieving, dysfunctional may be related to actual/perceived object loss (loss of self as seen before the traumatic incident occurred as well as other losses incurred in/after the incident), loss of physiopsychosocial well-being, thwarted grieving response to a loss, and lack of resolution of previous grieving responses, possibly evidenced by verbal expression of distress at loss, anger, sadness, labile affect, alterations in eating habits, sleep/dream patterns, libido; reliving of past experiences, expression of guilt, and alterations in concentration.
Family Processes, interrupted may be related to situational crisis, failure to master developmental transitions, possibly evidenced by expressions of confusion about what to do and that family is having difficulty coping, family system not meeting physical/emotional/spiritual needs of its members, not adapting to change or dealing with traumatic experience constructively, and ineffective family decision-making process.

pregnancy (prenatal period)
Nutrition: risk for less than body requirements, imbalanced: risk factors may include changes in appetite, insufficient intake (nausea/vomiting, inadequate financial resources and nutritional knowledge); meeting increased metabolic demands (increased thyroid activity associated with the growth of fetal and maternal tissues).
[Discomfort]/Pain, acute may be related to hormonal influences, physical changes, possibly evidenced by verbal reports (nausea, breast changes, leg cramps, hemorrhoids, nasal stuffiness), alteration in muscle tone, restlessness, and autonomic responses (changes in vital signs).
Injury, risk for fetal: risk factors may include environmental/hereditary factors and problems of maternal well-being that directly affect the developing fetus (e.g., malnutrition, substance use).
Cardiac Output, [maximally compensated] may be related to increased fluid volume/maximal cardiac effort and hormonal effects of progesterone and relaxin (that place

the patient at risk for hypertension and/or circulatory failure), and changes in peripheral resistance (afterload), possibly evidenced by variations in blood pressure and pulse, syncopal episodes, or presence of pathological edema.

Coping, readiness for enhanced family may be related to situational/maturational crisis with anticipated changes in family structure/roles, needs sufficiently met and adaptive tasks effectively addressed to enable goals of self-actualization to surface, as evidenced by movement toward health-promoting and enriching lifestyle, choosing experiences that optimize pregnancy experience/wellness.

Constipation, risk for: risk factors may include changes in dietary/fluid intake, smooth muscle relaxation, decreased peristalsis, and effects of medications (e.g., iron).

Fatigue/Sleep Pattern, disturbed may be related to increased carbohydrate metabolism, altered body chemistry, increased energy requirements to perform activities of daily living, discomfort, anxiety, inactivity, possibly evidenced by reports of overwhelming lack of energy/inability to maintain usual routines, difficulty falling asleep/not feeling well-rested, interrupted sleep, irritability, lethargy, and frequent yawning.

Role Performance, risk for ineffective: risk factors may include maturational crisis, developmental level, history of maladaptive coping, or absence of support systems.

Knowledge, deficient [Learning Need] regarding normal physiological/psychological changes and self-care needs may be related to lack of information/recall and misinterpretation of normal physiological/psychological changes and their impact on the client/family, possibly evidenced by questions, statements of concern, misconceptions, and inaccurate follow-through of instructions/development of preventable complications.

pregnancy, adolescent

(also refer to *pregnancy, prenatal period*)

Family Processes, interrupted may be related to situational/developmental transition (economic, change in roles/gain of a family member), possibly evidenced by family expressing confusion about what to do, unable to meet physical/emotional/spiritual needs of the members, family inability to adapt to change or to deal with traumatic experience constructively, does not demonstrate respect for individuality and autonomy of its members, ineffective family decision-making process, and inappropriate boundary maintenance.

Social Isolation may be related to alterations in physical appearance, perceived unacceptable social behavior, restricted social sphere, stage of adolescence, and interference with accomplishing developmental tasks, possibly evidenced by expressions of feelings of aloneness/rejection/difference from others, uncommunicative, withdrawn, no eye contact, seeking to be alone, unacceptable behavior, and absence of supportive significant other(s).

Body Image, disturbed (specify)/Self-Esteem may be related to situational/maturational crisis, biophysical changes, and fear of failure at life events, absence of support systems, possibly evidenced by self-negating verbalizations, expressions of shame/guilt, fear of rejection/reaction of others, hypersensitivity to criticism, and lack of follow-through/nonparticipation in prenatal care.

Knowledge, deficient [Learning Need] regarding pregnancy, developmental/individual needs, future expectations may be related to lack of exposure, information misinterpretation, unfamiliarity with information resources, lack of interest in learning, possibly evidenced by questions, statements of concern/misconception, sense of vulnerability/denial of reality, inaccurate follow-through of instruction, and development of preventable complications.

Parenting, risk for impaired: may be related to chronological age/developmental stage, unmet social/emotional/maturational needs of parenting figures, unrealistic expectation of self/infant/partner, ineffective role model/social support, lack of role identity, and presence of stressors (e.g., financial, social).

pregnancy-induced hypertension (pre-eclampsia)

Fluid Volume, deficient [isotonic] may be related to a plasma protein loss, decreasing plasma colloid osmotic pressure allowing fluid shifts out of vascular compartment, possibly evidenced by edema formation, sudden weight gain, hemoconcentration, nausea/vomiting, epigastric pain, headaches, visual changes, decreased urine output.

Cardiac Output, decreased may be related to hypovolemia/decreased venous return, increased SVR, possibly evidenced by variations in blood pressure/hemodynamic readings, edema, shortness of breath, change in mental status.

Tissue Perfusion, ineffective: [uteroplacental] may be related to vasospasm of spiral arteries and relative hypovolemia, possibly evidenced by changes in fetal heart rate/activity, reduced weight gain, and premature delivery/fetal demise.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition, therapy, self-care/nutritional needs, and potential complications may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, inaccurate follow-through of instructions/development of preventable complications.

premenstrual tension syndrome (PMS)

Pain, chronic/acute may be related to cyclic changes in female hormones affecting other systems (e.g., vascular congestion/spasms), vitamin deficiency, fluid retention, possibly evidenced by increased tension, apprehension, jitteriness, verbal reports, distraction behaviors, somatic complaints, self-focusing, physical and social withdrawal.

Fluid Volume excess may be related to abnormal alterations of hormonal levels, possibly evidenced by edema formation, weight gain, and periodic changes in emotional status/irritability.

Anxiety [specify level] may be related to cyclic changes in female hormones affecting other systems, possibly evidenced by feelings of inability to cope/loss of control, depersonalization, increased tension, apprehension, jitteriness, somatic complaints, and impaired functioning.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition and self-care/treatment needs may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and continuation of condition, exacerbating symptoms.

pressure ulcer or sore

(also refer to *ulcer, decubitus*)

Tissue Perfusion, ineffective: peripheral may be related to reduced/interrupted blood flow, possibly evidenced by presence of inflamed, necrotic lesion.

Knowledge, deficient [Learning Need] regarding cause/prevention of condition and potential complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions.

preterm labor

Refer to *labor, preterm*.

prostatectomy

Urinary Elimination, impaired may be related to mechanical obstruction (blood clots, edema, trauma, surgical procedure, pressure/irritation of catheter/balloon), and loss of bladder tone, possibly evidenced by dysuria, frequency, dribbling, incontinence, retention, bladder fullness, suprapubic discomfort.

Fluid Volume, risk for deficient: risk factors may include trauma to highly vascular area with excessive vascular losses, restricted intake, postobstructive diuresis.

Pain, acute may be related to irritation of bladder mucosa and tissue trauma/edema, possibly evidenced by verbal reports (bladder spasms), distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

Body Image, disturbed may be related to perceived threat of altered body/sexual function, possibly evidenced by preoccupation with change/loss, negative feelings about body, and statements of concern regarding functioning.

Sexual Dysfunction, risk for: risk factors may include situational crisis (incontinence, leakage of urine after catheter removal, involvement of genital area) and threat to self-concept/change in health status.

pruritus

Pain, acute may be related to cutaneous hyperesthesia and inflammation, possibly evidenced by verbal reports, distraction behaviors, and self-focus.

Skin Integrity, risk for impaired: risk factors may include mechanical trauma (scratching) and development of vesicles/bullae that may rupture.

psoriasis

Skin Integrity, impaired may be related to increased epidermal cell proliferation and absence of normal protective skin layers, possibly evidenced by scaling papules and plaques.

Body Image, disturbed may be related to cosmetically unsightly skin lesions, possibly evidenced by hiding affected body part, negative feelings about body, feelings of helplessness, and change in social involvement.

pulmonary embolus

Breathing Pattern, ineffective may be related to tracheobronchial obstruction (inflammation, copious secretions or active bleeding), decreased lung expansion, inflammatory process, possibly evidenced by changes in depth and/or rate of respiration, dyspnea/use of accessory muscles, altered chest excursion, abnormal breath sounds (crackles, wheezes), and cough (with or without sputum production).

Gas Exchange, impaired may be related to altered blood flow to alveoli or to major portions of the lung, alveolar-capillary membrane changes (atelectasis, airway/alveolar collapse, pulmonary edema/effusion, excessive secretions/active bleeding), possibly evidenced by profound dyspnea, restlessness, apprehension, somnolence, cyanosis, and changes in ABGs/pulse oximetry (hypoxemia and hypercapnia).

Tissue Perfusion, ineffective: cardiopulmonary may be related to interruption of blood flow (arterial/venous), exchange problems at alveolar level or at tissue level (acidotic shifting of the oxyhemoglobin curve), possibly evidenced by radiology/laboratory evidence of ventilation/perfusion mismatch, dyspnea, and central cyanosis.

Fear/Anxiety [specify level] may be related to severe dyspnea/inability to breathe normally, perceived threat of death, threat to/change in health status, physiological response to hypoxemia/acidosis, and concern regarding unknown outcome of situation, possibly evidenced by restlessness, irritability, withdrawal or attack behavior, sympathetic stimulation (cardiovascular excitation, pupil dilation, sweating, vomiting, diarrhea), crying, voice quivering, and impending sense of doom.

purpura, idiopathic thrombocytopenic

Protection, ineffective may be related to abnormal blood profile, drug therapy (corticosteroids or immunosuppressive agents), possibly evidenced by altered clotting, fatigue, deficient immunity.

Activity Intolerance may be related to decreased oxygen-carrying capacity/imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue/weakness.

Knowledge, deficient [Learning Need] regarding therapy choices, outcomes, and self-care needs may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

pyelonephritis

Pain, acute may be related to acute inflammation of renal tissues, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

Hyperthermia may be related to inflammatory process/increased metabolic rate, possibly evidenced by increase in body temperature, warm/flushed skin, tachycardia, and chills.

Urinary Elimination, impaired may be related to inflammation/irritation of bladder mucosa, possibly evidenced by dysuria, urgency, and frequency.

Knowledge, deficient [Learning Need] regarding therapy needs and prevention may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and recurrence of condition.

quadriplegia

(also refer to *paraplegia*)

Breathing Pattern, ineffective may be related to neuromuscular impairment (diaphragm and intercostal muscle function), reflex abdominal spasms, gastric distention, possibly evidenced by decreased respiratory depth, dyspnea, cyanosis, and abnormal ABGs.

Trauma, risk for additional spinal injury: risk factors may include temporary weakness/instability of spinal column.

Grieving, anticipatory may be related to perceived loss of self, anticipated alterations in lifestyle and expectations, and limitation of future options/choices, possibly evidenced by expressions of distress, anger, sorrow; choked feelings; and changes in eating habits, sleep, and communication patterns.

Self-Care Deficit: total related to neuromuscular impairment, evidenced by inability to perform self-care tasks.

Mobility, impaired bed/wheelchair may be related to loss of muscle function/control.

Autonomic Dysreflexia, risk for: risk factors may include altered nerve function (spinal cord injury at T6 or above), bladder/bowel/skin stimulation (tactile, pain, thermal).

Home Maintenance, impaired may be related to permanent effects of injury, inadequate/absent support systems and finances, and lack of familiarity with resources, possibly evidenced by expressions of difficulties, requests for information and assistance, outstanding debts/financial crisis, and lack of necessary aides and equipment.

rape

Knowledge, deficient [Learning Need] regarding required medical/legal procedures, prophylactic treatment for individual concerns (STDs, pregnancy), community resources/supports may be related to lack of information, possibly evidenced by statements of concern, questions, misconceptions, and exacerbation of symptoms.

Rape-Trauma Syndrome (acute phase) related to actual or attempted sexual penetration without consent, possibly evidenced by wide range of emotional reactions, including anxiety, fear, anger, embarrassment, and multisystem physical complaints.

Tissue Integrity, risk for impaired: risk factors may include forceful sexual penetration and trauma to fragile tissues.

Coping, ineffective may be related to personal vulnerability, unmet expectations, unrealistic perception, inadequate support systems/coping methods, multiple stressors repeated over time, overwhelming threat to self, possibly evidenced by verbalizations of inability to cope or difficulty asking for help, muscular tension/headaches, emotional tension, chronic worry.

Sexual Dysfunction may be related to biopsychosocial alteration of sexuality (stress of post-trauma response), vulnerability, loss of sexual desire, impaired relationship with significant other, possibly evidenced by alteration in achieving sexual satisfaction, change in interest in self/others, preoccupation with self.

Raynaud's phenomenon

Pain, acute/chronic may be related to vasospasm/altered perfusion of affected tissues and ischemia/destruction of tissues, possibly evidenced by verbal reports, guarding of affected parts, guarding of affected parts, self-focusing, and restlessness.

Tissue Perfusion, ineffective, peripheral may be related to periodic reduction of arterial blood flow to affected areas, possibly evidenced by pallor, cyanosis, coolness, numbness, paresthesia, slow healing of lesions.

Knowledge, deficient [Learning Need] regarding pathophysiology of the condition, potential for complications, therapy/self-care needs may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions; development of preventable complications.

reflex sympathetic dystrophy (RSD)

Pain, acute/chronic may be related to continued nerve stimulation, possibly evidenced by verbal reports, distraction/guarding behaviors, narrowed focus, changes in sleep patterns, and altered ability to continue previous activities.

Tissue Perfusion, ineffective: peripheral may be related to reduction of arterial blood flow (arteriole vasoconstriction), possibly evidenced by reports of pain, decreased skin temperature and pallor, diminished arterial pulsations, and tissue swelling.

Sensory/Perception, disturbed: tactile may be related to altered sensory reception (neurologic deficit, pain), possibly evidenced by change in usual response to stimuli/abnormal sensitivity of touch, physiologic anxiety, and irritability.

Role Performance, risk for ineffective: risk factors may include situational crisis, chronic disability, debilitating pain.

Coping, risk for compromised family: risk factors may include temporary family disorganization and role changes and prolonged disability that exhausts the supportive capacity of significant other(s).

renal failure, acute

Fluid Volume excess may be related to compromised regulatory mechanisms (decreased kidney function), possibly evidenced by weight gain, edema/anasarca, intake greater than output, venous congestion, changes in BP/CVP, and altered electrolyte levels.

Nutrition: less than body requirements, imbalanced may be related to inability to ingest/digest adequate nutrients (anorexia, nausea/vomiting, ulcerations of oral mucosa, and increased metabolic needs) in addition to therapeutic dietary restrictions, possibly evidenced by lack of interest in food/aversion to eating, observed inadequate intake, weight loss, loss of muscle mass.

Infection, risk for: risk factors may include depression of immunological defenses, invasive procedures/devices, and changes in dietary intake/malnutrition.

Thought Processes, disturbed may be related to accumulation of toxic waste products and altered cerebral perfusion, possibly evidenced by disorientation, changes in recent memory, apathy, and episodic obtundation.

renal transplantation

Fluid Volume, risk for excess: risk factors may include compromised regulatory mechanism (implantation of new kidney requiring adjustment period for optimal functioning).

Body Image, disturbed may be related to failure and subsequent replacement of body part and medication-induced changes in appearance, possibly evidenced by preoccupation with loss/change, negative feelings about body, and focus on past strength/function.
Fear may be related to potential for transplant rejection/failure and threat of death, possibly evidenced by increased tension, apprehension, concentration on source, and verbalizations of concern.
Infection, risk for: risk factors may include broken skin/traumatized tissue, stasis of body fluids, immunosuppression, invasive procedures, nutritional deficits, and chronic disease.
Coping, Individual/Family risk for ineffective: risk factors may include situational crises, family disorganization and role changes, prolonged disease exhausting supportive capacity of significant other/family, therapeutic restrictions/long-term therapy needs.

respiratory distress syndrome (premature infant)

(also refer to *neonate, premature newborn*)

Gas Exchange, impaired may be related to alveolar/capillary membrane changes (inadequate surfactant levels), altered oxygen supply (tracheobronchial obstruction, atelectasis), altered blood flow (immaturity of pulmonary arteriole musculature), altered oxygen-carrying capacity of blood (anemia), and cold stress, possibly evidenced by tachypnea, use of accessory muscles/retractions, expiratory grunting, pallor or cyanosis, abnormal ABGs, and tachycardia.
Ventilation, impaired spontaneous may be related to respiratory muscle fatigue and metabolic factors, possibly evidenced by dyspnea, increased metabolic rate, restlessness, use of accessory muscles, and abnormal ABGs.
Infection, risk for: risk factors may include inadequate primary defenses (decreased ciliary action, stasis of body fluids, traumatized tissues), inadequate secondary defenses (deficiency of neutrophils and specific immunoglobulins), invasive procedures, and malnutrition (absence of nutrient stores, increased metabolic demands).
Tissue Perfusion, risk for ineffective: gastrointestinal: risk factors may include persistent fetal circulation and exchange problems.
Attachment, risk for impaired parent/infant/child: risk factors may include premature/ill infant who is unable to effectively initiate parental contact (altered behavioral organization), separation, physical barriers, anxiety associated with the parental role/demands of infant.

retinal detachment

Sensory/Perception, disturbed: visual related to decreased sensory reception, possibly evidenced by visual distortions, decreased visual field, and changes in visual acuity.
Knowledge, deficient [Learning Need] regarding therapy, prognosis, and self-care needs may be related to lack of information/misconceptions, possibly evidenced by statements of concern and questions.
Home Maintenance, risk for impaired: risk factors may include visual limitations/activity/restrictions.

Reye's syndrome

Fluid Volume, deficient [isotonic] may be related to failure of regulatory mechanism (diabetes insipidus), excessive gastric losses (pernicious vomiting), and altered intake, possibly evidenced by increased/dilute urine output, sudden weight loss, decreased venous filling, dry mucous membranes, decreased skin turgor, hypotension, and tachycardia.
Tissue Perfusion, ineffective: cerebral may be related to diminished arterial/venous blood flow and hypovolemia, possibly evidenced by memory loss, altered consciousness, and restlessness/agitation.
Trauma, risk for: risk factors may include generalized weakness, reduced coordination, and cognitive deficits.
Breathing Pattern, ineffective may be related to decreased energy and fatigue, cognitive impairment, tracheobronchial obstruction, and inflammatory process (aspiration pneumonia), possibly evidenced by tachypnea, abnormal ABGs, cough, and use of accessory muscles.

rheumatic fever

Pain, acute may be related to migratory inflammation of joints, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Hyperthermia may be related to inflammatory process/hypermetabolic state, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.

Activity Intolerance may be related to generalized weakness, joint pain, and medical restrictions/bedrest, possibly evidenced by reports of fatigue, exertional discomfort, and abnormal heart rate in response to activity.
Cardiac Output, risk for decreased: risk factors may include cardiac inflammation/enlargement and altered contractility.

rickets (osteomalacia)
Growth and Development, delayed may be related to dietary deficiencies/indiscretions, malabsorption syndrome, and lack of exposure to sunlight, possibly evidenced by altered physical growth and delay or difficulty in performing motor skills typical for age.
Knowledge, deficient [Learning Need] regarding cause, pathophysiology, therapy needs and prevention may be related to lack of information, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions.

ringworm, tinea
(also refer to *athlete's foot*)
Skin Integrity, impaired may be related to fungal infection of the dermis, possibly evidenced by disruption of skin surfaces/presence of lesions.
Knowledge, deficient [Learning Need] regarding infectious nature, therapy, and self-care needs may be related to lack of information/misinformation, possibly evidenced by statements of concern, questions, and recurrence/spread.

rubella
Pain, acute/[Discomfort] may be related to inflammatory effects of viral infection and presence of desquamating rash, possibly evidenced by verbal reports, distraction behaviors/restlessness.
Knowledge, deficient [Learning Need] regarding contagious nature, possible complications, and self-care needs may be related to lack of information/misinterpretations, possibly evidenced by statements of concern, questions, and inaccurate follow-through of instructions.

scabies
Skin Integrity, impaired may be related to presence of invasive parasite and development of pruritus, possibly evidenced by disruption of skin surface and inflammation.
Knowledge, deficient [Learning Need] regarding communicable nature, possible complications, therapy, and self-care needs may be related to lack of information/misinterpretation, possibly evidenced by questions and statements of concern about spread to others.

scarlet fever
Hyperthermia may be related to effects of circulating toxins, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Pain [Discomfort] may be related to inflammation of mucous membranes and effects of circulating toxins (malaise, fever), possibly evidenced by verbal reports, distraction behaviors, guarding (decreased swallowing), and self-focus.
Fluid Volume, risk for deficient: risk factors may include hypermetabolic state (hyperthermia) and reduced intake.

schizophrenia (schizophrenic disorders)
Thought Processes, disturbed may be related to disintegration of thinking processes, impaired judgment, presence of psychological conflicts, disintegrated ego-boundaries, sleep disturbance, ambivalence, and concomitant dependence, possibly evidenced by impaired ability to reason/problem solve, inappropriate affect, presence of delusional system, command hallucinations, obsessions, ideas of reference, cognitive dissonance.
Social Isolation may be related to alterations in mental status, mistrust of others/delusional thinking, unacceptable social behaviors, inadequate personal resources, and inability to engage in satisfying personal relationships, possibly evidenced by difficulty in establishing relationships with others; dull affect, uncommunicative/withdrawn behavior, seeking to be alone, inadequate/absent significant purpose in life, and expression of feelings of rejection.
Health Maintenance, ineffective/Home Maintenance, impaired may be related to impaired cognitive/emotional functioning, altered ability to make deliberate and thoughtful judgments, altered communication, and lack/inappropriate use of material resources, possibly evidenced by inability to take responsibility for meeting basic health practices in any or all functional areas and demonstrated lack of adaptive

behaviors to internal or external environmental changes, disorderly surroundings, accumulation of dirt/unwashed clothes, repeated hygienic disorders.

Violence, risk for directed at self/others: risk factors may include disturbances of thinking/feeling (depression, paranoia, suicidal ideation), lack of development of trust and appropriate interpersonal relationships, catatonic/manic excitement, toxic reactions to drugs (alcohol).

Coping, ineffective may be related to personal vulnerability, inadequate support system(s), unrealistic perceptions, inadequate coping methods, and disintegration of thought processes, possibly evidenced by impaired judgment/cognition and perception, diminished problem-solving/decision-making capacities, poor self-concept, chronic anxiety, depression, inability to perform role expectations, and alteration in social participation.

Family Processes, interrupted/ Coping, disabled family may be related to ambivalent family system/relationships, changes of roles, and difficulty of family member in coping effectively with patient's maladaptive behaviors, possibly evidenced by deterioration in family functioning, ineffective family decision-making process, difficulty relating to each other, patient's expression of despair at family's lack of reaction/involvement, neglectful relationships with patient, extreme distortion regarding patient's health problem including denial about its existence/severity or prolonged overconcern.

Self-Care Deficit [specify] may be related to perceptual and cognitive impairment, immobility (withdrawal/isolation and decreased psychomotor activity), and side effects of psychotropic medications, possibly evidenced by inability or difficulty in areas of feeding self, keeping body clean, dressing appropriately, toileting self, and/or changes in bowel/bladder elimination.

sciatica

Pain, acute/chronic may be related to peripheral nerve root compression, possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.

Mobility, impaired physical may be related to neurologic pain and muscular involvement, possibly evidenced by reluctance to attempt movement and decreased muscle strength/mass.

scleroderma

(also refer to *lupus erythematosus, systemic—SLE*)

Mobility, impaired physical may be related to musculoskeletal impairment and associated pain, possibly evidenced by decreased strength, decreased range of motion, and reluctance to attempt movement.

Tissue Perfusion, ineffective (specify) may be related to reduced arterial blood flow (arteriolar vasoconstriction), possibly evidenced by changes in skin temperature/color, ulcer formation, and changes in organ function (cardiopulmonary, gastrointestinal, renal).

Nutrition: less than body requirements, imbalanced may be related to inability to ingest/digest/absorb adequate nutrients (sclerosis of the tissues rendering mouth immobile, decreased peristalsis of esophagus/small intestines, atrophy of smooth muscle of colon), possibly evidenced by weight loss, decreased intake/food and reported/observed difficulty swallowing.

Adjustment, impaired may be related to disability requiring change in lifestyle, inadequate support systems, assault to self-concept, and altered locus of control, possibly evidenced by verbalization of nonacceptance of health status change and lack of movement toward independence/future-oriented thinking.

Body Image, disturbed may be related to skin changes with induration, atrophy, and fibrosis, loss of hair, and skin and muscle contractures, possibly evidenced by verbalization of negative feelings about body, focus on past strength/function or appearance, fear of rejection/reaction by others, hiding body part, and change in social involvement.

scoliosis

Body Image, disturbed may be related to altered body structure, use of therapeutic device(s), and activity restrictions, possibly evidenced by negative feelings about body, change in social involvement, and preoccupation with situation or refusal to acknowledge problem.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition, therapy needs and possible outcomes may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions.

Adjustment, impaired may be related to lack of comprehension of long-term consequences of behavior, possibly evidenced by failure to adhere to treatment regimen/keep appointments and evidence of failure to improve.

sepsis, puerperal
(also refer to *septicemia*)
Infection, risk for spread/septic shock: risk factors may include presence of infection, broken skin, and/or traumatized tissues, rupture of amniotic membranes, high vascularity of involved area, stasis of body fluids, invasive procedures, and/or increased environmental exposure, chronic disease (e.g., diabetes, anemia, malnutrition), altered immune response, and untoward effect of medications (e.g., opportunistic/secondary infection).
Hyperthermia may be related to inflammatory process/hypermetabolic state, possibly evidenced by increase in body temperature, warm/flushed skin, and tachycardia.
Attachment, risk for impaired parent/infant/child: risk factors may include interruption in bonding process, physical illness, perceived threat to own survival.
Tissue Perfusion, risk for ineffective: peripheral: risk factors may include interruption/reduction of blood flow (presence of infectious thrombi).

septicemia
(also refer to *sepsis, puerperal*)
Tissue Perfusion, ineffective (specify) may be related to changes in arterial/venous blood flow (selective vasoconstriction, presence of microemboli) and hypovolemia, possibly evidenced by changes in skin temperature/color, changes in blood/pulse pressure; changes in sensorium, and decreased urinary output.
Fluid Volume, risk for deficient: risk factors may include marked increase in vascular compartment/massive vasodilation, vascular shifts to interstitial space, and reduced intake.
Cardiac Output, risk for decreased: risk factors may include decreased preload (venous return and circulating volume), altered afterload (increased SVR), negative inotropic effects of hypoxia, complement activation, and lysosomal hydrolase.

serum sickness
Pain, acute may be related to inflammation of the joints and skin eruptions, possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.
Knowledge, deficient [Learning Need] regarding nature of condition, treatment needs, potential complications, and prevention of recurrence may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, misconceptions, and inaccurate follow-through of instructions.

sexually transmitted disease (STD)
Infection, risk for transmission: risk factors may include contagious nature of infecting agent and insufficient knowledge to avoid exposure to/transmission of pathogens.
Skin/Tissue Integrity, impaired may be related to invasion of/irritation by pathogenic organism(s), possibly evidenced by disruptions of skin/tissue and inflammation of mucous membranes.
Knowledge, deficient [Learning Need] regarding condition, prognosis/complications, therapy needs, and transmission may be related to lack of information/misinterpretation, lack of interest in learning, possibly evidenced by statements of concern, questions, misconceptions, inaccurate follow-through of instructions, and development of preventable complications.

shock
(also refer to *shock, cardiogenic*; *shock, hemorrhagic/hypovolemic*)
Tissue Perfusion, ineffective (specify) may be related to changes in circulating volume and/or vascular tone, possibly evidenced by changes in skin color/temperature and pulse pressure, reduced blood pressure, changes in mentation, and decreased urinary output.
Anxiety [specify level] may be related to change in health status and threat of death, possibly evidenced by increased tension, apprehension, sympathetic stimulation, restlessness, and expressions of concern.

shock, cardiogenic
(also refer to *shock*)
Cardiac Output, decreased may be related to structural damage, decreased myocardial contractility, and presence of dysrhythmias, possibly evidenced by ECG changes, var-

iations in hemodynamic readings, jugular vein distention, cold/clammy skin, diminished peripheral pulses, and decreased urinary output.

shock, hemorrhagic/hypovolemic
(also refer to *shock*)
Fluid Volume, deficient [isotonic] may be related to excessive vascular loss, inadequate intake/replacement, possibly evidenced by hypotension, tachycardia, decreased pulse volume and pressure, change in mentation, and decreased/concentrated urine.

shock, septic
(Refer to *septicemia*)

sick sinus syndrome
(Also refer to *dysrhythmia, cardiac*)
Cardiac Output, decreased may be related to alterations in rate, rhythm, and electrical conduction, possibly evidenced by ECG evidence of dysrhythmias, reports of palpitations/weakness, changes in mentation/consciousness, and syncope.
Trauma, risk for: risk factors may include changes in cerebral perfusion with altered consciousness/loss of balance.

smallpox
Infection, risk for [spread]: risk factors may include contagious nature of organism, inadequate acquired immunity, presence of chronic disease, immunosuppression.
Fluid Volume, deficient may be related to hypermetabolic state, decreased intake (pharyngeal lesions, nausea), increased losses (vomiting), fluid shifts from vascular bed possibly evidenced by reports of thirst, decreased B/P, venous filling and urinary output; dry mucous membranes, decreased skin turgor, change in mental state, elevated Hct.
Tissue Integrity, impaired may be related to immunological deficit possibly evidenced by disruption of skin surface, cornea, mucous membranes.
Anxiety[specify level]/Fear may be related to threat of death, interpersonal transmission/contagion, separation from support system possibly evidenced by expressed concerns, apprehension, restlessness, focus on self.
Family Processes, interrupted may be related to temporary family disorganization, situational crisis, change in health status of family member possibly evidenced by changes in satisfaction with family, stress-reduction behaviors, mutual support; expression of isolation from community resources.
Coping, ineffective community may be related to human-made disaster (bioterrorism), inadequate resources for problem-solving possibly evidenced by deficits of community participation, high illness rate, excessive community conflicts, expressed vulnerability/powerlessness.

snow blindness
Sensory/Perception, disturbed: visual may be related to altered status of sense organ (irritation of the conjunctiva, hyperemia), possibly evidenced by intolerance to light (photophobia) and decreased/loss of visual acuity.
Pain, acute may be related to irritation/vascular congestion of the conjunctiva, possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.
Anxiety [specify level] may be related to situational crisis and threat to/change in health status, possibly evidenced by increased tension, apprehension, uncertainty, worry, restlessness, and focus on self.

somatoform disorders
Coping, ineffective may be related to severe level of anxiety that is repressed, personal vulnerability, unmet dependency needs, fixation in earlier level of development, retarded ego development, and inadequate coping skills, possibly evidenced by verbalized inability to cope/problem-solve, high illness rate, multiple somatic complaints of several years' duration, decreased functioning in social/occupational settings, narcissistic tendencies with total focus on self/physical symptoms, demanding behaviors, history of "doctor shopping" and refusal to attend therapeutic activities.
Pain, chronic may be related to severe level of repressed anxiety, low self-concept, unmet dependency needs, history of self or loved one having experienced a serious illness, possibly evidenced by verbal reports of severe/prolonged pain, guarded movement/protective behaviors, facial mask of pain, fear of reinjury, altered ability to continue previous activities, social withdrawal, demands for therapy/medication.
Sensory/Perception, disturbed (specify) may be related to psychological stress (narrowed perceptual fields, expression of stress as physical problems/deficits), poor quality of

sleep, presence of chronic pain, possibly evidenced by reported change in voluntary motor or sensory function (paralysis, anosmia, aphonia, deafness, blindness, loss of touch or pain sensation), la belle indifference (lack of concern over functional loss).
Social Interaction, impaired may be related to inability to engage in satisfying personal relationships, preoccupation with self and physical symptoms, altered state of wellness, chronic pain, and rejection by others, possibly evidenced by preoccupation with own thoughts, sad/dull affect, absence of supportive significant other(s), uncommunicative/withdrawn behavior, lack of eye contact, and seeking to be alone.

sprain of ankle or foot
Pain, acute may be related to trauma to/swelling in joint, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focusing, and autonomic responses (changes in vital signs).
Walking, impaired may be related to musculoskeletal injury, pain, and therapeutic restrictions, possibly evidenced by reluctance to attempt movement, inability to move about environment easily.

stapedectomy
Trauma, risk for: risk factors may include increased middle-ear pressure with displacement of prosthesis and balancing difficulties/dizziness.
Infection, risk for: risk factors may include surgically traumatized tissue, invasive procedures, and environmental exposure to upper respiratory infections.
Pain, acute may be related to surgical trauma, edema formation, and presence of packing, possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.

substance dependency/abuse rehabilitation (following acute detoxification)
(also refer to *drug overdose*)
Denial/Coping, ineffective may be related to personal vulnerability, difficulty handling new situations, learned response patterns, cultural factors, personal/family value systems, possibly evidenced by lack of acceptance that drug use is causing the present situation, use of manipulation to avoid responsibility for self, altered social patterns/participation, impaired adaptive behavior and problem-solving skills, employment difficulties, financial affairs in disarray, and decreased ability to handle stress of recent events.
Powerlessness may be related to substance addiction with/without periods of abstinence, episodic compulsive indulgence, attempts at recovery, and lifestyle of helplessness, possibly evidenced by ineffective recovery attempts, statements of inability to stop behavior/requests for help, continuous/constant thinking about drug and/or obtaining drug, alteration in personal/occupational and social life.
Nutrition: less than body requirements, imbalanced may be related to insufficient dietary intake to meet metabolic needs for psychological/physiological/economic reasons, possibly evidenced by weight less than normal for height/body build, decreased subcutaneous fat/muscle mass, reported altered taste sensation, lack of interest in food, poor muscle tone, sore/inflamed buccal cavity, laboratory evidence of protein/vitamin deficiencies.
Sexual Dysfunction may be related to altered body function (neurologic damage and debilitating effects of drug use), changes in appearance, possibly evidenced by progressive interference with sexual functioning, a significant degree of testicular atrophy, gynecomastia, impotence/decreased sperm counts in men; and loss of body hair, thin/soft skin, spider angiomas, and amenorrhea/increase in miscarriages in women.
Family Processes: alcoholism [substance abuse],dysfunction may be related to abuse/history of alcoholism/drug use, inadequate coping skills/lack of problem-solving skills, genetic predisposition/biochemical influences, possibly evidenced by feelings of anger/frustration/responsibility for alcoholic's behavior, suppressed rage, shame/embarrassment, repressed emotions, guilt, vulnerability; disturbed family dynamics/deterioration in family relationships, family denial/rationalization, closed communication systems, triangulating family relationships, manipulation, blaming, enabling to maintain substance use, inability to accept/receive help.

surgery, general
(also refer to *postoperative recovery period*)
Knowledge, deficient [Learning Need] regarding surgical procedure/expectation, postoperative routines/therapy, and self-care needs may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

Anxiety [specify level]/Fear may be related to situational crisis, unfamiliarity with environment, change in health status/ threat of death and separation from usual support systems, possibly evidenced by increased tension, apprehension, decreased self-assurance, fear of unspecific consequences, focus on self, sympathetic stimulation, and restlessness.
Injury, risk for perioperative positioning: risk factors may include disorientation, immobilization, muscle weakness, obesity/edema.
Breathing Pattern, risk for ineffective: risk factors may include chemically induced muscular relaxation, perception/cognitive impairment, decreased energy.
Fluid Volume, risk for deficient: risk factors may include preoperative fluid deprivation, blood loss, and excessive gastrointestinal losses (vomiting/gastric suction).

synovitis (knee)
Pain, acute may be related to inflammation of synovial membrane of the joint with effusion, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Walking, impaired may be related to pain and decreased strength of joint, possibly evidenced by reluctance to attempt movement, inability to move about environment as desired.

syphilis, congenital
(also refer to *sexually transmitted disease—STD*)
Pain, acute may be related to inflammatory process, edema formation, and development of skin lesions, possibly evidenced by irritability/crying that may be increased with movement of extremities and autonomic responses (changes in vital signs).
Skin/Tissue Integrity, impaired may be related to exposure to pathogens during vaginal delivery, possibly evidenced by disruption of skin surfaces and rhinitis.
Growth and Development, delayed may be related to effect of infectious process, possibly evidenced by altered physical growth and delay or difficulty performing skills typical of age group.
Knowledge, deficient [Learning Need] regarding pathophysiology of condition, transmissibility, therapy needs, expected outcomes, and potential complications may be related to caretaker/parental lack of information, misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

syringomyelia
Sensory/Perception, disturbed (specify) may be related to altered sensory perception (neurologic lesion), possibly evidenced by change in usual response to stimuli and motor incoordination.
Anxiety [specify level]/Fear may be related to change in health status, threat of change in role functioning and socioeconomic status, and threat to self-concept, possibly evidenced by increased tension, apprehension, uncertainty, focus on self, and expressed concerns.
Mobility, impaired physical may be related to neuromuscular and sensory impairment, possibly evidenced by decreased muscle strength, control, and mass and impaired coordination.
Self-Care Deficit [specify] may be related to neuromuscular and sensory impairments, possibly evidenced by statement of inability to perform care tasks.

Tay-Sachs disease
Growth and Development, delayed may be related to effects of physical condition, possibly evidenced by altered physical growth, loss of/failure to acquire skills typical of age, flat affect, and decreased responses.
Sensory/Perception, disturbed: visual may be related to neurologic deterioration of optic nerve, possibly evidenced by loss of visual acuity.
Grieving, anticipatory [family] may be related to expected eventual loss of infant/child, possibly evidenced by expressions of distress, denial, guilt, anger, and sorrow; choked feelings; changes in sleep/eating habits; and altered libido.
Powerlessness [family] may be related to absence of therapeutic interventions for progressive/fatal disease, possibly evidenced by verbal expressions of having no control over situation/outcome and depression over physical/mental deterioration.
Spiritual Distress, risk for: risk factors may include challenged belief and value system by presence of fatal condition with racial/religious connotations and intense suffering.
Coping, compromised family may be related to situational crisis, temporary preoccupation with managing emotional conflicts and personal suffering, family disorganization, and prolonged/progressive disease, possibly evidenced by preoccupation with

personal reactions, expressed concern about reactions of other family members, inadequate support of one another, and altered communication patterns.

thrombophlebitis

Tissue Perfusion, ineffective: peripheral may be related to interruption of venous blood flow, venous stasis, possibly evidenced by changes in skin color/temperature over affected area, development of edema, pain, diminished peripheral pulses, slow capillary refill.

Pain, acute/[discomfort] may be related to vascular inflammation/irritation and edema formation (accumulation of lactic acid), possibly evidenced by verbal reports, guarding/distraction behaviors, and self-focus.

Mobility, risk for impaired physical: risk factors may include pain and discomfort and restrictive therapies/safety precautions.

Knowledge, deficient [Learning Need] regarding pathophysiology of condition, therapy/self-care needs, and risk of embolization may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, inaccurate follow-through of instructions, and development of preventable complications.

thrombosis, venous

Refer to *thrombophlebitis*.

thyroidectomy

(also refer to *hyperthyroidism*; *hypoparathyroidism*; *hypothyroidism*)

Airway Clearance, risk for ineffective: risk factors may include hematoma/edema formation with tracheal obstruction, laryngeal spasms.

Communication, impaired verbal may be related to tissue edema, pain/discomfort, and vocal cord injury/laryngeal nerve damage, possibly evidenced by impaired articulation, does not/cannot speak, and use of nonverbal cues/gestures.

Injury, risk for tetany: risk factors may include chemical imbalance/excessive CNS stimulation.

Trauma, risk for head/neck: risk factors may include loss of muscle control/support and position of suture line.

Pain, acute may be related to presence of surgical incision/manipulation of tissues/muscles, postoperative edema, possibly evidenced by verbal reports, guarding/distraction behaviors, narrowed focus, and autonomic responses (changes in vital signs).

thyrotoxicosis

(also refer to *hyperthyroidism*)

Cardiac Output, risk for decreased: risk factors may include uncontrolled hypermetabolic state increasing cardiac workload, changes in venous return and SVR; and alterations in rate, rhythm, and electrical conduction.

Anxiety [specify level] may be related to physiological factors/CNS stimulation (hypermetabolic state and pseudocatecholamine effect of thyroid hormones), possibly evidenced by increased feelings of apprehension, shakiness, loss of control, panic, changes in cognition, distortion of environmental stimuli, extraneous movements, restlessness, and tremors.

Thought Processes, risk for disturbed: risk factors may include physiologic changes (increased CNS stimulation/accelerated mental activity), and altered sleep patterns.

Knowledge, deficient [Learning Need] regarding condition, treatment needs, and potential for complications/crisis situation may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concern, questions, misconceptions; and inaccurate follow-through of instructions.

tic douloureux

Refer to *neuralgia, trigeminal*.

tonsillectomy

Refer to *adenoidectomy*.

tonsillitis

Pain, acute may be related to inflammation of tonsils and effects of circulating toxins, possibly evidenced by verbal reports, guarding/distraction behaviors, reluctance/refusal to swallow, self-focus, and autonomic responses (changes in vital signs).

Hyperthermia may be related to presence of inflammatory process/hypermetabolic state and dehydration, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.

Knowledge, deficient [Learning Need] regardless cause/transmission, treatment needs, and potential complications may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, inaccurate follow-through of instructions, and recurrence of condition.

total joint replacement

Infection, risk for: risk factors may include inadequate primary defenses (broken skin, exposure of joint), inadequate secondary defenses/immunosuppression (long-term corticosteroid use), invasive procedures/surgical manipulation, implantation of foreign body, and decreased mobility.

Mobility, impaired physical may be related to pain and discomfort, musculoskeletal impairment, and surgery/restrictive therapies, possibly evidenced by reluctance to attempt movement, difficulty purposefully moving within the physical environment, reports of pain/discomfort on movement, limited range of motion, and decreased muscle strength/control.

Tissue Perfusion, risk for ineffective: peripheral: risk factors may include reduced arterial/venous blood flow, direct trauma to blood vessels, tissue edema, improper location/dislocation of prosthesis, and hypovolemia.

Pain, acute may be related to physical agents (traumatized tissues/surgical intervention, degeneration of joints, muscle spasms) and psychological factors (anxiety, advanced age), possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

toxemia of pregnancy

Refer to *pregnancy-induced hypertension*.

toxic shock syndrome

(also refer to *septicemia*)

Hyperthermia may be related to inflammatory process/hypermetabolic state and dehydration, possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.

Fluid Volume, deficient [isotonic] may be related to increased gastric losses (diarrhea, vomiting), fever/hypermetabolic state, and decreased intake, possibly evidenced by dry mucous membranes, increased pulse, hypotension, delayed venous filling, decreased/concentrated urine, and hemoconcentration.

Pain, acute may be related to inflammatory process, effects of circulating toxins, and skin disruptions, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).

Skin/Tissue Integrity, impaired may be related to effects of circulating toxins and dehydration, possibly evidenced by development of desquamating rash, hyperemia, and inflammation of mucous membranes.

traction

(also refer to *casts*; *fractures*)

Pain, acute may be related to direct trauma to tissue/bone, muscle spasms, movement of bone fragments, edema, injury to soft tissue, traction/immobility device, anxiety, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, alteration in muscle tone, and autonomic responses (changes in vital signs).

Mobility, impaired physical may be related to neuromuscular/skeletal impairment, pain, psychological immobility, and therapeutic restrictions of movement, possibly evidenced by limited range of motion, inability to move purposefully in environment, reluctance to attempt movement, and decreased muscle strength/control.

Infection, risk for: risk factors may include invasive procedures (including insertion of foreign body through skin/bone), presence of traumatized tissue, and reduced activity with stasis of body fluids.

Diversional Activity, deficient may be related to length of hospitalization/therapeutic intervention and environmental lack of usual activity, possibly evidenced by statements of boredom, restlessness, and irritability.

transient ischemic attack

Tissue Perfusion, ineffective: cerebral may be related to interruption of blood flow (e.g., vasospasm) possibly evidenced by altered mental status, behavioral changes, language deficit, change in motor/sensory response.

Anxiety/Fear may be related to change in health status, threat to self-concept, situational crisis, interpersonal contagion possibly evidenced by expressed concerns, apprehension, restlessness, irritability.

Denial, ineffective, risk for: risk factors may include change in health status requiring change in lifestyle, fear of consequences, lack of motivation.

trichinosis
Pain, acute may be related to parasitic invasion of muscle tissues, edema of upper eyelids, small localized hemorrhages, and development of urticaria, possibly evidenced by verbal reports, guarding/distraction behaviors (restlessness), and autonomic responses (changes in vital signs).
Fluid Volume, deficient [isotonic] may be related to hypermetabolic state (fever, diaphoresis); excessive gastric losses (vomiting, diarrhea); and decreased intake/difficulty swallowing, possibly evidenced by dry mucous membranes, decreased skin turgor, hypotension, decreased venous filling, decreased/concentrated urine, and hemoconcentration.
Breathing Pattern, ineffective may be related to myositis of the diaphragm and intercostal muscles, possibly evidenced by resulting changes in respiratory depth, tachypnea, dyspnea, and abnormal ABGs.
Knowledge, deficient [Learning Need] regarding cause/prevention of condition, therapy needs, and possible complications may be related to lack of information, misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

tuberculosis (pulmonary)
Infection, risk for spread/reactivation: risk factors may include inadequate primary defenses (decreased ciliary action/stasis of secretions, tissue destruction/extension of infection), lowered resistance/suppressed inflammatory response, malnutrition, environmental exposure, insufficient knowledge to avoid exposure to pathogens, or inadequate therapeutic intervention.
Airway Clearance, ineffective may be related to thick, viscous, or bloody secretions; fatigue/poor cough effort, and tracheal/pharyngeal edema, possibly evidenced by abnormal respiratory rate, rhythm, and depth; adventitious breath sounds (rhonchi, wheezes), stridor, and dyspnea.
Gas Exchange, risk for impaired: risk factors may include decrease in effective lung surface, atelectasis, destruction of alveolar-capillary membrane, bronchial edema; thick, viscous secretions.
Activity Intolerance may be related to imbalance between oxygen supply and demand, possibly evidenced by reports of fatigue, weakness, and exertional dyspnea.
Nutrition: less than body requirements, imbalanced may be related to inability to ingest adequate nutrients (anorexia, effects of drug therapy, fatigue, insufficient financial resources), possibly evidenced by weight loss, reported lack of interest in food/altered taste sensation, and poor muscle tone.
Therapeutic Regimen Management: risk for ineffective: risk factors may include complexity of therapeutic regimen, economic difficulties, family patterns of health care, perceived seriousness/benefits (especially during remission), side effects of therapy.

tympanoplasty
Refer to *stapedectomy*.

typhus (tick-borne fever/Rocky Mountain spotted fever)
Hyperthermia may be related to generalized inflammatory process (vasculitis), possibly evidenced by increased body temperature, warm/flushed skin, and tachycardia.
Pain, acute may be related to generalized vasculitis and edema formation, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Tissue Perfusion, ineffective (specify) may be related to reduction/interruption of blood flow (generalized vasculitis/thrombi formation), possibly evidenced by reports of headache/abdominal pain, changes in mentation, and areas of peripheral ulceration/necrosis.

ulcer, decubitus
Skin/Tissue Integrity, impaired may be related to altered circulation, nutritional deficit, fluid imbalance, impaired physical mobility, irritation of body excretions/secretions, and sensory impairments, evidenced by tissue damage/destruction.
Pain, acute may be related to destruction of protective skin layers and exposure of nerves, possibly evidenced by verbal reports, distraction behaviors, and self-focus.
Infection, risk for: risk factors may include broken/traumatized tissue, increased environmental exposure, and nutritional deficits.

ulcer, peptic (acute)
Fluid Volume, deficient [isotonic] may be related to vascular losses (hemorrhage), possibly evidenced by hypotension, tachycardia, delayed capillary refill, changes in mentation, restlessness, concentrated/decreased urine, pallor, diaphoresis, and hemoconcentration.
Tissue Perfusion, risk for altered (specify): risk factors may include hypovolemia.
Fear/Anxiety [specify level] may be related to change in health status and threat of death, possibly evidenced by increased tension, restlessness, irritability, fearfulness, trembling, tachycardia, diaphoresis, lack of eye contact, focus on self, verbalization of concerns, withdrawal, and panic or attack behavior.
Pain, acute may be related to caustic irritation/destruction of gastric tissues, possibly evidenced by verbal reports, distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Knowledge, deficient [Learning Need] regarding condition, therapy/self-care needs, and potential complications may be related to lack of information/recall, misinterpretation, possibly evidenced by statements of concern, questions, misconceptions; inaccurate follow-through of instructions, and development of preventable complications/recurrence of condition.

unconsciousness (coma)
Suffocation, risk for: risk factors may include cognitive impairment/loss of protective reflexes and purposeful movement.
Fluid Volume, risk for deficient/Nutrition: risk for less than body requirements, imbalanced: risk factors may include inability to ingest food/fluids, increased needs/hypermetabolic state.
Self-Care Deficit, total may be related to cognitive impairment and absence of purposeful activity, evidenced by inability to perform ADLs..
Tissue Perfusion, risk for ineffective: cerebral: risk factors may include reduced or interrupted arterial/venous blood flow (direct injury, edema formation, space-occupying lesions), metabolic alterations, effects of drug/alcohol overdose, hypoxia/anoxia.
Infection, risk for: risk factors may include stasis of body fluids (oral, pulmonary, urinary), invasive procedures, and nutritional deficits.

urinary diversion
Skin Integrity, risk for impaired: risk factors may include absence of sphincter at stoma, character/flow of urine from stoma, reaction to product/chemicals, and improperly fitting appliance or removal of adhesive.
Body Image, disturbed related factors may include biophysical factors (presence of stoma, loss of control of urine flow), and psychosocial factors (altered body structure, disease process/associated treatment regimen, such as cancer), possibly evidenced by verbalization of change in body image, fear of rejection/reaction of others, negative feelings about body, not touching/looking at stoma, refusal to participate in care.
Pain, acute may be related to physical factors (disruption of skin/tissues, presence of incisions/drains), biological factors (activity of disease process, such as cancer, trauma), and psychological factors (fear, anxiety), possibly evidenced by verbal reports, self-focusing, guarding/distraction behaviors, restlessness, and autonomic responses (changes in vital signs).
Urinary Elimination, impaired may be related to surgical diversion, tissue trauma, and postoperative edema, possibly evidenced by loss of continence, changes in amount and character of urine, and urinary retention.

urolithiasis (urinary calculi)
Pain, acute may be related to distention, trauma, and edema formation in sensitive tissue or cellular ischemia, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Urinary Elimination, impaired may be related to edema formation and irritation/inflammation of ureteral and bladder tissues, possibly evidenced by urgency, frequency, retention, and hematuria.
Fluid Volume, risk for deficient: risk factors may include stimulation of renal-intestinal reflexes causing nausea, vomiting, and diarrhea; changes in urinary output, postoperative diuresis; and decreased intake.

uterine bleeding, abnormal
Anxiety [specify level] may be related to perceived change in health status and unknown etiology, possibly evidenced by apprehension, uncertainty, fear of unspecified consequences, expressed concerns, and focus on self.

Activity Intolerance may be related to imbalance between oxygen supply and demand/decreased oxygen-carrying capacity of blood (anemia), possibly evidenced by reports of fatigue/weakness.

uterus, rupture of, in pregnancy
Fluid Volume, deficient [isotonic] may be related to excessive vascular losses, possibly evidenced by hypotension, increased pulse rate, decreased venous filling, and decreased urine output.
Cardiac Output, decreased may be related to decreased preload (hypovolemia), possibly evidenced by cold/clammy skin, decreased peripheral pulses, variations in hemodynamic readings, tachycardia, and cyanosis.
Pain, acute may be related to tissue trauma and irritation of accumulating blood, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Anxiety [specify level] may be related to threat of death of self/fetus, interpersonal contagion, physiological response (release of catecholamines), possibly evidenced by fearful/scared affect, sympathetic stimulation, stated fear of unspecified consequences, and expressed concerns.

vaginismus
Pain, acute may be related to muscle spasm and hyperesthesia of the nerve supply to vaginal mucous membrane, possibly evidenced by verbal reports, distraction behaviors, and self-focus.
Sexual Dysfunction may be related to physical and/or psychological alteration in function (severe spasms of vaginal muscles), possibly evidenced by verbalization of problem, inability to achieve desired satisfaction, and alteration in relationship with significant other.

vaginitis
Tissue Integrity, impaired may be related to irritation/inflammation and mechanical trauma (scratching) of sensitive tissues, possibly evidenced by damaged/destroyed tissue, presence of lesions.
Pain, acute may be related to localized inflammation and tissue trauma, possibly evidenced by verbal reports, distraction behaviors, and self-focus.
Knowledge, deficient [Learning Need] regarding hygienic/therapy needs and sexual behaviors/transmission of organisms may be related to lack of information/misinterpretation, possibly evidenced by statements of concern, questions, and misconceptions.

varices, esophageal
(also refer to *ulcer, peptic [acute]*)
Fluid Volume, deficient [isotonic] may be related to excessive vascular loss, reduced intake, and gastric losses (vomiting), possibly evidenced by hypotension, tachycardia, decreased venous filling, and decreased/concentrated urine.
Anxiety [specify level]/Fear may be related to change in health status and threat of death, possibly evidenced by increased tension/apprehension, sympathetic stimulation, restlessness, focus on self, and expressed concerns.

varicose veins
Pain, chronic may be related to venous insufficiency and stasis, possibly evidenced by verbal reports.
Body Image, disturbed may be related to change in structure (presence of enlarged, discolored, tortuous superficial leg veins), possibly evidenced by hiding affected parts and negative feelings about body.
Skin/Tissue Integrity, risk for impaired: risk factors may include altered circulation/venous stasis and edema formation.

venereal disease
Refer to *sexually transmitted disease—STD*.

Wilms' tumor
(also refer to *cancer*; *chemotherapy*)
Anxiety [specify level]/Fear may be related to change in environment and interaction patterns with family members and threat of death with family transmission and contagion of concerns, possibly evidenced by fearful/scared affect, distress, crying, insomnia, and sympathetic stimulation.
Injury, risk for: risk factors may include nature of tumor (vascular, mushy with very thin covering) with increased danger of metastasis when manipulated.

Family Processes, interrupted may be related to situational crisis of life-threatening illness, possibly evidenced by a family system that has difficulty meeting physical, emotional, and spiritual needs of its members, and inability to deal with traumatic experience effectively.
Diversional Activity, deficient may be related to environmental lack of age-appropriate activity (including activity restrictions) and length of hospitalization/treatment, possibly evidenced by restlessness, crying, lethargy, and acting-out behavior.

wound, bullet (depends on site and speed/character of bullet)
Fluid Volume, risk for deficient: risk factors may include excessive vascular losses, altered intake/restrictions.
Pain, acute may be related to destruction of tissue (including organ and musculoskeletal), surgical repair, and therapeutic interventions, possibly evidenced by verbal reports, guarding/distraction behaviors, self-focus, and autonomic responses (changes in vital signs).
Tissue Integrity, impaired may be related to mechanical factors (yaw of projectile and muzzle blast), possibly evidenced by damaged or destroyed tissue.
Infection, risk for: risk factors may include tissue destruction and increased environmental exposure, invasive procedures, and decreased hemoglobin.
Post-Trauma Syndrome, risk for: risk factors may include nature of incident (catastrophic accident, assault, suicide attempt) and possibly injury/death of other(s) involved.

Note: Information appearing in brackets has been added to clarify and facilitate the use of nursing diagnoses.

Appendix N7–5 Nursing Diagnoses Through 2003–2004 in Alphabetical Order

Information appearing in brackets has been added by the authors to clarify and facilitate the use of nursing diagnoses.

A "Risk For" diagnosis is *not* evidenced by signs and symptoms, because the problem has not yet occurred, and nursing interventions are directed at prevention. Therefore, *risk* factors that are present are noted instead.

New nursing diagnoses for 2003–2004 appear in Appendix N7–3.

ACTIVITY INTOLERANCE [SPECIFY LEVEL]

Diagnostic Division: Activity / Rest

Definition: Insufficient physiological or psychological energy to endure or complete required or desired daily activities.

RELATED FACTORS

Generalized weakness; Sedentary lifestyle; Imbalance between oxygen supply and demand; Bedrest or immobility; [Cognitive deficits/emotional status; secondary to underlying disease process/depression]; [Pain, vertigo, extreme stress]

DEFINING CHARACTERISTICS

Subjective

Report of fatigue or weakness; Exertional discomfort or dyspnea; [Verbalizes no desire and/or lack of interest in activity]

Objective

Abnormal heart rate or blood pressure response to activity; Electrocardiographic changes reflecting dysrhythmias or ischemia; [Pallor, cyanosis]

ACTIVITY INTOLERANCE, RISK FOR

Diagnostic Division: Activity / Rest

Definition: At risk of experiencing insufficient physiologic or psychologic energy to endure or complete required or desired daily activities.

RISK FACTORS

History of previous intolerance; Presence of circulatory/respiratory problems; Deconditioned status; Inexperience with the activity; [Diagnosis of progressive disease state/

debilitating condition such as cancer, multiple sclerosis; extensive surgical procedures]; [Verbalized reluctance/inability to perform expected activity]

ADJUSTMENT, IMPAIRED

Diagnostic Division: Ego Integrity

Definition: Inability to modify life style/behavior in a manner consistent with a change in health status.

RELATED FACTORS
Disability or health status change requiring change in life style; Multiple stressors; intense emotional state; Low state of optimism; negative attitudes toward health behavior; lack of motivation to change behaviors; Failure to intend to change behavior; Absence of social support for changed beliefs and practices; [Physical and/or learning disability]

DEFINING CHARACTERISTICS

Subjective
Denial of health status change; Failure to achieve optimal sense of control

Objective
Failure to take actions that would prevent further health problems; Demonstration of non-acceptance of health status change

AIRWAY CLEARANCE, INEFFECTIVE

Diagnostic Division: Respiration

Definition: Inability to clear secretions or obstructions from the respiratory tract to maintain a clear airway.

RELATED FACTORS
Environmental
Smoking; smoke inhalation; second-hand smoke.

Obstructed Airway
Airway spasm; retained secretions; excessive mucus; presence of artificial airway; foreign body in airway; secretions in the bronchi; exudate in the alveoli

Physiological
Neuromuscular dysfunction; hyperplasia of the bronchial walls; chronic obstructive pulmonary disease; infection; asthma; allergic airways

DEFINING CHARACTERISTICS

Subjective
Dyspnea

Objective
Diminished or adventitious breath sounds (rales, crackles, rhonchi, wheezes); Cough, ineffective or absent; sputum; Changes in respiratory rate and rhythm; Difficulty vocalizing; Wide-eyed; restlessness; Orthopnea; Cyanosis

ALLERGY RESPONSE, LATEX

Diagnostic Division: Safety

Definition: An allergic response to natural latex rubber products.

RELATED FACTORS
No immune mechanism response [although this is true of irritant and allergic contact dermatitis, type I/immediate reaction is a true allergic response]

DEFINING CHARACTERISTICS
Type I Reactions
Immediate [hypersensitivity; IgE-mediated reaction] Immediate reaction (< 1 hour) to latex proteins (can be life threatening); contact urticaria progressing to generalized symptoms; edema of the lips, tongue, uvula, and/or throat; shortness of breath, tightness in chest, wheezing, bronchospasm leading to respiratory arrest; hypotension,

syncope, cardiac arrest; may also include: *Orofacial characteristics* - edema of sclera or eyelids; erythema and/or itching of the eyes; tearing of the eyes; nasal congestion, itching, and/or erythema; rhinorrhea; facial erythema; facial itching; oral itching; *Gastrointestinal characteristics* - abdominal pain; nausea; Generalized characteristics - flushing; general discomfort; generalized edema; increasing complaint of total body warmth; restlessness

Type IV Reactions [chemical and delayed-type hypersensitivity]
Delayed onset (hours); eczema; irritation; reaction to additives (e.g., thiurams, carbamates) causes discomfort; redness

Irritant [contact dermatitis] Reactions
Erythema; [dry, crusty, hard bumps]; chapped or cracked skin; blisters

ALLERGY RESPONSE, RISK FOR LATEX

Diagnostic Division: Safety

Definition: At risk for allergic response to natural latex rubber products.

RISK FACTORS
History of reactions to latex (e.g., balloons, condoms, gloves); allergies to bananas, avocados, tropical fruits, kiwi, chestnuts, poinsettia plants; History of allergies and asthma; Professions with daily exposure to latex (e.g., medicine, nursing, dentistry); Conditions needing continuous or intermittent catheterization; Multiple surgical procedures, especially from infancy (e.g., spina bifida)

ANXIETY

Diagnostic Division: Ego Integrity

Definition: A vague uneasy feeling of discomfort or dread accompanied by an autonomic response; the source is often nonspecific or unknown to the individual; a feeling of apprehension caused by anticipation of danger. It is an altering signal that warns of impending danger and enables the individual to take measures to deal with threat.

RELATED FACTORS
Unconscious conflict about essential [beliefs]/goals and values of life; Situational/maturational crises; Stress; Familial association/heredity; Interpersonal transmission/contagion; Threat to self-concept [perceived or actual]; [unconscious conflict]; Threat of death [perceived or actual]; Threat to or change in health status [progressive/debilitating disease, terminal illness], interaction patterns, role function/status, environment [safety], economic status; Unmet needs; Exposure to toxins; Substance abuse; [Positive or negative self talk]; [Physiological factors, such as hyperthyroidism, pheochromocytoma, drug therapy including steroids, and so on]

DEFINING CHARACTERISTICS

Subjective
Behavioral
Expressed concerns due to change in life events

Affective
Regretful; scared; rattled; overexcited; painful and persistent increased helplessness; uncertainty; increased wariness; focus on self; feelings of inadequacy; fearful; distressed; apprehension; anxious; jittery; [sense of impending doom]; [hopelessness]

Cognitive
Fear of unspecific consequences; awareness of physiologic symptoms

Physiological
Shakiness; worried; regretful; dry mouth (sympathetic); tingling in extremities (parasympathetic); heart pounding (sympathetic); nausea (parasympathetic); abdominal pain (parasympathetic); diarrhea (parasympathetic); urinary hesitancy (parasympathetic); urinary frequency (parasympathetic); faintness (parasympathetic); weakness (sympathetic); decreased pulse (parasympathetic); respiratory difficulties (sympathetic); fatigue (parasympathetic); sleep disturbance (parasympathetic); [chest, back, neck pain]

Objective
Behavioral
Poor eye contact; glancing about; scanning and vigilance; extraneous movement (e.g., foot shuffling, hand/arm movements); fidgeting; restlessness; diminished productivity; [crying/tearfulness]; [pacing/purposeless activity]; [immobility]

Affective
Increased wariness; focus on self; irritability; overexcited; anguish; painful and persistent increased helplessness

Physiological
Voice quivering; trembling/hand tremors; increased tension; facial tension; increased pulse; increased perspiration; cardiovascular excitation (sympathetic); facial flushing (sympathetic); superficial vasoconstriction (sympathetic); increased blood pressure (sympathetic); twitching (sympathetic); increased reflexes (sympathetic); urinary urgency (parasympathetic); decreased blood pressure (parasympathetic); insomnia; anorexia (sympathetic); increased respiration (sympathetic)

Cognitive
Preoccupation; impaired attention; difficult concentrating; forgetfulness; diminished ability to problem-solve; diminished learning ability; rumination; tendency to blame others; blocking of thought; confusion; decreased perceptual field.

ANXIETY, DEATH

Diagnostic Division: Ego Integrity

Definition: The apprehension, worry, or fear related to death or dying.

RELATED FACTORS
To be developed by NANDA

DEFINING CHARACTERISTICS

Subjective
Fear of: developing terminal illness, the process of dying, loss of physical and/or mental abilities when dying, premature death because it prevents the accomplishment of important life goals, leaving family alone after death, delayed demise; Negative death images or unpleasant thought about any event related to death or dying; anticipated pain related to dying; Powerlessness related to dying; total loss of control over any apect of one's own death; Worrying about the impact of one's own death on significant others, being the cause of other's grief and suffering; Concerns of overworking the caregiver as terminal illness incapacitates itself; Concern about meeting one's creator or feeling doubtful about the existence of a god or higher being; Denial of one's own mortality or impending death

Objective
Deep sadness; (refer to nursing diagnosis Grieving, anticipatory)

ASPIRATION, RISK FOR

Diagnostic Division: Respiration

Definition: At risk for entry of gastrointestinal secretions, oropharyngeal sections, [or exogenous food] or solids or fluids into tracheobronchial passages [due to dysfunction or absence of normal protective mechanisms].

RISK FACTORS
Reduced level of consciousness; Depressed cough and gag reflexes; Presence of tracheostomy or endotracheal tube; [Overinflated tracheostomy/endotracheal tube cuff]; [Inadequate tracheostomy/endotracheal tube cuff inflation]; [Presence of] gastrointestinal tubes; Tube feedings/medication administration; Situation hindering elevation of upper body [weakness, paralysis]; Increased intragastric pressure; Increased gastric residual; Decreased gastrointestinal motility; Delaying gastric emptying; Impaired swallowing [owing to inability of the epiglottis and true vocal cords to move to close off trachea]; Facial/oral/neck surgery or trauma; Wired jaws; Incomplete lower esophageal sphincter [hiatal hernia or other esophageal disease affecting stomach valve function]

ATTACHMENT, RISK FOR IMPAIRED PARENT/INFANT/CHILD

Diagnostic Division: Social Interaction

Definition: Disruption of the interactive process between parent/significant other and infant that fosters the development of a protective and nurturing reciprocal relationship.

RISK FACTORS

Inability of parents to meet the personal needs; Anxiety associated with the parent role; Substance abuse; Premature infant, ill infant/child who is unable to effectively initiate parental contact due to altered behavioral organization; Separation; physical barriers; Lack of privacy; [Parents who themselves experienced altered attachment]; [Uncertainty of paternity; conception as a result of rape/sexual abuse]; [Difficult pregnancy and/or birth (actual or perceived)]

AUTONOMIC DYSREFLEXIA

Diagnostic Division: Circulation

Definition: Life-threatening, uninhibited sympathetic response of the nervous system to a noxious stimulus after a spinal cord injury at T7 or above.

RELATED FACTORS

Bladder or bowel distention [catheter insertion, obstruction, irrigation]; Skin irritation; Lack of patient and caregiver knowledge; [Sexual excitation]; [Environmental temperature extremes]

DEFINING CHARACTERISTICS

Individual with spinal cord injury (T7 or above) with:

Subjective

Headache (a diffuse pain in different portions of the head and not confined to any nerve distribution area); Paresthesia; chilling; blurred vision; chest pain; metallic taste in mouth; nasal congestion

Objective

Paroxysmal hypertension (sudden periodic elevated blood pressure where systolic pressure is over 140 mm Hg and diastolic is above 90 mm Hg); Bradycardia or tachycardia (pulse rate of less than 60 or over 100 beats per minute); Diaphoresis (above the injury); red splotches on skin (above the injury); pallor (below the injury); Horner's syndrome (contraction of the pupil, partial ptosis of the eyelid, enophthalmos and sometimes loss of sweating over the affected side of the face); conjunctival congestion; Pilomotor reflex (gooseflesh formation when skin is cooled)

AUTONOMIC DYSREFLEXIA, RISK FOR

Diagnostic Division: Circulation

Definition: At risk for life threatening, uninhibited response of the sympathetic nervous system post spinal shock, in an individual with a spinal cord injury or lesion at T6 or above (has been demonstrated in clients with injuries at T7 and T8)

RISK FACTORS

Cardiac/Pulmonary Problems: pulmonary emboli; Gastrointestinal Problems: distention; constipation; enemas; stimulation (e.g., digital, instrumentation, surgery); gastrointestinal system pathology; gastric ulcers; esophageal reflux; Neurological Problems: painful or irritating stimuli below the level of injury; Regulatory Problems: temperature fluctuations [internal/environmental]; Reproductive [And Sexuality] Problems: menstruation, sexual intercourse, ejaculation; Integumentary Problems: cutaneous stimulations (e.g., pressure ulcer, ingrown toenail, dressings, burns, rash); heterotrophic bone; Situational Problems: positioning; range of motion exercises; pregnancy; labor and delivery; drug reactions (e.g., decongestants, sympathomimetics, vasoconstrictors, narcotic withdrawal); constrictive clothing; fractures; deep vein thrombosis; ovarian cyst; surgical procedures; Urological Problems: bladder distention; spasm; instrumentation; infection; urethritis; epididymitis

BODY IMAGE, DISTURBED

Diagnostic Division: Ego Integrity

Definition: Confusion in mental picture of one's physical self.

RELATED FACTORS

Biophysical illness; trauma or injury; surgery [mutilation pregnancy]; illness treatment [change caused by biochemical agents (drugs), dependence on machine]; Psychosocial; Cognitive/perceptual; developmental changes; Cultural or spiritual; [Significance of body part or functioning with regard to age, sex, developmental level, or basic human needs]; [Maturational changes]

DEFINING CHARACTERISTICS

Subjective

Verbalization of feelings/perception that reflect an altered view of one's body in appearance, structure, or function; change in lifestyle; Fear of rejection or of reaction by others; Focus on past strength, function, or appearance; Negative feelings about body (e.g., feelings of helplessness, hopelessness, or powerlessness); [depersonalization/grandiosity]; Preoccupation with change or loss; Refusal to verify actual change; Emphasis on remaining strengths, heightened achievement; Personalization of part or loss by name; Depersonalization of part or loss by impersonal pronouns

Objective

Missing body part; Actual change in structure and/or function; Nonverbal response to acutual or perceived change in structure and/or function; behaviors of avoidance, monitoring, or acknowledgment of one's body; Not looking at/not touching body part; Trauma to nonfunctioning part; Change in ability to estimate spatial relationshp of body to environment; Extension of body boundary to incorporate environmental objects; Hiding or overexposing body part (intentional or unintentional); Change in social involvement; [Aggression; low frustration tolerance level]

BODY TEMPERATURE, RISK FOR IMBALANCED

Diagnostic Division: Safety

Definition: At risk for failure to maintain body temperature within normal range.

RISK FACTORS

Extremes of age; Extremes of weight; Exposure to cold/cool or warm/hot environments; Dehydration; Inactivity or vigorous activity; Medications causing vasoconstriction/vasodilation, altered metabolic rate, sedation, [use or overdose of certain drugs or exposure to anesthesia]; Inappropriate clothing for environmental temperature; Illness or trauma affecting temperature regulation; [e.g., infections, systemic or localized; neoplasms, tumors, collagen/vascular disease]

BOWEL INCONTINENCE

Diagnostic Division: Elimination

Definition: Change in normal bowel habits characterized by involuntary passage of stool.

RELATED FACTORS

Self-care deficit—toileting; impaired cognition; immobility; environmental factors (e.g., inaccessible bathroom); Dietary habits; medications; laxative abuse; Stress; Incomplete emptying of bowel; impaction; chronic diarrhea; General decline in muscle tone; abnormally high abdominal or intestinal pressure; Impaired reservoir capacity; Rectal sphincter abnormality; loss of rectal sphincter control; upper/lower motor nerve damage

DEFINING CHARACTERISTICS

Subjective

Recognizes rectal fullness but reports inability to expel formed stool; Urgency; Inability to delay defecation; Self-report of inability to feel rectal fullness

Objective

Constant dribbling of soft stool; Fecal odor; Fecal staining of clothing and/or bedding; Red perianal skin; Inability to recognize/inattention to urge to defecate

BREASTFEEDING, EFFECTIVE

Diagnostic Division: Food / Fluid

Definition: Mother-infant dyad/family exhibits adequate proficiency and satisfaction with breastfeeding process.

RELATED FACTORS

Basic breastfeeding knowledge; Normal breast structure; Normal infant oral structure; Infant gestational age greater than 34 weeks; Support sources [available]; Maternal confidence

DEFINING CHARACTERISTICS

Subjective

Maternal verbalization of satisfaction with the breastfeeding process

Objective

Mother able to position infant at breast to promote a successful latch-on response; Infant is content after feedings; Regular and sustained sucking at the breast (8 to 10 times/24 hours); Appropriate infant weight patterns for age; Effective mother/infant communication pattern (infant cues, maternal interpretation and response); Signs and/or symptoms of oxytocin release (let-down or milk ejection reflex); Adequate infant elimination patterns for age; [soft stools; more than 6 wet diapers per day of unconcentrated urine]; Eagerness of infant to nurse

BREASTFEEDING, INEFFECTIVE

Diagnostic Division: Food / Fluid

Definition: Dissatisfaction or difficulty a mother, infant, or child experiences with the breastfeeding process.

RELATED FACTORS

Prematurity; Infant anomaly; Poor infant sucking reflex; Infant receiving [numerous or repeated] supplemental feedings with artificial nipple; Maternal anxiety or ambivalence; Knowledge deficit; Previous history of breastfeeding failure; Interruption in breastfeeding; Nonsupportive partner/family; Maternal breast anomaly; Previous breast surgery [painful nipples/breat engorgement]

DEFINING CHARACTERISTICS

Subjective

Unsatisfactory breastfeeding process; Persistence of sore nipples beyond the first week of breastfeeding; Insufficient emptying of each breast per feeding; Actual or perceived inadequate milk supply

Objective

Observable signs of inadequate infant intake [decrease in number of wet diapers, inappropriate weight loss or inadequate gain]; Nonsustained or insufficient opportunity for suckling at the breast; Infant inability [failure] to attach on to maternal breast correctly; Infant arching and crying at the breasts; resistant latching on; Infant exhibiting fussiness and crying within the first hour after breastfeeding; Unresponsive to other comfort measures; No observable signs of oxytocin release

BREASTFEEDING, INTERRUPTED

Diagnostic Division: Food / Fluid

Definition: Break in the continuity of the breastfeeding process as a result of inability or inadvisability to put a baby to breast for feeding.

RELATED FACTORS

Maternal or infant illness; Prematurity; Maternal employment; Contraindications to breastfeeding (e.g., drugs, true breast milk jaundice); Need to abruptly wean infant

DEFINING CHARACTERISTICS

Subjective

Infant does not receive nourishment at the breast for some or all of feedings; Maternal desire to maintain lactation and provide (or eventually provide) her breast milk for

her infant's nutritional needs; Lack of knowledge regarding expression and storage of breast milk

Objective
Separation of mother and infant

BREATHING PATTERN, INEFFECTIVE

Diagnostic Division: Respiration

Definition: Inspiration and/or expiration that does not provide adequate ventilation.

RELATED FACTORS
Neuromuscular dysfunction; spinal cord injury; neurological immaturity; Musculoskeletal impairment; bony/chest wall deformity; Anxiety; Pain; Perception/cognitive impairment; Decreased energy/fatigue; respiratory muscle fatigue; Body position; obesity; Hyperventilation; hypoventilation syndrome; [alteration of patient's normal O_2: CO_2 ratio (e.g, O_2 therapy in COPD)]

DEFINING CHARACTERISTICS

Subjective
Shortness of breath

Objective
Dyspnea; orthopnea; respiratory rate (adults [ages 14 or greater] ≤11 or > 24, infants <25 or >60, ages 1–4 <20 or >30, ages 5–14 <15 or >25); depth of breathing (adults VT 500 ml at rest, infants 6–8 ml/kilo); Timing ratio; prolonged expiration phases; pursed lip breathing; Decreased minute ventilation; vital capacity; Decreased inspiratory/expiratory pressure; Use of accessory muscles to breathe; assumption of 3-point position; Altered chest excursion; [paradoxical breathing patterns]; Nasal flaring [grunting]; Increased anterior-posterior diameter

CARDIAC OUTPUT, DECREASED

Diagnostic Division: Circulation

Definition: Inadequate blood pumped by the heart to meet the metabolic demands of the body.

NOTE: In a hypermetabolic state, although cardiac output may be within normal range, it may still be inadequate to meet the needs of the body's tissues. Cardiac output and tissue perfusion are interrelated, although there are differences. When cardiac output is decreased, tissue perfusion problems will develop; however, tissue perfusion problems can exist without decreased cardiac output.

RELATED FACTORS
To be developed by NANDA (Mechanical: Alteration in preload [e.g., decreased venous return, altered myocardial contractility]; afterload [e.g., alteration in systemic vascular resistance]; inotropic changes in heart. Electrical: Alterations in rate, rhythm, conduction. Structural [e.g., ventricular-septal rupture, ventricular aneurysm, papillary muscle rupture, valvular disease.])

NOTE: These factors were identified when this diagnosis was originally accepted and have been retained here to assist the user until NANDA completes its work.

DEFINING CHARACTERISTICS

Subjective
Fatigue; Dyspnea; Orthopnea/PND; Chest pain, [angina]; [syncope; vertigo]

Objective
Variations in blood pressure readings; decreased CO by thermodilution method; Ejection fraction 40%; Color changes, skin [and mucous membranes (cyanosis, pallor)]; Cold, clammy skin; Decreased peripheral pulses; Increased heart rate; S_3 or S_4, [gallop rhythm]; [Dys]arrhythmias, electrocardiogram (ECG) changes; Jugular vein distention (JVD); Oliguria; [anuria]; Rales [crackles]; wheezing; [frothy sputum]; cough; Restlessness; Weight gain; edema; Elevated pulmonary artery pressures; Increased respiratory rate; use of accessory muscles; Abnormal chest x-ray (pulmonary vascular cognition); Abnormal chest x-ray (pulmonary vascular congestion); Abnormal cardiac enzymes; Mixed venous O_2 (SaO_2); Altered mental status

CAREGIVER ROLE STRAIN

Diagnostic Division: Social Interaction

Definition: Difficulty in performing the family caregiver role.

RELATED FACTORS

Physiological

Illness severity of the care receiver; Addiction or codependency of care receiver; Discharge of family member with significant home care needs [e.g., premature birth, congenital defect]; Caregiver health impairment; Unpredictable illness course or instability in the care receiver's health; Increasing care needs and/or dependency

Individual

Illness chronicity; Instability of care receiver's health; Problem behaviors; Psychological or cognitive problems in care receiver

Roles and Relationships

Unrealistic expectations of caregiver by care receiver; Change in relationship; History of marginal family coping, family dysfunction

Caregiver

Ongoing changes in activities; amount of activities; Unpredictability of care situation; 24 hour care responsibility; Inability to fulfill one's own or other's expectations; unrealistic expectations of self; Marginal caregiver's coping patterns; Addiction or codependency; psychological or cognitive problems

Situational

Presence of abuse or violence; Inadequate physical environment for providing care (e.g., housing, transportation, community services, equipment); Family/caregiver isolation; Inexperience with caregiving; Caregiver's competing role commitments; Complexity/amount of caregiving tasks

Social

Alienation from family, friends, and coworkers; Insufficient recreation

Resources

Insufficient information, finances; Inadequate transportation, equipment for providing care, community services; Lack of support from significant others, respite resources, recreational resources; Caregiver is not developmentally ready for caregiver role

NOTE: The presence of this problem may encompass other numerous problems/high-risk concerns such as Diversional Activity, deficient; Sleep Pattern, disturbed; Fatigue; Anxiety; Coping, ineffective; Conflict, Decisional (specify); Denial, ineffective; Grieving, anticipatory/[actual]; Hopelessness; Powerlessness; Spiritual Distress; Health Maintenance, ineffective; Home Maintenance, impaired; Sexuality Patterns, ineffective; Family Coping: readiness for enhanced; Family Processes, interrupted; Social Isolation. Careful attention to data gathering will identify and clarify the client's specific needs, which can then be coordinated under this single diagnostic label.

DEFINING CHARACTERISTICS

Subjective

Apprehension about possible institutionalization of care receiver, the future regarding care receiver's health and the caregiver's ability to provide care, care receiver's care when caregiver is ill or deceased; Altered caregiving activities; Altered caregiver health status (e.g., hypertension, cardiovascular disease, diabetes, headaches, gastrointestinal upset, weight change, rash); [Care receiver reports problems with care]

Objective

Difficulty performing required activities; Inability to complete caregiving tasks; Preoccupation with care routine; [Disorderly surroundings, tasks not done (e.g., bills unpaid)]

NOTE: [Although objective characteristics were not included in the NANDA diagnosis, if caregiver is in a state of denial, subjective statements may not be made by caregiver; however, statements of care receiver and observations of family members and/or other health care providers may indicate presence of problem.]

CAREGIVER ROLE STRAIN, RISK FOR

Diagnostic Division: Social Interaction

Definition: Caregiver is vulnerable for felt difficulty in performing the family caregiver role.

RISK FACTORS

Pathophysiological

Illness severity of the care receiver; Addiction or codependency; Premature birth/Congenital defect; Discharge of family member with significant home care needs; Caregiver health impairment; Unpredictable illness course or instability in the care receiver's health; Caregiver is female; Psychological or cognitive problems in care receiver

Developmental

Caregiver is not developmentally ready for caregiver role (e.g., young adult needing to provide care for a middle-aged parent); Developmental delay or retardation of the care receiver or caregiver

Psychological

Marginal family adaptation or dysfunction prior to the caregiving situation; Marginal caregiver's coping patterns; Past history of poor relationship between caregiver and care receiver; Care receiver exhibits deviant, bizarre behavior; Caregiver is spouse

Situational

Presence of abuse or violence; Presence of situational stressors that normally affect families, such as significant loss, disaster, or crisis, poverty or economic vulnerability, major life events (e.g., birth, hospitalization, leaving home, returning home, marriage, divorce, [change in] employment, retirement, death); Duration of caregiving required; Inadequate physical environment for providing care (e.g., housing, transportation, community services, equipment); Family/caregiver isolation; Lack of respite and recreation for caregiver; Inexperience with caregiving; Caregiver's competing role commitments; Complexity/amount of caregiving tasks

COMMUNICATION, IMPAIRED VERBAL

Diagnostic Division: Social Interaction

Definition: Decreased, delayed, or absent ability to receive, process, transmit, and use a system of symbols.

RELATED FACTORS

Decrease in circulation to brain, brain tumor; Anatomic deficit (e.g., cleft palate, alteration of the neuromuscular visual system, auditory system, or phonatory apparatus); Difference related to developmental age; Physical barrier (tracheostomy, intubation); Physiological conditions [e.g., dyspnea]; alteration of central nervous system; weakening of musculoskeletal system; Psychological barriers (e.g., psychosis, lack of stimuli); emotional conditions [depression, panic, anger[; stress; Environmental barriers; Cultural difference; Lack of information; Side effects of medication; Alteration of self-esteem or self-concept; Altered perceptions; Absence of significant others

DEFINING CHARACTERISTICS

Subjective

[Reports of difficulty expressing self]

Objective

Unable to speak dominant language; Speaks or verbalizes with difficulty; Does not or cannot speak; Disorientation in the three spheres of time, space, person; Stuttering; slurring; Dyspnea; Difficulty forming words or sentences (e.g., aphonia, dyslalia, dysarthria); Difficulty expressing thought verbally (e.g., aphasia, dysphasia, apraxia, dyslexia); Inappropriate verbalization (incessant, loose association of ideas, flight of ideas); Difficulty in comprehending and maintaining the usual communicating pattern; Absence of eye contact or difficulty in selective attending; partial or total visual deficit; Inability or difficulty in use of facial or body expressions; Willful refusal to speak [Inability to modulate speech]; [Message inappropriate to content]; [Use of nonverbal cues (e.g., pleading eyes, gestures, turning away)]; [Frustration, anger, hostility]

COMMUNICATION, READINESS FOR ENHANCED

Diagnostic Division: Social Interaction

Definition: A pattern of exchanging information and ideas with others that is sufficient for meeting one's needs and life's goals and can be strengthened.

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance communication; Expresses thoughts and feelings; Expresses satisfaction with ability to share information and ideas with others

Objective
Able to speak or write a language; Forms words, phrases, and language; Uses and interprets nonverbal cues appropriately

CONFLICT, DECISIONAL (Specify)

Diagnostic Division: Ego Integrity

Definition: Uncertainty about course of action to be taken when choice among competing actions involves risk, loss, or challenge to personal life values.

RELATED FACTORS
Unclear personal values/beliefs; perceived threat to value system; Lack of experience or interference with decision making; Lack of relevant information, multiple or divergent sources of information; Support system deficit; [Age, developmental state]; [Family system, sociocultural factors]; [Cognitive, emotional, behavioral level of functioning]

DEFINING CHARACTERISTICS

Subjective
Verbalized uncertainty about choices or of undesired consequences of alternative actions being considered; Verbalized feelings of distress or questioning personal values and beliefs while attempting a decision

Objective
Vacillation between alternative choices; delayed decision-making; Self-focusing; Physical signs of distress or tension (increased heart rate, increased muscle tension, restlessness, and so on)

CONFLICT, PARENTAL ROLE

Diagnostic Division: Social Interaction

Definition: Parent experience of role confusion and conflict in response to crisis.

RELATED FACTORS
Separation from child due to chronic illness [/disability]; Intimidation with invasive or restrictive modalities (e.g., isolation, intubation), specialized care centers, policies; Home care of a child with special needs (e.g., apnea monitoring, postural drainage, hyperalimentation); Change in marital status; Interruptions of family life due to home care regimen (treatments, caregiver's lack of respite)

DEFINING CHARACTERISTICS

Subjective
Parent(s) express concerns/feelings of inadequacy to provide for child's physical and emotional needs during hospitalization or in the home; Parent(s) express concerns about changes in parental role, family functioning, family communication, family health; Parent(s) express concern about perceived loss of control over decisions relating to their child; Parent(s) verbalize feelings of guilt, anger, fear, anxiety, and/or frustration about effect of child's illness on family process

Objective
Demonstrated disruption in caretaking routines; Reluctance to participate in usual caretaking activities, even with encouragement and support; Demonstrated feelings of

guilt, anger, fear, anxiety, and/or frustration about effect of child's illness on family process

CONFUSION, ACUTE

Diagnostic Division: Neurosensory

Definition: The abrupt onset of a cluster of global, transient changes and disturbances in attention, cognition, psychomotor activity level of consciousness, and/or sleep/wake cycle.

RELATED FACTORS
Over 60 years of age; Dementia; Alcohol abuse, drug abuse; Delirium [including febrile epilepticum (following or instead of an epileptic attack), toxic and traumatic]; [Medication reaction/interaction; anesthesia/surgery; metabolic imbalances]; [Exacerbation of a chronic illness, hypoxemia]; [Severe pain]; [Sleep deprivation]

NOTE: Although no time frame is presented to aid in differentiating acute from chronic confusion, the definition of chronic confusion identifies an irreversible state. Therefore, our belief is that acute confusion is potentially reversible.

DEFINING CHARACTERISTICS

Subjective
Hallucinations [Visual/auditory]; [Exaggerated emotional responses]

Objective
Fluctuation in cognition; Fluctuation in sleep/wake cycle; Fluctuation in level of consciousness; Fluctuation in psychomotor activity [tremors, body movement]; Increased agitation or restlessness; Misperceptions [inappropriate responses]; Lack of motivation to initiate and/or follow through with goal-directed or purposeful behavior

CONFUSION, CHRONIC

Diagnostic Division: Neurosensory

Definition: An irreversible, long-standing, and/or progressive deterioration of intellect and personality characterized by decreased ability to interpret environmental stimuli, decreased capacity for intellectual thought processes, and manifested by disturbances of memory, orientation, and behavior.

RELATED FACTORS
Alzheimer's disease [dementia of Alzheimer's type]; Korsakoff's psychosis; Multi-infarct dementia; Cerebrovascular accident; Head injury

DEFINING CHARACTERISTICS
Objective
Clinical evidence of organic impairment; Altered interpretation/response to stimuli; Progressive/long-standing cognitive impairment; No change in level of consciousness; Impaired socialization; Impaired memory (short term, long term); Altered personality

CONSTIPATION

Diagnostic Division: Elimination

Definition: A decrease in a person's normal frequency of defecation accompanied by difficult or incomplete passage of stool and/or passage of excessively hard, dry stool.

RELATED FACTORS
Functional
Irregular defecation habits; inadequate toileting, (e.g., timeliness, positioning for defecation, privacy); Insufficient physical activity; abdominal muscle weakness; Recent environmental changes; Habitual denial/ignoring of urge to defecate

Psychological
Emotional stress; depression; mental confusion

Pharmacological
Antilipemic agents; laxative overdose; calcium carbonate; aluminum-containing antacids; nonsteroidal anti-inflammatory agents; opiates; anticholinergics; diuretics; iron

salts; phenothiazines; sedatives; sympathomimetics; bismuth salts; antidepressants; calcium channel blockers

Mechanical
Hemorrhoids; pregnancy; obesity; Rectal abscess or ulcer; anal fissures; prolapse; anal strictures; rectocele; Prostate enlargement; postsurgical obstruction; Neurological impairment; megacolon (Hirschsprung's disease); tumors; Electrolyte imbalance

Physiological
Poor eating habits; change in usual foods and eating patterns; insufficient fiber intake; insufficient fluid intake; dehydration; Inadequate dentition or oral hygiene; Decreased motility of gastrointestinal tract

DEFINING CHARACTERISTICS

Subjective
Change in bowel pattern; unable to pass stool; decreased frequency; decreased volume of stool; Change in usual foods and eating patterns; increased abdominal pressure; feeling of rectal fullness or pressure; Abdominal pain; pain with defecation; nausea and /or vomiting; headache; indigestion; generalized fatigue

Objective
Dry, hard, formed stool; Straining with defecation; Hypoactive or hyperactive bowel sounds; change in abdominal growling (borborygmi); Distended abdomen; abdominal tenderness with or without palpable muscle resistance; Percussed abdominal dullness; Presence of soft paste-like stool in rectum; oozing liquid stool; bright red blood with stool; dark or black or tarry stool; Severe flatus; anorexia; Atypical presentations in older adults (e.g., change in mental status, urinary incontinence, unexplained falls, elevated body temperature)

CONSTIPATION, PERCEIVED

Diagnostic Division: Elimination

Definition: Self-diagnosis of constipation and abuse of laxatives, enemas, and suppositories to ensure a daily bowel movement.

RELATED FACTORS
Cultural/family health beliefs; Faulty appraisal; Impaired thought processes; [Long-term expectations/habits]

DEFINING CHARACTERISTICS

Subjective
Expectation of a daily bowel movement with the resulting overuse of laxatives, enemas, and suppositories; Expected passage of stool at same time every day

CONSTIPATION, RISK FOR

Diagnostic Division: Elimination

Definition: At risk for a decrease in a person's normal frequency of defecation accompanied by difficult or incomplete passage of stool and/or passage of excessively hard, dry stool.

RISK FACTORS
Functional
Irregular defecation habits; inadequate toileting (e.g., timeliness, positioning for defecation, privacy); Insufficient physical activity; abdominal muscle weakness; Recent environmental changes; Habitual denial/ignoring of urge to defecate

Psychological
Emotional stress; mental confusion; depression

Physiological
Change in usual foods and eating patterns; insufficient fiber/fluid intake; dehydration; poor eating habits; Inadequate dentition or oral hygiene; Decreased motility of gastrointestinal tract

Pharmacological
Phenothiazines; nonsteroidal anti-inflammatory agents; sedatives; aluminum-containing antacids; laxative overuse; iron salts; anticholinergics; antidepressants; anticon-

vulsants; antilipemic agents; calcium channel blockers; calcium carbonate; diuretics; sympathomimetics; opiates; bismuth salts

Mechanical
Hemorrhoids; pregnancy; obesity; Rectal abscess or ulcer; anal stricture; anal fissures; prolapse; rectocele; Prostate enlargement; postsurgical obstruction; Neurological impairment; megacolon (Hirschsprung's disease); tumors; Electrolyte imbalance

COPING, COMPROMISED FAMILY

Diagnostic Division: Social Interaction

Definition: A usually supportive primary person (family member or close friend [significant other]) is providing insufficient, ineffective, or compromised support, comfort, assistance, or encouragement that may be needed by the client to manage or master adaptive tasks related to his or her health challenge.

RELATED FACTORS
Inadequate or incorrect information or understanding by a primary person; Temporary preoccupation by a significant person who is trying to manage emotional conflicts and personal suffering and is unable to perceive or to act effectively in regard to client's needs; Temporary family disorganization and role changes; Other situational or developmental crises or situations the significant person may be facing; Little support provided by client, in turn, for the primary person; Prolonged disease or disability progression that exhausts the supportive capacity of significant people; [Unrealistic expectations of patient/significant other(s) or each other]; [Lack of mutual decision-making skills]; [Diverse coalitions of family members]

DEFINING CHARACTERISTICS

Subjective
Client expresses or confirms a concern or complaint about significant other's response to his or her health problem; Significant person describes preoccupation with personal reaction (e.g., fear, anticipatory grief, guilt, anxiety) to client's illness/disability, or other situational or developmental crises; Significant person describes or confirms an inadequate understanding or knowledge base that interferes with effective assistive or supportive behaviors

Objective
Significant person attempts assistive or supportive behaviors with less than satisfactory results; Significant person withdraws or enters into limited or temporary personal communication with client at time of need; Significant person displays protective behavior disproportionate (too little or too much) to client's abilities or need for autonomy; [Significant person displays sudden outbursts of emotions/shows emotional lability or interferes with necessary nursing/medical interventions]

COPING, DEFENSIVE

Diagnostic Division: Ego Integrity

Definition: Repeated projection of falsely positive self-evaluation based on a self-protective pattern that defends against underlying perceived threats to positive self-regard.

RELATED FACTORS
To be developed [Refer to ND Coping, ineffective]

DEFINING CHARACTERISTICS

Subjective
Denial of obvious problems/weaknesses; Projection of blame/responsibility; Rationalizes failures; Hypersensitive to slight/criticism; Grandiosity; [Refuses or rejects assistance]

Objective
Superior attitude toward others; Difficulty establishing/maintaining relationships [avoidance of intimacy]; Hostile laughter or ridicule of others [aggressive behavior]; Difficulty in reality-testing perceptions; Lack of follow-through or participation in treatment or therapy; [Attention-seeking behavior]

COPING, DISABLED FAMILY

Diagnostic Division: Social Interaction

Definition: The behavior of a significant person (family member or other primary person) that disables his or her own capacities and the client's capacity to effectively address tasks essential to either person's adaptation to the health challenge.

RELATED FACTORS

Significant person with chronically unexpressed feelings of guilt, anxiety, hostility, despair, etc.; Dissonant discrepancy of coping styles being used to deal with the adaptive tasks by the significant person and client or among significant people; Highly ambivalent family relationships; Arbitrary handling of a family's resistance to treatment that tends to solidify defensiveness as it fails to deal adequately with underlying anxiety; [High-risk family situations, such as single or adolescent parent, abusive relationship, substance abuse, acute/chronic disabilities, member with terminal illness]

DEFINING CHARACTERISTICS

Subjective

[Expresses despair regarding family reactions/lack of involvement]

Objective

Intolerance; rejection, abandonment; desertion; Psychosomaticism; Agitation, depression, aggression, hostility; Taking on illness signs of client; Neglectful relationships with other family members; Carrying on usual routines disregarding client's needs; Neglectful care of the client in regard to basic human needs and/or illness treatment; Distortion of reality regarding the health problem, including extreme denial about its existence or severity; Decisions and actions by family that are detrimental to economic or social well-being; Impaired restructuring of a meaningful life for self, impaired individualization, prolonged overconcern for client; Client's development of helpless, inactive dependence

COPING, INEFFECTIVE

Diagnostic Division: Ego Integrity

Definition: Inability to form a valid appraisal of the stressors, inadequate choices of practiced responses, and/or inability to use available resources.

RELATED FACTORS

Situational/maturational crises; High degree of threat; Inadequate opportunity to prepare for stressor; disturbance in pattern of appraisal of threat; Inadequate level of confidence in ability to cope/perception of control; uncertainty; Inadequate resources available; inadequate social support created by characteristics of relationships; Disturbance in pattern of tension release; inability to conserve adaptive energies; Gender differences in coping strategies; [Work overload, no vacations, too many deadlines; little or no exercise]; [Impairment of nervous system; cognitive/sensory/perceptual impairment, memory loss]; [Severe/chronic pain]

DEFINING CHARACTERISTICS

Subjective

Verbalization of inability to cope or inability to ask for help; Sleep disturbance; fatigue; Abuse of chemical agents; [Reports of muscular/emotional tension, lack of appetite]

Lack of goal-directed behavior/resolution of problem including: inability to attend, difficulty with organizing information, [lack of assertive behavior]; Use of forms of coping that impede adaptive behavior [including inappropriate use of defense mechanisms, verbal manipulation]; Inadequate problem solving; Inability to meet role expectations/basic needs; Decreased use of social supports; Poor concentration; Change in usual communication patterns; High illness rate [including high blood pressure, ulcers, irritable bowel, frequent headaches/neckaches]; Risk taking; Destructive behavior toward self or others [including overeating, excessive smoking/drinking, overuse of prescribed/over the counter medications; illicit drug use]; [Behavioral changes (e.g., impatience, frustration, irritability, discouragement)]

COPING, INEFFECTIVE COMMUNITY

Diagnostic Division: Social Interaction

Definition: A pattern of community activities for adaption and problem solving that is unsatisfactory for meeting the demands or needs of the community. [Community is defined as "a group of people with a common identity or perspective, occupying space during a given period of time, and functioning through a social system to meet its needs within a larger social environment."]

RELATED FACTORS
Deficits in social support services and resources; Inadequate resources for problem solving; Ineffective or non-existent community systems (e.g., lack of emergency medical system, transportation system, or disaster planning systems); Natural or man-made disasters

DEFINING CHARACTERISTICS

Subjective
Community does not meet its own expectations; Expressed vulnerability; community powerlessness; Stressors perceived as excessive

Objective
Deficits of community participation; Excessive community conflicts; High illness rates; Increased social problems (e.g., homicides, vandalism, arson, terrorism, robbery, infanticide, abuse, divorce, unemployment, poverty, militancy, mental illness)

COPING, READINESS FOR ENHANCED

Diagnostic Division: Ego Integrity

Definition: A pattern of cognitive and behavioral efforts to manage demands that is sufficient for well-being and can be strengthened.

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Defines stressors as manageable; Seeks social support; Acknowledges power; Seeks knowledge of new strategies; Is aware of possible environmental changes

Objective
Uses a broad range of problem-oriented and emotion-oriented strategies; Uses spiritual resources

COPING, READINESS FOR ENHANCED COMMUNITY

Diagnostic Division: Social Interaction

Definition: A pattern of community activities for adaptation and problem solving that is satisfactory for meeting the demands or needs of the community but can be improved for management of current and future problems/stressors.

RELATED FACTORS
Social supports available; Resources available for problem solving; Community has a sense of power to manage stressors

DEFINING CHARACTERISTICS

Subjective
Agreement that community is responsible for stress management

Objective
Deficits in one or more characteristics that indicate effective coping; Active planning by community for predicted stressors; Active problem solving by community when faced with issues; Positive communication among community members; Positive communication between community/aggregates and larger community; Programs available for recreation and relaxation; Resources sufficient for managing stressors

COPING, READINESS FOR ENHANCED FAMILY

Diagnostic Division: Social Interaction

Definition: Effective management of adaptive tasks by family member involved with the health challenge who now is exhibiting desire and readiness for enhanced health and growth in regard to self and in relation to the client.

RELATED FACTORS
Needs sufficiently gratified and adaptive tasks effectively addressed to enable goals of self-actualization to surface; [Developmental stage, situational crises/supports]

DEFINING CHARACTERISTICS

Subjective
Family member attempting to describe growth impact of crisis on his/her own values, priorities, goals, or relationships; Individual expresses interest in making contact on a one-to-one basis or on a mutual-aid group basis with another person who has experienced a similar situation

Objective
Family member is moving in direction of health-promoting and enriching lifestyle that supports and monitors maturational processes, audits and negotiates treatment programs, and generally chooses experiences that optimize wellness

DEATH SYNDROME, SUDDEN INFANT, RISK FOR

Diagnostic Division: Safety

Definition: Presence of risk factors for sudden death of an infant under one year of age

RISK FACTORS
Modifiable
Infants placed to sleep in the prone or side-lying position; Prenatal and/or postnatal infant smoke exposure; Infant overheating/overwrapping; Soft underlayment/loose articles in the sleep environment; Delayed or nonattendance of prenatal care

Potentially Modifiable
Low birth weight; Prematurity; Young maternal age

Nonmodifiable
Male gender; Ethnicity (e.g., African-American or Native American race of mother); Seasonality of SIDS deaths (higher in winter and fall months); SIDS mortality peaks between infant age of 2-4 months

RELATED FACTORS
To be developed

DENIAL, INEFFECTIVE

Diagnostic Division: Ego Integrity

Definition: Conscious or unconscious attempt to disavow the knowledge or meaning of an event to reduce anxiety/fear to the detriment of health.

RELATED FACTORS
To be developed by NANDA: [Personal vulnerability; unmet self-needs]; [Presence of overwhelming anxiety-producing feelings/situation; reality factors that are consciously intolerable]; [Fear of consequences, negative past experiences]; [Learned response patterns (e.g., avoidance)]; [Cultural factors, personal/family value systems]

DEFINING CHARACTERISTICS

Subjective
Minimizes symptoms; displaces source of symptoms to other organs; Unable to admit impact of disease on life pattern; Displaces fear of impact of the condition; Does not admit fear of death or invalidism

Objective
Delays seeking or refuses health care attention to the detriment of health; Does not perceive personal relevance of symptoms or danger; Makes dismissive gestures or

comments when speaking of distressing events; Displays inappropriate affect; Uses home remedies (self-treatment) to relieve symptoms

DENTITION, IMPAIRED

Diagnostic Division: Food / Fluid

Definition: Disruption in tooth development/eruption patterns or structural integrity of individual teeth.

RELATED FACTORS

Dietary habits; nutritional deficits; Selected prescription medications; chronic use of tobacco, coffee or tea, red wine; Ineffective oral hygiene, sensitivity to heat or cold; chronic vomiting; Lack of knowledge regarding dental health; excessive use of abrasive cleaning agents/intake of fluorides; Barriers to self-care; access or economic barriers to professional care; Genetic predisposition; premature loss of primary teeth; bruxism; [Traumatic injury/surgical intervention]

DEFINING CHARACTERISTICS

Subjective

Toothache

Objective

Halitosis; Tooth enamel discoloration; erosion of enamel; excessive plaque; Worn down or abraded teeth; crown or root caries; tooth fracture(s); loose teeth; missing teeth or complete absence; Premature loss of primary teeth; incomplete eruption for age (may be primary or permanent teeth); Excessive calculus; Malocclusion or tooth misalignment; asymmetrical facial expression

DEVELOPMENT, RISK FOR DELAYED

Diagnostic Division: Teaching / Learning

Definition: At risk for delay of 25% or more in one or more of the areas of social or self-regulatory behavior, or cognitive, language, gross or fine motor skills.

RISK FACTORS

Prenatal

Maternal age <15 or >35 years; Unplanned or unwanted pregnancy; lack of, late, or poor prenatal care; Inadequate nutrition; illiteracy; poverty; Genetic or endocrine disorders; substance abuse; infections

Individual

Prematurity; congenital or genetic disorders; Vision/hearing impairment or frequent otitis media; Failure to thrive, inadequate nutrition; chronic illness; Brain damage (e.g., hemorrhage in postnatal period, shaken baby, abuse, accident); seizures; Positive drug screening test; substance abuse; Lead poisoning; chemotherapy; radiation therapy; Foster or adopted child; Behavior disorders; Technology-dependent; Natural disaster

Environmental

Poverty; Violence

Caregiver

Abuse; Mental illness; Mental retardation or severe learning disability

DIARRHEA

Diagnostic Division: Elimination

Definition: Passage of loose, unformed stools.

RELATED FACTORS

Psychological

High stress levels and anxiety

Situational

Laxative/alcohol abuse; toxins; contaminants; Adverse effects of medications; radiation; Tube feedings; Travel

Physiological

Inflammation; irritation; Malabsorption; Infectious processes; parasites

DEFINING CHARACTERISTICS

Subjective
Abdominal pain; Urgency; cramping

Objective
Hyperactive bowel sounds; At least 3 loose or liquid stools per day

DISUSE SYNDROME, RISK FOR

Diagnostic Division: Activity / Rest

Definition: At risk for deterioration of body systems as the result of prescribed or unavoidable musculoskeletal inactivity.

NOTE: NANDA identifies complications from immobility can include pressure ulcer, constipation, stasis of pulmonary secretions, thrombosis, urinary tract infection/retention, decreased strength/endurance, orthostatic hypotension, decreased range of joint motion, disorientation, body image disturbance, and powerlessness.

RISK FACTORS
Severe pain, [chronic pain]; Paralysis [other neuromuscular impairment]; Mechanical or prescribed immobilization; Altered level of consciousness [chronic physical or mental illness]

DIVERSIONAL ACTIVITY, DEFICIENT

Diagnostic Division: Activity / Rest

Definition: Decreased stimulation from (or interest or engagement in) recreational or leisure activities.

NOTE: Internal/external factors that may or may not be beyond the individual's control.

RELATED FACTORS
Environmental lack of diversional activity as in long-term hospitalization; frequent, lengthy treatments, [home-bound]; [Physical limitations, bedridden, fatigue, pain]; [Situational, developmental problem, lack of sources]; [Psychologic condition, such as depression]

DEFINING CHARACTERISTICS

Subjective
Patient's statement regarding the following: Boredom; wish there were something to do, to read, etc.; Usual hobbies cannot be undertaken in hospital [home or other care setting]; [Changes in abilities/physical limitations]

Objective
[Flat affect, disinterested, inattentiveness]; [Restlessness; crying]; [Lethargy; withdrawal]; [Hostility]; [Overeating or lack of interest in eating; weight loss or gain]

ENERGY FIELD DISTURBANCE

Diagnostic Division: Ego Integrity

Definition: A disruption of the flow of energy [aura] surrounding a person's being that results in a disharmony of the body, mind, and/or spirit.

RELATED FACTORS
To be developed: [Block in energy field]; [Depression]; [Increased state of anxiety]; [Impaired immune system]; [Pain]

DEFINING CHARACTERISTICS
Objective
Temperature change (warmth/coolness); Visual changes (image/color); Disruption of the field (vacant/hole/spike/bulge); Movement (wave/spike/tingling/dense/flowing); Sounds (tone/words)

ENVIRONMENTAL INTERPRETATION SYNDROME, IMPAIRED

Diagnostic Division: Safety

Definition: Consistent lack of orientation to person, place, time, or circumstances over more than 3 to 6 months, necessitating a protective environment.

RELATED FACTORS
Dementia (Alzheimer's disease, multi-infarct dementia, Pick's disease, AIDS dementia); Parkinson's disease; Huntington's disease; Depression; Alcoholism

DEFINING CHARACTERISTICS

Subjective
[Loss of occupation or social function from memory decline]

Objective
Consistent disorientation in known and unknown environments; Chronic confusional states; Inability to follow simple directions, instructions; Inability to reason, to concentrate; slow in responding to questions; Loss of occupation or social function from memory decline

FAILURE TO THRIVE, ADULT

Diagnostic Division: Food/Fluid

Definition: A progressive functional deterioration of a physical and cognitive nature; the individual's ability to live with multisystem diseases, cope with ensuing problems, and manage his/her care is remarkably diminished.

RELATED FACTORS
Depression; apathy; Fatigue [Major disease/degenerative condition]; [Aging process]

DEFINING CHARACTERISTICS

Subjective
States does not have an appetite, not hungry, or "I don't want to eat"; Expresses loss of interest in pleasurable outlets, such as food, sex, work, friends, family, hobbies, or entertainment; Difficulty performing simple self-care tasks; Altered mood state—expresses feelings of sadness, being low in spirit; Verbalizes desire for death

Objective
Inadequate nutritional intake–eating less than body requirements; consumes minimal to none of food at most meals (i.e., consumes less than 75% of normal requirements at each or most meals); anorexia–does not eat meals when offered; Weight loss (decreased body mass from base line weight)–5% unintentional weight loss in 1 month, 10% unintentional weight loss in 6 months; Physical decline (decline in bodily function)–evidence of fatigue, dehydration, incontinence of bowel and bladder; Cognitive decline (decline in mental processing)–as evidenced by problems with responding appropriately to environmental stimuli, demonstrates difficulty in reasoning, decision making, judgment, memory and concentration, decreased perception; Apathy as evidenced by lack of observable feeling or emotion in terms of normal activities of daily living and environment; Decreased participation in activities of daily living that the older person once enjoyed; self-care deficit–no longer looks after or takes charge of physical cleanliness or appearance; neglects home environment and/or financial responsibilities; Decreased social skills/social withdrawal–noticeable decrease from usual past behavior in attempts to form or participate in cooperative and interdependent relationships (e.g., decreased verbal communication with staff, family, friends); Frequent exacerbations of chronic health problems such as pneumonia or urinary tract infections

FALLS, RISK FOR

Diagnostic Division: Safety

Definition: Increased susceptibility to falling that may cause physical harm.

RISK FACTORS
Adults:
History of falls; wheelchair use; use of assistive devices (e.g., walker, cane); Age 65 or over; Female (if elderly); Lives alone; Lower limb prosthesis

Physiological:
Presence of acute illness; postoperative conditions; Visual/hearing difficulties; Impaired physical mobility; Foot problems; Decreased lower extremity strength; Arthritis; Impaired balance; Difficulty with gait; Proprioceptive deficits (e.g., unilateral neglect); Neuropathies; [Cardio and neuro] vascular disease; Anemias; Endoplasms (i.e., fatigue/limited mobility); Orthostatic hypotension; [dehydration/blood loss]; Faintness when turning or extending neck; Sleeplessness/ [sleep disturbances]; Urgency and/or incontinence; Diarrhea; Postprandial blood sugar changes/[hypoglycemia]

Cognitive:
Diminished mental status (e.g., confusion, [agitation]/delirium, dementia, impaired reality testing); Medications; Antihypertensive agents; ACE inhibitors; Diuretics; Tricyclic antidepressants; Antianxiety agents; Hypnotics or tranquilizers [polypharmacy (multiple medications); Alcohol use; Narcotics

Environment:
Restraints; Weather conditions (e.g., wet floors/ice); Cluttered environment; Throw/scatter rugs; No antislip material in bath and/or shower; Unfamiliar, dimly lit room

Children
2 years of age; male gender when <1 year of age; Lack of gate on stairs; Window guards; Auto restraints; Unattended infant on bed/changing table/sofa bed located near window; Lack of parental supervision

FAMILY PROCESSES, DYSFUNCTIONAL: ALCOHOLISM

Diagnostic Division: Social Interaction

Definition: Psychosocial, spiritual, and physiologic functions of the family unit are chronically disorganized, leading to conflict, denial of problems, resistance to change, ineffective problem-solving, and a series of self-perpetuating crises.

RELATED FACTORS
Abuse of alcohol; resistance to treatment; Family history of alcoholism; Inadequate coping skills; addictive personality; lack of problem-solving skills; Biochemical influences; genetic predisposition

DEFINING CHARACTERISTICS

Subjective
Feelings
Anxiety/tension/distress; decreased self-esteem/worthlessness; lingering resentment; Anger/suppressed rage; frustration; shame/embarrassment; hurt; unhappiness; guilt; Emotional isolation/Loneliness; powerlessness; insecurity; hopelessness; rejection; Responsibility for alcoholic's behavior; vulnerability; mistrust; Depression; hostility; fear; confusion; dissatisfaction; loss; repressed emotions; Being different from other people; misunderstood; Emotional control by others; being unloved; lack of identity; Abandonment; confused love and pity; moodiness; failure

Roles and Relationships
Family denial; deterioration in family relationships/disturbed family dynamics; ineffective spouse communication/marital problems; intimacy dysfunction; Altered role function/disruption of family roles; inconsistent parenting/low perception of parental support; chronic family problems; Lack of skills necessary for relationships; lack of cohesiveness; disrupted family rituals; Family unable to meet security needs of its members; Pattern of rejection; economic problems; neglected obligations

Objective
Roles and Relationships
Closed communication systems; Triangulating family relationships; reduced ability of family members to relate to each other for mutual growth and maturation; Family does not demonstrate respect for individuality and autonomy of its members

Behaviors
Expression of anger inappropriately; difficulty with intimate relationships; impaired communication; ineffective problem-solving skills; inability to meet emotional needs of its members; manipulation; dependency; criticizing; broken promises; rationalization/denial of problems; Refusal to get help/inability to accept and receive help appropriately; blaming; Loss of control of drinking; enabling to maintain drinking [substance abuse]; alcohol [substance] abuse; inadequate understanding or knowledge of alcoholism [substance abuse]; Inability to meet spiritual needs of its members; In-

ability to express or accept wide range of feelings; orientation toward tension relief rather than achievement of goals; escalating conflict; Lying; contradictory, paradoxical communication; lack of dealing with conflict; harsh self-judgment; isolation; difficulty having fun; self-blaming; unresolved grief; Controlling communication/power struggles; seeking approval and affirmation; Lack of reliability; disturbances in academic performance in children; disturbances in concentration; chaos; failure to accomplish current or past developmental tasks/difficulty with life cycle transitions; Verbal abuse of spouse or parent; agitation; diminished physical contact; Family special occasions are alcohol-centered; nicotine addiction; inability to adapt to change; immaturity; stress-related physical illnesses; inability to deal with traumatic experiences constructively; substance abuse other than alcohol

FAMILY PROCESSES, INTERRUPTED

Diagnostic Division: Social Interaction

Definition: A change in family relationships and/or functioning.

RELATED FACTORS

Situational transition and/or crises [e.g., economic, change in roles, illness, trauma, disabling/expensive treatments]; Developmental transition and/or crisis [e.g., loss or gain of a family member, adolescence, leaving home for college]; Shift in health status of a family member; Family roles shift; power shift of family members; Modification in family finances, social status; Informal or formal interaction with community

DEFINING CHARACTERISTICS

Subjective

Changes in: power alliances; satisfaction with family; expressions of conflict with family; effectiveness in completing assigned tasks; stress-reduction behaviors; expressions of conflict with and/or isolation from community resources; somatic complaints; [Family expresses confusion about what to do; verbalizes they are having difficulty responding to change]

Objective

Changes in: assigned tasks; participation in problem solving/decision making; communication patterns; mutual support; availability for emotional support/affective responsiveness and intimacy; patterns and rituals

FAMILY PROCESSES, READINESS FOR ENHANCED

Diagnostic Division: Social Interaction

Definition: A pattern of family functioning that is sufficient to support the well-being of family members and can be strengthened

RELATED FACTORS

To be developed

DEFINING CHARACTERISTICS

Subjective

Expresses willingness to enhance family dynamics

Objective

Family functioning meets physical, social, and psychological needs of family members; Activities support the safety and growth of family members; Communication is adequate; Relationships are generally positive: interdependent with community; Family tasks are accomplished; Family roles are flexible and appropriate for developmental stages; Respect for family members is evident; Family adapts to change; Boundaries of family members are maintained; Energy level of family supports activities of daily living; Family resilience is evident; Balance exists between autonomy and cohesiveness

FATIGUE

Diagnostic Division: Activity / Rest

Definition: An overwhelming sustained sense of exhaustion and decreased capacity for physical and mental work at usual level.

RELATED FACTORS
Psychological
Stress; anxiety; boring lifestyle; depression

Environmental
Noise; lights; humidity; temperature

Situational
Occupation; negative life events

Physiological
Increased physical exertion; sleep deprivation; Pregnancy; disease states; malnutrition; anemia; Poor physical condition; [Altered body chemistry (e.g., medications, drug withdrawal, chemotherapy)]

DEFINING CHARACTERISTICS

Subjective
Verbalization of an unremitting and overwhelming lack of energy; inability to maintain usual routines/level of physical activity; Perceived need for additional energy to accomplish routine tasks; increase in rest requirements; Tired; inability to restore energy even after sleep; Feelings of guilt for not keeping up with responsibilities; Compromised libido; Increase in physical complaints

Objective
Lethargic or listless; drowsy; Compromised concentration; Disinterest in surroundings/introspection; Decreased performance, [accident-prone]

FEAR

Diagnostic Division: Ego Integrity

Definition: Fear is anxiety caused by consciously recognized and realistic danger. It is a perceived threat, real or imagined. Operationally, fear is the presence of immediate feeling of apprehension and fright; source known and specific; subjective responses that act as energizers but cannot be observed; and objective signs that are the result of the transformation of energy into relief behaviors and responses.

RELATED FACTORS
Natural/innate origins; innate releasers; Knowledge deficit; discrepancy; language barrier; Environmental stimuli; sensory impairment; Physical/social conditions; separation from support system in potentially stressful situation [e.g., hospitalization, treatments]; Phobic stimulus or phobia; fear for others; ideas; learned response; classical conditioning

DEFINING CHARACTERISTICS

Subjective
Ability to identify object of fear; focus on "it" out there; Apprehension; frightened; worry; alarm; Increased tension; Panicky; terrified; dread; afraid; horror; [Associated physical symptoms, nausea, "heart beating fast," and so on]

Objective
Immediate response to object of fear; Attack/fight behavior–aggressive; Flight behavior–withdrawal; Wide-eyed, increased alertness, concentration on the source; Increased tension; wariness; jittery; Decreased self-assurance; impulsiveness; Increased heart rate; Bed wetting

FLUID BALANCE, READINESS FOR ENHANCED

Diagnostic Division: Food/Fluid

Definition: A pattern of equilibrium between fluid volume and chemical composition of body fluids that is sufficient for meeting physical needs and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance fluid balance

Objective
Stable weight; Moist mucous membranes; Food and fluid intake adequate for daily needs; Straw-colored urine with specific gravity within normal limits; Good tissue turgor; No excessive thirst; Urine output appropriate for intake; No evidence of edema or dehydration

[FLUID VOLUME, DEFICIENT HYPER/HYPOTONIC]

Diagnostic Division: Food / Fluid

Definition: Decreased intravascular, interstitial, and/or intracellular fluid. This refers to dehydration with changes in sodium.

RELATED FACTORS
Hypertonic dehydration: uncontrolled diabetes mellitus/insipidus, HHNC increased risk of hypertonic fluids/IV therapy, inability to respond to thirst reflex/inadequate free water supplementation (high-osmolarity enteral feeding formulas), renal insufficiency failure]; [Hypotonic dehydration: chronic illness/malnutrition, excessive use of hypotonic IV solutions (e.g., D_5W), renal insufficiency]

DEFINING CHARACTERISTICS

Subjective
[Reports of fatigue, nervousness, Exhaustion]; [Thirst]

Objective
[Increased urine output, dilute urine (initially) and/or decreased output/oliguria]; [Weight loss]; [Decreased venous filling]; [Hypotension (postural)]; [Increased pulse rate; decreased pulse volume and pressure]; [Decreased skin turgor]; [Change in mental status (e.g., confusion)]; [Increased body temperature]; [Dry skin/ mucous membranes]; [Hemoconcentration; altered serum sodium]

FLUID VOLUME, DEFICIENT [ISOTONIC]

Diagnostic Division: Food / Fluid

Definition: Decreased intravascular, interstitial and/or intracellular fluid. This refers to dehydration, water loss alone without change in sodium.

NOTE: This diagnosis has been structured to address isotonic dehydration (hypovolemia) excluding states in which changes in sodium occur. For patient needs related to dehydration associated with alterations in sodium, refer to [Fluid volume, deficient hyper/hypotonic].

RELATED FACTORS
Active fluid volume loss [e.g., hemorrhage, gastric intubation, diarrhea, wounds; abdominal cancer; burns; fistulas; ascites (third spacing); use of hyperosmotic radiopaque contrast agents]; Failure of regulatory mechanisms [e.g., fever/thermoregulatory response; renal tubule damage]

DEFINING CHARACTERISTICS

Subjective
Thirst; Weakness

Objective
Decreased urine output; Increased urine concentration; Decreased venous filling; Decreased pulse volume and pressure; Sudden weight loss (except in third spacing); Elevated Hct; Decreased blood pressure; increased pulse rate/body temperature; Decreased skin/tongue turgor, dry skin/mucous membranes; Change in mental state; [Weight gain/edema (third spacing)]

FLUID VOLUME , RISK FOR DEFICIENT

Diagnostic Division: Foood / Fluid

Definition: At risk for experiencing vascular, cellular, or intracellular dehydration.

RISK FACTORS
Extremes of age and weight; Loss of fluid through abnormal routes (e.g., indwelling tubes); Knowledge deficiency related to fluid volume; Factors influencing fluid needs

(e.g., hypermetabolic states); Medications (e.g., diuretics); Excessive losses through normal routes (e.g., diarrhea); Deviations affecting access to, intake of, or absorption of fluids (e.g., physical immobility)

FLUID VOLUME EXCESS

Diagnostic Division: Food / Fluid

Definition: Increased isotonic fluid retention.

RELATED FACTORS

Compromised regulatory mechanism [e.g., SIADH or decreased plasma proteins as found in conditions such as malnutrition, draining fistulas, burns, organ failure]; Excess fluid intake; Excess sodium intake; [Drug therapies, such as chlorpropamide, tolbutamide, vincristine, triptylines, carbamazepine]

DEFINING CHARACTERISTICS

Subjective

Shortness of breath, orthopnea; Anxiety

Objective

Edema, pleural effusion, anasarca; weight gain over short period; Intake exceeds output; oliguria; Abnormal breath sounds (rales or crackles); dyspnea; Decreased hemoglobin, hematocrit; Increased central venous pressure; jugular vein distention; positive hepatojugular reflex; S_3 heart sound; Pulmonary congestion; pulmonary artery pressure changes; change is respiratory pattern; Blood pressure changes; Change in mental status; restlessness; Specific gravity changes; Azotemia, altered electrolytes

FLUID VOLUME IMBALANCE, RISK FOR

Diagnostic Division: Food / Fluid

Definition: A risk of a decrease, an increase, or a rapid shift from one to the other of intravascular, interstitial, and/or intracellular fluid. This refers to the loss or excess or to the other of intravascular, interstitial, and/or intracellular fluid. This refers to the loss, gain or both of body fluids or replacement fluids.

RISK FACTORS

Scheduled for major invasive procedures [Rapid/sustained loss (e.g., hemorrhage, burns, fistulas)]; [Rapid fluid replacement]; Other risk factors to be determined

GAS EXCHANGE, IMPAIRED

Diagnostic Division: Respiration

Definition: Excess or deficit in oxygenation and/or carbon dioxide elimination at the alveolar-capillary membrane. [This may be an entity of its own but also may be an end result of other pathology with an interrelatedness between airway clearance and/or breathing pattern problems.]

RELATED FACTORS

Ventilation perfusion imbalance [as in the following: altered blood flow (e.g., pulmonary embolus, increased vascular resistance), vasospasm, heart failure, hypovolemic shock]; Alveolar-capillary membrane changes (e.g., acute adult respiratory distress syndrome); chronic conditions such as restrictive/obstructive lung disease, pneumoconiosis, respiratory depressant drugs, brain injury, asbestosis/silicosis; [Altered oxygen supply (e.g., altitude sickness)]; [Altered oxygen-carrying capacity of blood (e.g., sickle cell/other anemia, carbon monoxide poisoning)]

DEFINING CHARACTERISTICS

Subjective

Dyspnea; Visual disturbances; Headache upon awakening; [sense of impending doom]

Objective

Confusion; [decreased mental acuity]; Restlessness, irritability, [agitation]; Somnolence, [lethargy]; Abnormal arterial blood gases/pH; hypoxia/hypoxemia; hypercapnia/hypercarbia; decreased carbon dioxide; Cyanosis (in neonates only); abnormal skin color (pale, dusky); Abnormal rate, rhythm, depth of breathing; nasal flaring; Tachycardia [development of dysrhythmias]; Diaphoresis; [polycythemia]

GRIEVING, ANTICIPATORY

Diagnostic Division: Ego Integrity

Definition: Intellectual and emotional responses and behaviors by which individuals, families, communities work through the process of modifying self-concept based on the perception of potential loss.

NOTE: May be a healthy response requiring interventions of support and information-giving.

RELATED FACTORS

To be developed; [Perceived potential loss of significant other, physiological/psychosocial well-being (body part/function, social role), lifestyle/personal possessions]

DEFINING CHARACTERISTICS

Subjective

Sorrow; guilt; anger, [choked feelings]; Denial of potential loss; denial of the significance of the loss; Expression of distress at potential loss, [ambivalence, sense of unreality]; bargaining; Alterations in activity level, eating habits, sleep patterns, dream patterns, libido

Objective

Potential loss of significant object [personal/self, job/position, developmental stage/abilities, health, body part/function]; Altered communication patterns; Difficulty taking on new or different roles; Resolution of grief prior to the reality of loss [Altered affect]; [Crying]; [Social isolation, withdrawal]

GRIEVING, DYSFUNCTIONAL

Diagnostic Division: Ego Integrity

Definition: Extended, unsuccessful use of intellectual and emotional responses by which individuals, families, communities attempt to work through the process of modifying self-concept based on the perception of potential loss.

NOTE: Although NANDA now defines this diagnosis in terms of a potential loss (which is addressed in anticipatory grieving), the authors also view dysfunctional grieving as a response to a loss that has already occurred.

RELATED FACTORS

Actual or perceived object loss (object loss is used in the broadest sense)—objects may include people, possessions, a job, status, home, ideals, parts and processes of the body [e.g., amputation, paralysis, chronic/terminal illness]; [Thwarted grieving response to a loss]; [Lack of resolution of previous grieving response]; [Absence of anticipatory grieving]

DEFINING CHARACTERISTICS

Subjective

Expression of distress at loss; denial of loss; Expression of guilt, anger, sadness, unresolved issues; [hopelessness]; Idealization of lost object; Reliving of past experiences with little or no reduction (diminishment) of intensity of the grief; Alterations in eating habits, sleep and dream patterns, activity level, libido, concentration and/or pursuits of tasks

Objective

Onset or exacerbation of somatic or psychosomatic responses; Crying; labile affect; Difficulty in expressing loss; Prolonged interference with life functioning; developmental regression; Repetitive use of ineffectual behaviors associated with attempts to reinvest in relationships; [Withdrawal, isolation]

GROWTH AND DEVELOPMENT, DELAYED

Diagnostic Division: Teaching/Learning

Definition: Deviations from age growth norms.

RELATED FACTORS

Inadequate caretaking, [physical/emotional neglect/abuse]; Indifference, inconsistent responsiveness, multiple caretakers; Separation from significant others; Environmen-

tal and stimulation deficiencies; Effects of physical disability [handicapping condition]; Prescribed dependence [insufficient expectations for self-care]; [Physical/ emotional illness, chronic, traumatic (e.g., chronic inflammatory disease, pituitary tumors, impaired nutrition/metabolism, greater-than-normal energy requirements; prolonged/painful treatments; prolonged/repeated hospitilizations]; [Sexual abuse]; [Substance use/abuse including anabolic steroids]

DEFINING CHARACTERISTICS

Subjective
Inability to perform self-care or self-control activities appropriate for age

Objective
Delay or difficulty in performing skills (motor, social, or expressive) typical of age group; [Loss of previously acquired skills; precocious or accelerated skill attainment; Altered physical growth; Flat affect, listlessness, decreased responses; [Sleep disturbances, negative mood/response]

GROWTH, RISK FOR DISPROPORTIONATE

Diagnostic Division: Teaching / Learning

Definition: At risk for growth above the 97th percentile or below the 3rd percentile for age, crossing two percentile channels; disproportionate growth.

RISK FACTORS
Prenatal
Congenital/genetic disorders [e.g., dysfunction of endocrine gland, tumors]; Maternal nutrition; multiple gestation; Substance use/abuse; teratogen exposure

Individual
Organic and inorganic factors; Prematurity; Malnutrition; caregiver and/or individual maladaptive feeding behaviors; insatiable appetite; anorexia; [impaired metabolism, greater-than-normal energy requirements]; Infection; chronic illness [e.g., chronic inflammatory diseases]; Substance [use]/abuse [including anabolic steroids]

Environmental
Deprivation; poverty; Violence; natural disasters; Teratogen; lead poisoning

Caregiver
Abuse; Mental illness/retardation, severe learning disability

HEALTH MAINTENANCE, INEFFECTIVE

Diagnostic Division: Safety

Definition: Inability to identify, manage, and/or seek out help to maintain health. [This diagnosis contains components of other nursing diagnoses. We recommend subsuming health maintenance interventions under the "basic" nursing diagnosis when a single causative factor is identified (e.g., Knowledge, deficient; Communication, impaired verbal; Thought Processes, disturbed; Individual/Family Coping, ineffective; Growth and Development, delayed).]

RELATED FACTORS
Lack of or significant alteration in communication skills (written, verbal, and/or gestural); Unachieved developmental tasks; Lack of ability to make deliberate and thoughtful judgments; Perceptual or cognitive impairment (complete or partial lack of gross and/or fine motor skills); Ineffective individual coping; dysfunctional grieving; disabling spiritual distress; Lack of material resource; Ineffective family coping; [Lack of psychosocial supports]

DEFINING CHARACTERISTICS

Subjective
Expressed interest in improving health behaviors; Reported lack of equipment, financial and/or other resources; impairment of personal support systems; Reported inability to take the responsibility for meeting basic health practices in any or all functional pattern areas; [Reported compulsive behaviors]

Objective
Demonstrated lack of knowledge regarding basic health practices; Observed inability to take the responsibility for meeting basic health practices in any or all functional pat-

tern areas; history of lack of health-seeking behavior; Demonstrated lack of adaptive behaviors to internal or external environmental changes; Observed impairment of personal support system; lack of equipment, financial and/or other resources; [Observed compulsive behaviors]

HEALTH-SEEKING BEHAVIORS (SPECIFY)

Diagnostic Division: Teaching / Learning

Definition: Active seeking (by a person in stable health) of ways to alter personal health habits and/or the environment in order to move toward higher level of health.

RELATED FACTORS
[Situational/maturational occurrence precipitating concern about current health status]

DEFINING CHARACTERISTICS

Subjective
Expressed desire to seek a higher level of wellness; Expressed desire for increased control of health practice; Expression of concern about current environmental conditions on health status; Stated unfamiliarity with wellness community resources; [Expressed desire to modify codependent behaviors]

Objective
Observed desire to seek a higher level of wellness; Observed desire for increased control of health practice; Demonstrated or observed lack of knowledge in health promotion behaviors, unfamiliarity with wellness community resources

HOME MAINTENANCE, IMPAIRED

Diagnostic Division: Safety

Definition: Inability to independently maintain a safe, growth-promoting immediate environment.

RELATED FACTORS
Individual/family member disease or injury; Insufficient family organization or planning; Insufficient finances; Impaired cognitive or emotional functioning; Lack of role modeling; Unfamiliarity with neighborhood resources; Lack of knowledge; Inadequate support systems

DEFINING CHARACTERISTICS

Subjective
Household members express difficulty in maintaining their home in a comfortable [safe] fashion; Household requests assistance with home maintenance; Household members describe outstanding debts or financial crises

Objective
Accumulation of dirt, food or hygienic wastes; Unwashed or unavailable cooking equipment, clothes, or linen; Overtaxed family members (e.g., exhausted, anxious); Repeated hygienic disorders, infestations, or infections; Disorderly surroundings; offensive odors; Inappropriate household temperature; Lack of necessary equipment or aids; Presence of vermin or rodents

HOPELESSNESS

Diagnostic Division: Ego Integrity

Definition: A subjective state in which an individual sees limited or no alternatives or personal choices available and is unable to mobilize energy on own behalf.

RELATED FACTORS
Prolonged activity restriction, creating isolation; Failing or deteriorating physiologic condition; Long-term stress; abandonment; Lost belief in transcendent values/God

DEFINING CHARACTERISTICS

Subjective
Verbal cues (despondent content, "I can't," sighing); [believes things will not change/problems will always be there]

Objective
Passivity, decreased verbalization; Decreased affect; Lack of initiative; Decreased response to stimuli [depressed cognitive functions, problems with decisions, thought processes; regression]; Turning away from speaker; closing eyes; shrugging in response to speaker; Decreased appetite, increased/decreased sleep; Lack of involvement in care/passively allowing care; [Withdrawal from environs]; [Lack of involvement/interest in significant other(s) (children, spouse)]; [Angry outbursts]

HYPERTHERMIA

Diagnostic Division: Safety

Definition: Body temperature is elevated above normal range.

RELATED FACTORS
Exposure to hot environment; inappropriate clothing; Vigorous activity; dehydration; Medications/anesthesia; Increased metabolic rate, illness or trauma; Inability or decreased ability to perspire

DEFINING CHARACTERISTICS

Subjective
[Headache]

Objective
Flushed skin, warm to touch; Increase in body temperature above normal range; Increased respiratory rate, tachycardia; [Unstable blood pressure]; Seizures/convulsions; [Muscle rigidity/fasciculations]; [Confusion]

HYPOTHERMIA

Diagnostic Division: Safety

Definition: Body temperature is below normal range.

RELATED FACTORS
Exposure to cool or cold environment [prolonged exposure (e.g., homeless), immersion in cold water/near drowning, induced hypothermia/cardiopulmonary bypass]; Inadequate clothing; Evaporation from skin in cool environment; Inability or decreased ability to shiver; Aging [or very young]; [Debilitating] illness or trauma, damage to hypothalamus; Malnutrition; Decreased metabolic rate; Inactivity; Consumption of alcohol; Medications[/drug overdose] causing vasodilation

DEFINING CHARACTERISTICS
Objective
Reduction in body temperature below normal range; Shivering; Cool skin; Pallor; Slow capillary refill; Cyanotic nail beds; Hypertension; Tachycardia; Piloerection; [Core temperature 95°F/35°C: increased respirations, poor judgment, shivering]; [Core temperature 95° to 93.2°F/35° to 34°C: bradycardia or tachycardia, myocardial irritability/dysrhythmias, muscle rigidity, shivering, lethargic/confused, decreased coordination]; [Core temperature 93.2° to 86°F/34° to 30°C: hypoventilation, bradycardia, generalized rigidity, metabolic acidosis, coma]; [Core temperature 86°F/30°C: no apparent vital signs, heart rate unresponsive to drug therapy, comatose, cyanotic, dilated pupils, apneic, areflexic, no shivering (appears dead)]

IDENTITY, DISTURBED PERSONAL

Diagnostic Division: Ego Integrity

Definition: Inability to distinguish between self and nonself.

RELATED FACTORS
To be developed: [Organic brain syndrome]; [Poor ego differentiation, as in schizophrenia]; [Panic/dissociative states]; [Biochemical body change]

DEFINING CHARACTERISTICS
(To be developed)

Subjective
[Confusion about sense of self, purpose or direction in life, sexual identification/preference]

Objective
[Difficulty in making decisions]; [Poorly differentiated ego boundaries]; [See ND Anxiety, panic, for additional characteristics]

INCONTINENCE, FUNCTIONAL URINARY

Diagnostic Division: Elimination

Definition: Inability of usually continent person to reach toilet in time to avoid unintentional loss of urine.

RELATED FACTORS
Altered environmental factors [e.g., poor lighting or inability to locate bathroom]; impaired vision/cognition; neuromuscular limitations; weakened supporting pelvic structures; psychological factors; [reluctance to use call light or bedpan]; [increased urine production]

DEFINING CHARACTERISTICS

Subjective
Senses need to void; [voiding in large amounts]

Objective
Loss of urine before reaching toilet; amount of time required to reach toilet exceeds length of time between sensing urge and uncontrolled voiding; able to completely empty bladder; may only be incontinent in early morning

INCONTINENCE, REFLEX URINARY

Diagnostic Division: Elimination

Definition: An involuntary loss of urine at somewhat predictable intervals when a specific bladder volume is reached.

RELATED FACTORS
Tissue damage from radiation cystitis, inflammatory bladder conditions, or radical pelvic surgery; neurological impairment above level of sacral micturition center or pontine micturition center

DEFINING CHARACTERISTICS

Subjective
No sensation of bladder fullness/urge to void/voiding; sensation to urge without voluntary inhibition of bladder contraction; sensations associated with full bladder such as sweating, restlessness, and abdominal discomfort

Objective
Predictable pattern of voiding; unable to cognitively inhibit or initiate voiding; complete emptying with [brain] lesion above pontine micturition center; incomplete emptying with [spinal cord] lesion above sacral micturition center

INCONTINENCE, STRESS URINARY

Diagnostic Division: Elimination

Definition: Loss of less than 50 ml of urine occurring with increased abdominal pressure.

RELATED FACTORS
Degenerative changes in pelvic muscles and structural supports associated with increased age [e.g., poor closure of urethral sphincter, estrogen deficiency]; High intra-abdominal pressure (e.g., obesity, gravid uterus); Incompetent bladder outlet; Overdistention between voidings; Weak pelvic muscles and structural supports [e.g., straining with chronic constipation]; [Neural degeneration, vascular deficits, surgery, radiation therapy]

DEFINING CHARACTERISTICS

Subjective
Reported dribbling with increased abdominal pressure [e.g., coughing, sneezing, lifting, impact aerobics, changing position]; Urinary urgency/frequency (more often than every 2 hours)

Objective
Observed dribbling with increased abdominal pressure

INCONTINENCE, TOTAL URINARY

Diagnostic Division: Elimination

Definition: Continuous and unpredictable loss of urine.

RELATED FACTORS
Neuropathy preventing transmission of reflex [signals to the reflex arc] indicating bladder fullness; Neurologic dysfunction causing triggering of micturition at unpredictable times [e.g., cerebral lesions]; Independent contraction of detrusor reflex due to surgery; Trauma or disease affecting spinal cord nerves [destruction of sensory or motor neurons below the injury level]; Anatomic (fistula)

DEFINING CHARACTERISTICS

Subjective
Constant flow of urine occurs at unpredictable times without distention or uninhibited bladder contractions/spasm; Nocturia; Lack of perineal or bladder filling awareness; Unawareness of incontinence

Objective
Unsuccessful incontinence refractory treatments

INCONTINENCE, URGE URINARY

Diagnostic Division: Elimination

Definition: Involuntary passage of urine occurring soon after a strong sense of urgency to void.

RELATED FACTORS
Decreased bladder capacity (e.g., history of pelvic inflammatory disease, abdominal surgeries, indwelling urinary catheter); Irritation of bladder stretch receptors causing spasm (e.g., bladder infection [atrophic urethritis, vaginitis]); alcohol; caffeine; increased fluids; increased urine concentration; overdistention of bladder; [Medication use, such as diuretics, sedatives, anticholinergic agents]; [Constipation/stool impaction]; [Restricted mobility; psychological disorder such as depression, change in mentation/confusional state (e.g., stroke, dementia, Parkinson's disease)]

DEFINING CHARACTERISTICS

Subjective
Urinary urgency; Frequency (voiding more often than every 2 hours); Bladder contracture/spasm; Nocturia (more than two times per night)

Objective
Inability to reach toilet in time; Voiding in small amounts (less than 100 ml) or in large amounts (more than 550 ml)

INCONTINENCE, RISK FOR URINARY URGE

Diagnostic Division: Elimination

Definition: Risk for involuntary loss of urine associated with a sudden, strong sensation or urinary urgency.

RISK FACTORS
Effects of medications, caffeine, alcohol; Detrusor hyperreflexia from cystitis, urethritis, tumors, renal calculi; Central nervous system disorders above pontine micturition center; detrusor muscle instability with impaired contractility; involuntary sphincter relaxation; Ineffective toileting habits; Small bladder capacity

INFANT BEHAVIOR, DISORGANIZED

Diagnostic Division: Neurosensory

Definition: Disintegrated physiological and neurobehavioral responses to the environment.

RELATED FACTORS
Prenatal
Congenital or genetic disorders; teratogenic exposure; [exposure to drugs]

Postnatal
Prematurity; oral/motor problems; feeding intolerance; malnutrition; Invasive/painful procedures

Individual
Gestational/postconceptual age; immature neurological system; Illness; [infection]; [hypoxia/birth asphyxia].

Environmental
Physical environment inappropriateness; Sensory inappropriateness/overstimulation/deprivation; [Lack of containment/boundaries]

Caregiver
Cue misreading/cue knowledge deficit; Environmental stimulation contribution

DEFINING CHARACTERISTICS
Objective
Regulatory Problems
Inability to inhibit [e.g., locking in—inability to look away from stimulus]; irritability

State-Organization System
Active-awake (fussy, worried gaze); quiet-awake (staring, gaze aversion); Diffuse/unclear sleep, state oscillation; Irritable or panicky crying

Attention-Interaction System
Abnormal response to sensory stimuli (e.g., difficult to soothe, inability to sustain alert status)

Motor System
Increased, decreased, or limp tone; Finger splay, fisting or hands to face; hyperextension of arms and legs; Tremors, startles, twitches; jittery, jerky, uncoordinated movement; Altered primitive reflexes

Physiological
Bradycardia, tachycardia, or arrhythmias; Pale, cyanotic, mottled, or flushed color; Bradypnea, tachypnea, apnea; "Time-out signals" (e.g., gaze, grasp, hiccough, cough, sneeze, sigh, slack jaw, open mouth, tongue thrust); Oximeter desaturation; Feeding intolerances (aspiration or emesis)

INFANT BEHAVIOR, READINESS FOR ENHANCED ORGANIZED

Diagnostic Division: Neurosensory

Definition: A pattern of modulation of the physiologic and behavioral systems of functioning of an infant (i.e., autonomic, motor, state, organizational, self-regulatory, and attentional-interactional systems) that is satisfactory but that can be improved, resulting in higher levels of integration in response to environmental stimuli.

RELATED FACTORS
Prematurity; Pain

DEFINING CHARACTERISTICS
Objective
Stable physiologic measures; Definite sleep-wake states; Use of some self-regulatory behaviors; Response to visual/auditory stimuli

INFANT BEHAVIOR, RISK FOR DISORGANIZED

Diagnostic Division: Neurosensory

Definition: Risk for alteration in integration and modulation of the physiologic and behavioral systems of functioning (i.e., autonomic, motor, state, organizational, self-regulatory, and attentional-interactional systems).

RISK FACTORS
Pain; Oral/motor problems; Environmental overstimulation; Lack of containment/boundaries; Invasive/painful procedures; Prematurity; [immaturity of the central nervous system; generic problems that alter neurologic and/or physiologic functioning conditions resulting in hypoxia and/or birth asphyxia]; [Malnutrition; infection; drug addiction]; [Environmental events or conditions such as separation from parent, exposure to loud noise, excessive handling, bright lights]

INFANT FEEDING PATTERN, INEFFECTIVE

Diagnostic Division: Food/Fluid

Definition: Impaired ability to suck or coordinate the suck-swallow response.

RELATED FACTORS
Prematurity; Neurological impairment/delay; Oral hypersensitivity; Prolonged NPO; Anatomic abnormality

DEFINING CHARACTERISTICS

Subjective
[Caregiver reports infant is unable to initiate or sustain an effective suck]

Objective
Inability to initiate or sustain an effective suck; Inability to coordinate sucking, swallowing, and breathing

INFECTION, RISK FOR

Diagnostic Division: Safety

Definition: At increased risk for being invaded by pathogenic organisms.

RISK FACTORS
Inadequate primary defenses (broken skin, traumatized tissue, decrease of ciliary action, stasis of body fluids, change in pH secretions, altered peristalsis); Inadequate secondary defenses (e.g., decreased hemoglobin, leukopenia, suppressed inflammatory response) and immunosuppression; Inadequate acquired immunity; tissue destruction and increased environmental exposure; invasive procedures; Chronic disease, malnutrition, trauma; Pharmaceutical agents [including antibiotic therapy]; Rupture of amniotic membranes; Insufficient knowledge to avoid exposure to pathogens

INJURY, RISK FOR

Diagnostic Division: Safety

Definition: At risk of injury as a result of environmental conditions interacting with the individual's adaptive and defensive resources.

NOTE: The potential for injury differs from individual to individual, and situation to situation. It is our belief that the environment is not safe, and there is no way to list everything that might present a danger to someone. Rather, we believe nurses have the responsibility to educate people throughout their life cycles to live safely in their environment.

RISK FACTORS
Internal
Biochemical, regulatory function: (sensory, integrative, effector dysfunction; tissue hypoxia), immune/autoimmune dysfunction; malnutrition; abnormal blood profile, (leukocytosis/leukopenia; altered clotting factors; thrombocytopenia; sickle cell, thalassemia; decreased hemoglobin); Physical (broken skin, altered mobility); development age; (physiologic, psychosocial); Psychologic (affective, orientation)

External
Biologic: (immunization level of community, microorganism); Chemical pollutants, poisons, drugs, pharmaceutical agents, alcohol, caffeine, nicotine, preservatives, cosmetics, and dyes, nutrients (vitamins, food types); Physical (design, structure, and arrangement of community, building and/or equipment); mode of transport/transportation; People/provider (nosocomial agent; staffing patterns; cognitive, affective, and psychomotor factors)

INJURY, RISK FOR PERIOPERATIVE POSITIONING

Diagnostic Division: Safety

Definition: At risk for injury as a result of the environmental conditions found in the perioperative setting.

RISK FACTORS
Disorientation; sensory/perceptual disturbances due to anesthesia; Immobilization; muscle weakness; [pre-existing musculoskeletal conditions]; Obesity; Emaciation; Edema; [Elderly]

INTRACRANIAL ADAPTIVE CAPACITY, DECREASED

Diagnostic Division: Circulation

Definition: Intracranial fluid dynamic mechanisms that normally compensate for increases in intracranial volumes are compromised, resulting in repeated disproportionate increases in intracranial pressure (ICP) in response to a variety of noxious and non-noxious stimuli.

RELATED FACTORS
Brain injuries; Sustained increase in ICP equal to 10 to 15 mm Hg; Decreased cerebral perfusion pressure less than or equal to 50 to 60 mm Hg; Systemic hypotension with intracranial hypertension

DEFINING CHARACTERISTICS
Objective
Repeated increases in ICP of greater than 10 mm Hg for more than 5 min following a variety of external stimuli; Disproportionate increases in ICP following single environmental or nursing maneuver stimulus; Elevated P2 ICP waveform; Volume pressure response test variation (volume-pressure ratio greater than 2, pressure equals volume index less than 10); Baseline ICP equal to or greater than 10 mm Hg; Wide-amplitude ICP waveform [Altered level of consciousness—coma]; [Changes in vital signs, cardiac rhythm]

KNOWLEDGE, DEFICIENT [LEARNING NEED] (SPECIFY)

Diagnostic Division: Teaching/Learning

Definition: Absence or deficiency of cognitive information related to specific topic. [Lack of specific information necessary for patient/significant other(s) to make informed choices regarding condition/lifestyle changes.]

RELATED FACTORS
Lack of exposure; Information misinterpretation; Unfamiliarity with information resources; Lack of recall; Cognitive limitation; Lack of interest in learning; [Patient's request for no information]; [Inaccurate/incomplete information presented]

DEFINING CHARACTERISTICS

Subjective
Verbalization of the problem; [Statements reflecting misconceptions]; [Request for information]

Objective
Inaccurate follow-through of instruction; Inadequate performance of test; Inappropriate or exaggerated behaviors (e.g., hysterical, hostile, agitated, apathetic); [Development of preventable complication]

KNOWLEDGE (SPECIFY), READINESS FOR ENHANCED

Diagnostic Division: Teaching/Learning

Definition: The presence or acquisition of cognitive information related to a specific topic is sufficient for meeting health-related goals and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses an interest in learning; Explains knowledge of the topic; Describes previous experiences pertaining to the topic

Objective
Behaviors congruent with expressed knowledge

LONELINESS, RISK FOR

Diagnostic Division: Social Interaction

Definition: At risk for experiencing vague dysphoria.

RISK FACTORS
Affectional deprivation; Physical isolation; Cathectic deprivation; Social isolation

MEMORY, IMPAIRED

Diagnostic Division: Neurosensory

Definition: Inability to remember or recall bits of information or behavioral skills. May be attributed to pathophysiologic or situational causes that are either temporary or permanent.

RELATED FACTORS
Acute or chronic hypoxia; Anemia; Decreased cardiac output; Fluid and electrolyte imbalance [e.g., brain injury/concussion]; Neurological disturbances; Excessive environmental disturbances; [manic state, fugue, traumatic event]; [Substance use/abuse; effects of medications]; [Age]

DEFINING CHARACTERISTICS

Subjective
Reported experiences of forgetting; Inability to recall recent or past events, factual information [or familiar persons, places, items]

Objective
Observed experiences of forgetting; Inability to determine if a behavior was performed; Inability to learn or retain new skills or information; Inability to perform a previously learned skill; Forget to perform a behavior at a scheduled time

MOBILITY, IMPAIRED BED

Diagnostic Division: Safety

Definition: Limitation of independent movement from one bed position to another.

RELATED FACTORS
To be developed [/neuromuscular impairment]; [Pain/discomfort]

DEFINING CHARACTERISTICS

Subjective
[Reported difficulty performing activities]

Objective
Impaired ability to: turn side to side; move from supine to sitting or sitting to supine position; "scoot" or reposition self in bed; move from supine to prone or prone to supine position; move from supine to long sitting or long sitting to supine position

MOBILITY, IMPAIRED PHYSICAL

Diagnostic Division: Safety

Definition: A limitation in independent, purposeful physical movement of the body or of one or more extremities.

RELATED FACTORS
Sedentary lifestyle or disuse or deconditioning; limited cardiovascular endurance; Decreased muscle strength, control and/or mass; joint stiffness or contractures; loss of

integrity of bone structures; Intolerance to activity/decreased strength and endurance; Pain/discomfort; Neuromuscular/musculoskeletal impairment; Sensoriperceptual/cognitive impairment; developmental delay; Depressive mood state or anxiety; Selective or generalized malnutrition; altered cellular metabolism; body mass index above 75th age-appropriate percentile; Lack of knowledge regarding value of physical activity; cultural beliefs regarding age appropriate activity; lack of physical or social environmental supports; Prescribed movement restrictions; medications; Reluctance to initiate movement

DEFINING CHARACTERISTICS

Subjective
[Report of pain/discomfort on movement]

Objective
Limited range of motion; limited ability to perform gross/fine motor skills; difficulty turning; Slowed movement; uncoordinated or jerky movements, decreased [*sic*] reaction time; Gait changes (e.g., decreased walk, speed, difficulty initiating gait, small steps, shuffles feet, exaggerated lateral postural sway); Postural instability during performance of routine Activities of Daily Living; Movement-induced shortness of breath; Engages in substitutions for movement (e.g., increased attention to other's activity, controlling behavior, focus on pre-illness/disability activity)

MOBILITY, IMPAIRED WHEELCHAIR

Diagnostic Division: Safety

Definition: Limitation of independent operation of wheelchair within environment.

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS
Impaired ability to operate manual or power wheelchair on even or uneven surface, on an incline or decline, on curbs

NAUSEA

Diagnostic Division: Food/Fluid

Definition: A subjective, unpleasant, wavelike sensation in the back of the throat, epigastrium, or abdomen that may lead to the urge or need to vomit.

RELATED FACTORS
Treatment Related
Gastric irritation: Pharmaceuticals (e.g., aspirin, nonsteroidal anti-inflammatory drugs, steroids, antibiotics), alcohol, iron, and blood; Gastric distention: Delayed gastric emptying caused by pharmacological interventions (e.g., narcotics administration, anesthesia agents); Pharmaceuticals (e.g., analgesics, antivirals for HIV, aspirin, opioids, chemotherapeutic agents); Toxins (e.g., radiotherapy)

Biophysical
Biochemical disorders (e.g., uremia, diabetic ketoacidosis, pregnancy); Cardiac pain; Cancer of stomach or intra-abdominal tumors (e.g., pelvic or colorectal cancers); Esophageal or pancreatic disease; Gastric distention due to delayed gastric emptying, pyloric intestinal obstruction, genitourinary and biliary distension, upper bowel stasis, external compression of the stomach, liver, spleen, or other organ enlargement that slows the stomach functioning (squashed stomach syndrome), excess food intake; Gastric irritation due to pharyngeal and/or peritoneal inflammation; Liver or splenetic capsule stretch; Local tumors (e.g., acoustic neuroma, primary or secondary brain tumors, bone metastases at base of skull); Motion sickness, Meniere's disease, or labyrinthitis; Physical factors (e.g., increased intracranial pressure, meningitis); Toxins (e.g., tumor-produced peptides, abnormal metabolites due to cancer)

Situational
Psychological factors (e.g., pain, fear, anxiety, noxious odors, taste, unpleasant visual stimulation)

DEFINING CHARACTERISTICS

Subjective
Report of nausea ("sick to my stomach")

Objective
Increased salivation; Aversion toward food; Gagging sensation; Sour taste in mouth; Increased swallowing

NEGLECT, UNILATERAL

Diagnostic Division: Neurosensory

Definition: Lack of awareness of and inattention to one side of the body [and the immediate unilateral territory/space].

RELATED FACTORS
Effects of disturbed perceptual abilities (e.g., [homonymous] hemianopsia, one-sided blindness; [or visual inattention]); neurologic illness or trauma; [Impaired cerebral blood flow]

DEFINING CHARACTERISTICS

Subjective
[Reports feeling that part does not belong to own self]

Objective
Consistent inattention to stimuli on an affected side; Inadequate self-care [inability to satisfactorily perform activities of daily living]; [Lack of] Positioning and/or safety precautions in regard to the affected side; Does not look toward affected side; Leaves food on plate on the affected side; [Does not touch affected side]; [Failure to use the affected side of the body without being reminded to do so]

NONCOMPLIANCE [ADHERENCE, INEFFECTIVE] (SPECIFY)

Diagnostic Division: Teaching/Learning

Definition: Behavior of person and/or caregiver that fails to coincide with a health-promoting or therapeutic plan agreed upon by the person (and/or family, and/or community) and healthcare professional. In the presence of an agreed-on health-promoting or therapeutic plan, person's or caregiver's behavior is fully or partially adherent or nonadherent and may lead to clinically ineffective, partially ineffective outcomes.

NOTE: Noncompliance is a term that may create a negative situation for patient and caregiver that may foster difficulties in resolving the causative factors. As patients have a right to refuse therapy, we see this as a situation in which the professional need is to accept the patient's point of view/behavior/choice(s) and to work together to find alternate means to meet original and/or revised goals.

RELATED FACTORS
Health Care Plan
Duration; Significant others; cost; intensity; complexity

Individual factors
Personal and developmental abilities; knowledge and skills relevant to the regimen behavior; motivational forces; Individual's value system; health beliefs; cultural influences, spiritual values; [Altered thought processes such as depression, paranoia]; [Difficulty changing behavior, as in addictions]; [Issues of secondary gain]

Health System
Individual health coverage; financial flexibility of plan; credibility of provider; Client-provider relationships; provider continuity and regular follow-up; provider reimbursement of teaching and follow-up; communication and teaching skills of the provider; Access and convenience of care; satisfaction with care

Network
Involvement of members in health plan; social value regarding plan; Perceived beliefs of significant other's communication and teaching skills; [Altered thought processes such as depression, paranoia]; [Difficulty changing behavior, as in addictions]; [Issues of secondary gain]

DEFINING CHARACTERISTICS

Subjective
Statements by patient or significant other(s) [e.g., does not perceive illness/risk to be serious, does not believe in efficacy of therapy, unwilling to follow treatment regimen or accept side effects/limitations]

Objective
Behavior indicative of failure to adhere (by direct observation); Objective tests (physiologic measures, detection of markers); Failure to progress; Evidence of development of complications/exacerbation of symptoms; Failure to keep appointments; [Inability to set or to attain mutual goals]; [Denial]

NUTRITION: LESS THAN BODY REQUIREMENTS, IMBALANCED

Diagnostic Division: Food/Fluid

Definition: Intake of nutrients insufficient to meet metabolic needs.

RELATED FACTORS
Inability to ingest or to digest food or to absorb nutrients because of biologic, psychologic, or economic factors; [Increased metabolic demands (e.g., burns)]; [Lack of information, misinformation, misconception]

DEFINING CHARACTERISTICS

Subjective
Reported inadequate food intake less than RDA; Reported lack of food; Aversion to eating; satiety immediately after ingesting food; reported altered taste sensation; Abdominal pain with or without pathologic conditions; abdominal cramping; Lack of interest in food; perceived inability to ingest food; Lack of information; misinformation, misconceptions [NOTE: The authors view this as a related factor rather than a defining characteristic]

Objective
Body weight 20% or more under ideal [for height and frame]; Loss of weight with adequate food intake; Evidence of lack of [available] food; Weakness of muscles required for swallowing or mastication; Sore, inflamed buccal cavity; Poor muscle tone; Capillary fragility; Hyperactive bowel sounds; Diarrhea and/or steatorrhea; Pale conjunctiva and mucous membranes; Excessive loss of hair [or increased growth of hair on body (lanugo)]; [cessation of menses]; [Decreased subcutaneous fat/muscle mass]; [Abnormal laboratory studies (e.g., decreased albumin, total proteins; iron deficiency; electrolyte imbalances)]

NUTRITION: MORE THAN BODY REQUIREMENTS, IMBALANCED

Diagnostic Division: Food/Fluid

Definition: Intake of nutrients that exceeds metabolic needs.

RELATED FACTORS
Excessive intake in relationship to metabolic need

NOTE: Underlying cause is often complex and may be difficult to diagnose/treat

DEFINING CHARACTERISTICS

Subjective
Reported dysfunctional eating patterns: Pairing food with other activities; Eating in response to external cues such as time of day, social situation; Concentrating food intake at end of day; Eating in response to internal cues other than hunger (e.g., anxiety); Sedentary activity level

Objective
Weight 20% over ideal for height and frame [obese]; Triceps skinfold greater than 15 mm in men and 25 mm in women; Weight 10% over ideal for height and frame [overweight]; Observed dysfunctional eating patterns [as noted in Subjective]; [Percentage of body fat greater than 22% for trim women and 15% for trim men]

NUTRITION: READINESS FOR ENHANCED

Diagnostic Division: Food / Fluid

Definition: A pattern of nutrient intake that is sufficient for meeting metabolic needs and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance nutrition; Attitude toward eating and drinking is congruent with health goals; Expresses knowledge of healthy food and fluid choices

Objective
Eats regularly; Consumes adequate food and fluid; Follows an appropriate standard for intake (e.g., America Diabetic Association guidelines); Uses safe preparation and storage for food and fluids

NUTRITION: RISK FOR MORE THAN BODY REQUIREMENTS, IMBALANCED

Diagnostic Division: Food / Fluid

Definition: At risk for an intake of nutrients that exceeds metabolic needs.

RISK FACTORS
Reported/observed obesity in one or both parents [/spouse; hereditary predisposition]; Rapid transition across growth percentiles in infants or children [adolescents]; Reported use of solid food as major food source before 5 months of age; Reported/observed higher baseline weight at beginning of each pregnancy [frequent, closely spaced pregnancies]; Dysfunctional eating patterns: pairing food with other activities, eating in response to external cues such as time of day or social situation, concentrating food intake at end of day, eating in response to internal cues other than hunger (e.g., anxiety); Observed use of food as reward or comfort measure; [Frequent/repeated dieting]; [Socially/culturally isolated; lacking other outlets]; [Alteration in usual activity patterns/sedentary lifestyle]; [Alteration in usual coping patterns]; [Majority of foods consumed are concentrated, high-calorie sources/fat]; [Significant/sudden decline in financial resources; lower socioeconomic status]

ORAL MUCOUS MEMBRANE, IMPAIRED

Diagnostic Division: Food / Fluid

Definition: Disruptions of the lips and soft tissue of the oral cavity.

RELATED FACTORS
Pathological conditions—oral cavity (radiation to head or neck); cleft lip or palate; loss of supportive structures; Trauma; Mechanical (e.g., ill-fitting dentures, braces, tubes [endotracheal/nasogastric], surgery in oral cavity); Chemical (e.g., alcohol, tobacco, acidic foods, regular use of inhalers); Chemotherapy; immunosuppression/compromised; decreased platelets; infection; radiation therapy; Dehydration; malnutrition or vitamin deficiency; NPO for more than 24 hours; Lack of/impaired or decreased salivation; mouth breathing; Ineffective oral hygiene; barriers to oral self-care/professional care; Medication side effects; Stress; depression; Diminished hormone levels (women); aging-related loss of connective, adipose, or bone tissue

DEFINING CHARACTERISTICS

Subjective
Xerostomia (dry mouth); Oral pain/discomfort; Self-report of bad/diminished or absent taste; difficulty eating or swallowing

Objective
Coated tongue; smooth atrophic, sensitive tongue; geographic tongue; Gingival or mucosal pallor; Stomatitis; hyperemia; bleeding gingival hyperplasia; macroplasia; vesicles, nodules, or papules; White patches/plaques, spongy patches or white curd-like exudate; oral lesions or ulcers; fissures, cheilitis; desquamation; mucosal denudation; Edema; Hali-

tosis, [carious teeth]; Gingival recession, pockets deeper than 4 mm; Purulent drainage or exudates; presence of pathogens; Enlarged tonsils beyond what is developmentally appropriate; Red or bluish masses (e.g., hemangiomas); Difficult speech

PAIN, ACUTE

Diagnostic Division: Pain / Discomfort

Definition: An unpleasant sensory and emotional experience arising from actual or potential tissue damage or described in terms of such damage (International Association for the Study of Pain); sudden or slow onset of any intensity from mild to severe with an anticipated or predictable end and a duration of less than 6 months.

RELATED FACTORS
Injuring agents (biological, chemical, physical, psychological)

DEFINING CHARACTERISTICS

Subjective
Verbal or coded report; [may be less from patients under 40, men, and some cultural groups]; Changes in appetite and eating; [Pain unrelieved and/or increased beyond tolerance]

Objective
Guarded/protected behavior; antalgic position/gestures; Facial mask; sleep disturbance (eyes lack luster, beaten look," fixed or scattered movement, grimace); Expressive behavior (restlessness, moaning, crying, vigilance, irritability, sighing); Distraction behavior (pacing, seeking out other people and/or activities, repetitive activities); Autonomic alteration in muscle tone (may span from listless [flaccid] to rigid); Autonomic responses (diaphoresis, blood pressure, respiration and pulse changes, pupillary dilation); Self-focusing; Narrowed focus (altered time perception, impaired thought process, reduced interaction with people and environment); [Fear/panic]

PAIN, CHRONIC

Diagnostic Division: Pain / Comfort

Definition: An unpleasant sensory and emotional experience arising from actual or potential tissue damage or described in terms of such damage (International Association for the Study of Pain); sudden or slow onset of any intensity from mild to severe, constant or recurring without anticipated or predictable end and a duration of greater than 6 months.

NOTE: [Pain is a signal that something is wrong. Chronic pain can be recurrent and periodically disabling (e.g., migraine headaches) or may be unremitting. While chronic pain syndrome includes various learned behaviors, psychologic factors become the primary contribution to impairment. It is a complex entity, combining elements from other nursing diagnoses (e.g., Powerlessness; Diversional Activity, deficient; Family Processes, impaired; Self-care Deficit, and Disuse Syndrome, risk for).]

RELATED FACTORS
Chronic physical/psychosocial disability

DEFINING CHARACTERISTICS

Subjective
Verbal or coded report; Fear of reinjury; Altered ability to continue previous activities; Changes in sleep patterns; fatigue; [Changes in appetite]; [Preoccupation with pain]; [Desperately seeks alternative solutions/therapies for relief/control of pain]

Objective
Observed evidence of: protective/guarding behavior; facial mask; irritability; self-focusing; restlessness; depression; Reduced interaction with people; Anorexia, weight changes; Atrophy of involved muscle group; Sympathetic mediated responses (temperature, cold, changes of body position, hypersensitivity)

PARENTING, IMPAIRED

Diagnostic Division: Social Interaction

Definition: Inability of the primary caretaker to create an environment that promotes the optimum growth and development of the child. (It is important to state as

a preface to this diagnosis that adjustment to parenting in general is a normal maturational process that elicits nursing behaviors of prevention of potential problems and health promotion.)

RELATED FACTORS
Social
Presence of stress (e.g., financial, legal, recent crisis, cultural move [e.g., from another country/cultural group within same country]); unemployment or job problems; financial difficulties; relocations; poor home environments; Lack of family cohesiveness; marital conflict, declining satisfaction; change in family unit; Role strain or overload; single parent; father of child not involved; Unplanned or unwanted pregnancy; lack of, or poor, parental role model; low self-esteem; Low socioeconomic class; poverty; lack of resources, access to resources, social support networks, transportation; Inadequate child care arrangements; lack of value of parenthood; inability to put child's needs before own; Poor problem-solving skills; maladaptive coping strategies; Social isolation; History of being abusive/being abused; legal difficulties

Knowledge
Lack of knowledge about child health maintenance, parenting skills, child development; inability to recognize and act on infant cues; Unrealistic expectation for self, infant, partner; limited cognitive functioning; Low educational level or attainment; lack of cognitive readiness for parenthood; Poor communication skills; Preference for physical punishment

Physiological
Physical illness

Infant or Child
Premature birth; multiple births; unplanned or unwanted child; not gender desired; Illness; prolonged separation from parent/separation at birth; Difficult temperament; lack of goodness of fit (temperament) with parental expectations; Handicapping condition or developmental delay; altered perceptual abilities; attention deficit hyperactivity disorder

Psychological
Young age, especially adolescent; Lack of, or late, prenatal care; difficult labor and/or delivery; multiple births; high number or closely spaced pregnancies; Sleep deprivation or disruption; depression; Separation from infant/child; History of substance abuse or dependencies; Disability; history of mental illness

DEFINING CHARACTERISTICS

Subjective
Parental
Statements of inability to meet child's needs; cannot control child; Negative statements about child; Verbalization of role inadequacy frustration

Objective
Infant or Child
Frequent accidents/illness; failure to thrive; Poor academic performance/cognitive development; Poor social competence; behavioral disorders; Incidence of physical and psychological trauma or abuse; Lack of attachment; separation anxiety; Runaway

Parental
Maternal-child interaction deficit; poor parent-child interaction; little cuddling; insecure or lack of attachment to infant; Inadequate child health maintenance; unsafe home environment; inappropriate visual, tactile, auditory stimulation; Poor or inappropriate caretaking skills; inconsistent care/behavior management; Inflexibility to meet needs of child, situation; High punitiveness; rejection or hostility to child; child abuse; child neglect; abandonment

PARENTING, READINESS FOR ENHANCED

Diagnostic Division: Social Interaction

Definition: A pattern of providing an environment for children or other dependent persons that is sufficient to nurture growth and development and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance parenting; Children or other dependent persons express satisfaction with home environment

Objective
Emotional and tacit support of children or dependent persons is evident; Bonding or attachment is evident; Physical and emotional needs of children/dependent persons are met; Realistic expectations of children/ dependent persons are exhibited

PARENTING, RISK FOR IMPAIRED

Diagnostic Division: Social Interaction

Definition: Risk for inability of the primary caretaker to create, maintain, or regain an environment that promotes the optimum growth and development of the child. (It is important to state as a preface to this diagnosis that adjustment to parenting in general is a normal maturational process that elicits nursing behaviors of prevention of potential problems and health promotion.)

RISK FACTORS

NOTE: Lack of role identity; lack of available role model, ineffective role model

Social
Stress [e.g., financial, legal, recent crisis, cultural move (e.g., from another country/ cultural group in same country)]; unemployment or job problems; financial difficulties; relocations; poor home environments; Lack of family cohesiveness; marital conflict, declining satisfaction; change in family unit; Role strain/overload; single parents; father or child not involved; Unplanned or unwanted pregnancy; lack of, or poor, parental role model; low self-esteem; Low socioeconomic class; poverty; lack of [resources], access to resources, social support networks, transportation; inadequate child care arrangements; lack of value of parenthood; inability to put child's needs before own; Poor problem-solving skills; maladaptive coping strategies; Social isolation; History of being abusive/being abused; legal difficulties

Knowledge
Lack of knowledge about child health maintenance, parenting skills, child development; inability to recognize and act on infant cues; Unrealistic expectations of child; Low educational level or attainment; low cognitive functioning; lack of cognitive readiness for parenthood; Poor communication skills; Preference for physical punishment

Physiological
Physical illness

Infant or child
Premature birth; multiple births; unplanned or unwanted child; not gender desired; Illness; prolonged separation from parent/separation at birth; Difficult temperament; lack of goodness of fit (temperament) with parental expectations; Handicapping condition or developmental delay; altered perceptual abilities; attention deficit hyperactivity disorder

Psychological
Young age, especially adolescent; Lack of, or late, prenatal care; difficult labor and/or delivery; multiple births; high number or closely spaced pregnancies; Sleep deprivation or disruption; depression; Separation from infant/child; History of substance abuse or dependence; Disability; history of mental illness

PERIPHERAL NEUROVASCULAR DYSFUNCTION, RISK FOR

Diagnostic Division: Neurosensory

Definition: At risk of experiencing a disruption in circulation, sensation, or motion of an extremity.

RISK FACTORS
Fractures; Mechanical compression (e.g., tourniquet, cast, brace, dressing, or restraint); Orthopedic surgery; trauma; Immobilization; Burns; Vascular obstruction

POISONING, RISK FOR

Diagnostic Division: Safety

Definition: Accentuated risk of accidental exposure to or ingestion of drugs or dangerous products in doses sufficient to cause poisoning [/or the adverse effects of prescribed medication/drug use].

RISK FACTORS
Internal (individual)
Reduced vision; Lack of safety or drug education; Lack of proper precaution [unsafe habits, disregard for safety measures, lack of supervision]; Insufficient finances; Verbalization of occupational setting without adequate safeguards; Cognitive or emotional difficulties [behavioral]; [Age (e.g., young child, elderly)]; [Chronic disease state, disability]; [Cultural or religious beliefs/practices]

External (Environmental)
Large supplies of drugs in house; Medicines stored in unlocked cabinets accessible to children or confused persons; Availability of illicit drugs potentially contaminated by poisonous additives; Flaking, peeling paint or plaster in presence of young children; Dangerous products placed or stored within the reach of children or confused persons; Unprotected contact with heavy metals or chemicals; Paint, lacquer, etc., in poorly ventilated areas or without effective protection; Chemical contamination of food and water; Presence of poisonous vegetation; Presence of atmospheric pollutants, [proximity to industrial chemicals/pattern of prevailing winds]; [Therapeutic margin of safety of specific drugs (e.g., therapeutic versus toxic level, half-life, method of uptake and degradation in body, adequacy of organ function)]; [Use of multiple herbal supplements or megadosing]

POST-TRAUMA SYNDROME

Diagnostic Division: Ego Integrity

Definition: A sustained maladaptive response to a traumatic, overwhelming event.

RELATED FACTORS
Events outside the range of usual human experience; Serious threat or injury to self or loved ones; serious accidents; industrial and motor vehicle accidents; Physical and psychosocial abuse; rape; Witnessing mutilation, violent death, or other horrors; tragic occurrence involving multiple deaths; Natural disasters and/or man-made disasters; sudden destruction of one's home or community; epidemics; Wars; military combat; being held prisoner of war or criminal victimization (torture)

DEFINING CHARACTERISTICS

Subjective
Intrusive thoughts/dreams; flashbacks; nightmares; Palpitations; headaches; [loss of interest in usual activities, loss of feeling of intimacy/sexuality]; Hopelessness; shame; [excessive verbalization of the traumatic event, verbalization of survival guilt or guilt about behavior required for survival]; Gastric irritability; [changes in appetite; sleep disturbance/insomnia; chronic fatigue/easy fatigability]

Objective
Anxiety; fear; Hypervigilant; exaggerated startle response; neurosensory irritability; irritability; Grief; guilt; Difficulty in concentrating; depression; Anger and/or rage; aggression; Avoidance; repression; alienation; denial; detachment; psychogenic amnesia; numbing; Altered mood states; [poor impulse control/irritability and explosiveness]; panic attacks; horror; Substance abuse; compulsive behavior; Enuresis (in children); [Difficulty with interpersonal relationships; dependence on others; work/school failure]

POST-TRAUMA SYNDROME, RISK FOR

Diagnostic Division: Ego Integrity

Definition: A risk for sustained maladaptive response to a traumatic, overwhelming event.

RISK FACTORS
Occupation (e.g., police, fire, rescue, corrections, emergency room staff, mental health [and their family members]); Perception of event; exaggerated sense of responsibility; diminished ego strength; Survivor's role in the event; Inadequate social support; non-supportive environment; displacement from home; Duration of the event

POWERLESSNESS [SPECIFY LEVEL]

Diagnostic Division: Ego Integrity

Definition: Perception that one's own action will not significantly affect an outcome; a perceived lack of control over a current situation or immediate happening.

RELATED FACTORS
Health care environment [e.g., loss of privacy, personal possessions, control over therapies]; Interpersonal interaction [e.g., misuse of power, force; abusive relationships]; Illness-related regimen [e.g., chronic/debilitating conditions]; Lifestyle of helplessness [e.g., repeated failures, dependency]

DEFINING CHARACTERISTICS

Subjective
Severe
Verbal expressions of having no control or influence over situation, outcome, or self-care; Depression over physical deterioration that occurs despite patient compliance with regimens

Moderate
Expressions of dissatisfaction and frustration over inability to perform previous tasks and/or activities; Expression of doubt regarding role performance; Reluctance to express true feelings, fear of alienation from caregivers

Low
Expressions of uncertainty about fluctuating energy levels

Objective
Severe
Apathy [withdrawal, resignation, crying]; [Anger]

Moderate
Does not monitor progress; Nonparticipation in care or decision making when opportunities are provided; Dependence on others that may result in irritability, resentment, anger, and guilt; Inability to seek information regarding care; Does not defend self-care practices when challenged

Low
Passivity

POWERLESSNESS, RISK FOR

Diagnostic Division: Ego Integrity

Definition: Risk for perceived lack of control over situation and/or ability to significantly affect an outcome.

RISK FACTORS
Physiological
Chronic or acute illness (hospitalization, intubation, ventilator, suctioning); Dying; Actue injury or progressive debilitating disease process (e.g., spinal cord injury, multiple sclerosis); Aging (e.g., decreased physical strength, decreased mobility)

Psychosocial
Lack of knowledge of illness or healthcare system; Lifestyle of dependency with inadequate coping patterns; Absence of integrality (e.g., essence of power); Decreased self-esteem; Low or unstable body image

PROTECTION, INEFFECTIVE

Diagnostic Division: Safety

Definition: Decrease in the ability to guard self from internal or external threats such as illness or injury.

RELATED FACTORS
Extremes of age; Inadequate nutrition; Alcohol abuse; Abnormal blood profiles (leukopenia, thrombocytopenia, anemia, coagulation); Drug therapies (antineoplastic, corticosteroid, immune, anticoagulant, thrombolytic); Treatments (surgery, radiation); Diseases, such as cancer and immune disorders

DEFINING CHARACTERISTICS

Subjective
Neurosensory alterations; Chilling; Itching; Insomnia; fatigue; weakness; Anorexia

Objective
Deficient immunity; Impaired healing; altered clotting; Maladaptive stress response; Perspiring [inappropriate]; Dyspnea; cough; Restlessness; immobility; Disorientation; Pressure sores

[NOTE: The purpose of this diagnosis seems to be to combine multiple diagnoses under a single heading for ease of planning care when a number of variables may be present. Outcomes/evaluation criteria and interventions are specifically tied to individual related factors that are present, such as: Extremes of age: Concerns may include body temperature/thermoregulation or thought process/sensory-perceptual alterations, as well as risk for trauma, suffocation, or poisoning; and fluid volume imbalances; Inadequate nutrition: Brings up issues of nutrition, less than body requirements; infection, altered thought processes, trauma, ineffective coping, and altered family processes; Alcohol abuse: May be situational or chronic with problems ranging from ineffective breathing patterns, decreased cardiac output, and fluid volume deficit to nutritional problems, infection, trauma, altered thought processes, and coping/family process difficulties; Abnormal blood profile: Suggests possibility of fluid volume deficit, decreased tissue perfusion, impaired gas exchange, activity intolerance, or risk for infection; Drug therapies, treatments, and disease concerns: Would include risk for infection, fluid volume imbalances, altered skin/tissue integrity, pain, nutritional problems, fatigue, and emotional responses. It is suggested that the user refer to specific nursing diagnoses based on identified related factors and individual concerns for this patient in order to find appropriate outcomes and interventions.]

RAPE-TRAUMA SYNDROME

Diagnostic Division: Ego Integrity

Definition: Sustained maladaptive response to a forced, violent sexual penetration against the victim's will and consent. [The trauma syndrome that develops from this attack or attempted attack includes an acute phase of disorganization of the victim's lifestyle and a long-term process of reorganization of lifestyle.]

NOTE: Although attacks are most often directed toward women, men also may be victims.

RELATED FACTORS
Rape [actual/attempted forced sexual penetration

DEFINING CHARACTERISTICS

Subjective
Loss of self-esteem; helplessness; powerlessness; Nightmare and sleep disturbances; Change in relationships; sexual dysfunction

Objective
Physical trauma (e.g., bruising, tissue irritation); muscle tension and/or spasms; Confusion; disorganization; inability to make decisions; Agitation; hyperalertness; aggression; Mood swings; vulnerability; dependence; depression; Substance abuse; suicide attempts; Denial; phobias; dissociative disorders

RAPE-TRAUMA SYNDROME: COMPOUND REACTION

Diagnostic Division: Ego Integrity

Definition: Forced violent sexual penetration against the victim's will and consent. The trauma syndrome that develops from this attack or attempted attack includes an acute phase of disorganization of the victim's lifestyle and a long-term process of reorganization of lifestyle.

RELATED FACTORS
To be developed.

DEFINING CHARACTERISTICS
Acute Phase
Emotional reaction (e.g., anger, embarrassment, fear of physical violence and death, humiliation, self-blame, thoughts of revenge); Multiple physical symptoms (e.g., gastrointestinal irritability, genitourinary discomfort, muscle tension, sleep pattern disturbance); Reactivated symptoms of such previous conditions (i.e., physical/psychiatric illness, reliance on alcohol and/or drugs)

Long-Term Phase
Change in lifestyles (e.g., changing residence, dealing with repetitive nightmares and phobias, seeking family/social network support)

RAPE-TRAUMA SYNDROME: SILENT REACTION

Diagnostic Division: Ego Integrity

Definition: Forced violent sexual penetration against the victim's will and consent. The trauma syndrome that develops from this attack or attempted attack includes an acute phase of disorganization of the victim's lifestyle and a long-term process of reorganization of lifestyle.

RELATED FACTORS
To be developed.

DEFINING CHARACTERISTICS
Abrupt changes in relationships with men; Increase in nightmares; Increased anxiety during interview (i.e., blocking of associations, long periods of silence, minor stuttering, physical distress); Pronounced changes in sexual behavior; Sudden onset of phobic reactions; No verbalization of the occurrence of rape

RELOCATION STRESS SYNDROME

Diagnostic Division: Ego Integrity

Definition: Physiologic and/or psychological disturbances as a result of transfer from one environment to another.

RELATED FACTORS
Past, concurrent, and recent losses; losses involved with decision to move; Feeling of powerlessness; Lack of adequate support system; Little or no preparation for the impending move; Moderate to high degree of environmental change; History and types of previous transfers; Impaired psychosocial health status; Decreased physical health status

DEFINING CHARACTERISTICS

Subjective
Anxiety; Apprehension; Depression; Loneliness; Verbalization of unwillingness to relocate; Sleep disturbance; Change in eating habits; Gastrointestinal disturbances; Insecurity; Lack of trust; Unfavorable comparison of post-transfer/pre-transfer staff; Verbalization of being concerned/upset [angry] about transfer

Objective
Change in environment/location; Increased confusion (elderly population) [/cognitively impaired]; Increased (frequency of) verbalization of needs; Dependency; Sad affect; Vigilance; Weight change; Withdrawal; Hostile behavior/outbursts

RELOCATION STRESS SYNDROME, RISK FOR

Diagnostic Division: Ego Integrity

Definition: Risk for maladaptive response to transfer from one environment to another.

DEFINING CHARACTERISTICS
To be developed.

ROLE PERFORMANCE, INEFFECTIVE

Diagnostic Division: Social Interaction

Definition: The patterns of behavior and self-expression do not match the environmental context, norms, and expectations. [There is a typology of roles: sociopersonal (friendship, family, marital, parenting, community), home management, intimacy (sexuality, relationship building), leisure/exercise/recreation, self-management, socialization (developmental transitions), community contributor, and religious.]

RELATED FACTORS

Social

Inadequate role socialization (e.g., role model, expectations, responsibilities); Young age, developmental level; Lack of resources; low socioeconomic status; poverty; Stress and conflict; job schedule demands; Family conflict; domestic violence; Inadequate support system; lack of rewards; Inadequate or inappropriate linkage with the health care system

Knowledge

Lack of knowledge about role/role skills; lack of or inadequate role model; Inadequate role preparation (e.g., role transition, skill, rehearsal, validation); lack of opportunity for role rehearsal; Education attainment level; developmental transitions; Role transition; unrealistic role expectations

Physiological

Health alterations (e.g., physical health, body image, self-esteem, mental health, psychosocial health, cognition, learning style, neurological health); low self-esteem; pain; fatigue; depression; Substance abuse; Inadequate/inappropriate linkage with health care system

DEFINING CHARACTERISTICS

Subjective

Altered role perceptions/change in self-perception of role/usual patterns of responsibility/capacity to resume role/other's perception of role; inadequate opportunities for role enactment; role dissatisfaction; overload; denial; discrimination [by others]; powerlessness

Objective

Inadequate knowledge; inadequate role competency and skills; inadequate adaptation to change or transition; inappropriate developmental expectations; inadequate confidence; inadequate motivation; inadequate self-management; inadequate coping; inadequate opportunities/external support for role enhancement; role strain; role conflict; role confusion; role ambivalence; [failure to assume role]; uncertainty; anxiety or depression; pessimistic; domestic violence; harassment; system conflict

SELF-CARE DEFICIT, BATHING/HYGIENE

Diagnostic Division: Hygiene

Definition: Impaired ability to perform or complete bathing/hygiene activities for oneself.

RELATED FACTORS

Decreased or lack of motivation; weakness and tiredness; Severe anxiety; Inadequate to perceive body part or spatial relationship; Perceptual or cognitive impairment; Pain; Neuromuscular/musculoskeletal impairment; Environmental barriers

DEFINING CHARACTERISTICS

Inability to get bath supplies; Inability to wash body or body parts; Inability to obtain or get to water source, regulate temperature or flow of bath water; Inability to get in and out of bathroom [tub]; Inability to dry body

SELF-CARE DEFICIT, DRESSING/GROOMING

Diagnostic Division: Hygiene

Definition: An impaired ability to perform or complete dressing and grooming activities for oneself.

RELATED FACTORS
Weakness or tiredness; decreased or lack of motivation; Pain; discomfort; Severe anxiety; Perceptual or cognitive impairment neuromuscular/musculoskeletal impairment; Environmental barriers

DEFINING CHARACTERISTICS
Inability to choose clothing, pick up clothing, use assistive devices; Impaired ability/inability to put on or take off necessary items of clothing on upper/lower body; put on socks/shoes; Impaired ability to obtain or replace articles of clothing, fasten clothing, use zippers; Inability to maintain appearance at a satisfactory level

SELF-CARE DEFICIT, FEEDING

Diagnostic Division: Hygiene

Definition: An impaired ability to perform or complete feeding activities.

RELATED FACTORS
Weakness or tiredness; Severe anxiety; Neuromuscular impairment; Pain; discomfort; Perceptual or cognitive impairment; Environmental barriers; Decreased or lack of motivation; Musculoskeletal impairments

DEFINING CHARACTERISTICS
Inability to prepare food for ingestion, open containers; Inability to handle utensils, get food onto utensil safely, bring food from a receptacle to the mouth; Inability to manipulate food in mouth, chew/swallow food; Inability to pick up cup or glass; Inability to use assistive device; Inability to complete a meal; Inability to ingest food in a socially acceptable manner

SELF-CARE DEFICIT, TOILET

Diagnostic Division: Hygiene

Definition: An impaired ability to perform or complete own toileting activities.

RELATED FACTORS
Environmental barriers; Weakness or tiredness; decreased or lack of motivation; Severe anxiety; Impaired mobility status; Impaired transfer ability; Neuromuscular/musculoskeletal impairment; Pain; Perceptual or cognitive impairment

DEFINING CHARACTERISTICS
Inability to manipulate clothing; Unable to carry out proper toilet hygiene; Unable to sit on or rise from toilet or commode; Unable to get to toilet or commode; Unable to flush toilet or [empty] commode

SELF-CONCEPT, READINESS FOR ENHANCED

Diagnostic Division: Ego Integrity

Definition: A pattern of perceptions or ideas about the self that is sufficient for well-being and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance self-concept; Expresses satisfaction with thoughts about self, sense of worthiness, role performance, body image, and personal identity; Expresses confidence in abilities; Accepts strengths and limitations

Objective
Actions are congruent with expressed feelings and thoughts

SELF-ESTEEM, CHRONIC LOW

Diagnostic Division: Ego Integrity

Definition: Long-standing negative self-evaluation/feelings about self or self-capabilities.

RELATED FACTORS
To be developed: [Fixation in earlier level of development]; [Continual negative evaluation of self/capabilities from childhood]; [Personal vulnerability]; [Life choices perpetuating failure; ineffective social/occupational functioning]; [Feelings of abandonment by significant other; willingness to tolerate possibly life-threatening domestic violence]; [Chronic physical/psychiatric conditions; antisocial behaviors]

DEFINING CHARACTERISTICS

Subjective
(Long-standing or chronic:) Self-negating verbalization; Expressions of shame and guilt; Evaluates self as unable to deal with events; Rationalizes away/rejects positive feedback and exaggerates negative feedback about self.

Objective
Hesitant to try new things/situations (long-standing or chronic); Frequent lack of success in work and other life events; Overly conforming, dependent on others' opinions; Lack of eye contact; Nonassertive/passive; indecisive; Excessively seeks reassurance

SELF-ESTEEM, SITUATIONAL LOW

Diagnostic Division: Ego Integrity

Definition: Development of a negative perception of self-worth in response to a current situation (specify).

RELATED FACTORS
Developmental changes (specify); [Maturational transitions, adolescence, aging]; Functional impairments; Disturbed body image; Loss (specify) [e.g., loss of health status, body part, independent functioning, memory deficit/cognitive impairment]; Social role changes (specify); Failure/rejections; lack of recognition/rewards; [feelings of abandonment by SO] Behavior inconsistent with values

DEFINING CHARACTERISTICS

Subjective
Reports current situational challenge of self-worth; Expressions of helplessness and uselessness; Evaluation of self as unable to deal with situations or events

Objective
Self-negating verbalizations; Difficulty making decisions

SELF-ESTEEM, SITUATIONAL LOW, RISK FOR

Diagnostic Division: Ego Integrity

Definition: Risk for developing a negative perception of self-worth in response to a current situation. (specify situation)

RISK FACTORS
Developmental changes (specify); Disturbed body image; Functional impairment (specify); Loss (specify); Social role changes (specify); History of learned helplessness; Neglect or abandonment; Unrealistic self-expectations; Behavior inconsistent with values; Lack of recognition/rewards; Failures/rejections; Decreased power/control over environment; Physical illness (specify)

SELF-MUTILATION

Diagnostic Division: Safety

Definition: Deliberate, self-injurious behavior causing tissue damage with the intent of causing nonfatal injury to attain relief of tension.

DEFINING CHARACTERISTICS
To be developed by NANDA.

SELF-MUTILATION, RISK FOR

Diagnostic Division: Safety

Definition: At risk for deliberate self-injurious behavior causing tissue damage with the intent of causing nonfatal injury to attain relief of tension.

RISK FACTORS
Groups at Risk
Clients with borderline personality disorder, especially females 16 to 25 years of age; Clients in psychotic state—frequently males in young adulthood; Emotionally disturbed and/or battered children; [Clients with organic conditions, e.g.,] mental retardation and autism, [encephalitis, Tourette's syndrome, acute intoxication, Addison's disease]; Clients with a history of self-injury; Clients with a history of physical, emotional, or sexual abuse
Inability to cope with increased psychological-physiologic tension in a healthy manner; Feelings of depression, rejection, self-hatred, separation anxiety, guilt, and depersonalization; Fluctuating emotions; Command hallucinations; Need for sensory stimuli; Parental emotional deprivation; Dysfunctional family; [Difficulty achieving adolescent task of separation]

SENSORY/PERCEPTION, DISTURBED (SPECIFY: VISUAL, AUDITORY, KINESTHETIC, GUSTATORY, TACTILE, OLFACTORY)

Diagnostic Division: Neurosensory

Definition: Change in the amount or patterning of incoming stimuli accompanied by a diminished, exaggerated, distorted, or impaired response to such stimuli.

RELATED FACTORS
Excessive/insufficient environmental stimuli; [Therapeutically restricted environments (e.g., isolation, intensive care, bedrest, traction, confining illnesses, incubator)]; [Socially restricted environment (e.g., institutionalization, homebound, aging, chronic/terminal illness, infant deprivation); stigmatized (e.g., mentally ill/retarded/handicapped); bereaved]; [Excessive noise level such as work environment, patient's immediate environment (ICU with support machinery and the like)]; Altered sensory reception, transmission, and/or integration; [Neurological disease, trauma, or deficit]; [Altered status of sense organs]; [Inability to communicate, understand, speak, or respond]; [Sleep deprivation]; [Pain, (phantom limb)]; Biochemical imbalances; Electrolyte imbalance; [elevated BUN, elevated ammonia, hypoxia], [drugs, (e.g., stimulants or depressants, mind-altering drugs)]; Psychological stress [narrowed perceptual fields caused by anxiety]; Altered sensory perception

DEFINING CHARACTERISTICS

Subjective
Reported change in sensory acuity [e.g., photosensitivity, hypoesthesias, diminished/altered sense of taste, inability to tell position of body parts (proprioception), visual/auditory distortions]; [Distortion of pain (e.g., exaggerated, lack of)]

Objective
Measured change in sensory acuity; Change in usual response to stimuli, [rapid mood swings, exaggerated emotional responses, anxiety/panic state, motor incoordination, altered sense of balance/falls (e.g., Ménière's syndrome)]; Change in problem-solving abilities; poor concentration; Disoriented in time, in place, or with people; Altered communication patterns; Change in behavior pattern; Restlessness; irritability; Hallucinations; [illusions]; [bizarre thinking]

SEXUAL DYSFUNCTION

Diagnostic Division: Sexuality

Definition: Change in sexual function that is viewed as unsatisfying, unrewarding, or inadequate.

RELATED FACTORS
Biopsychosocial alteration of sexuality: Ineffectual or absent role models; Lack of significant other; Vulnerability; Misinformation or lack of knowledge; Physical/psychosocial abuse (e.g., harmful relationships); Values conflict; Lack of privacy; Altered body structure or function (pregnancy, recent childbirth, drugs, surgery, anomalies, disease process, trauma, [paraplegia/quadriplegia], radiation, [effects of aging])

DEFINING CHARACTERISTICS

Subjective
Verbalization of problem [e.g., loss of sexual desire, disruption of sexual response patterns such as premature ejaculation, dyspareunia, vaginismus]; Actual or perceived

limitation imposed by disease and/or therapy; Inability to achieve desired satisfaction; Alterations in achieving perceived sex role; Conflicts involving values; Alterations in achieving sexual satisfaction; Seeking of confirmation of desirability

Objective
Alteration in relationship with significant other; Change of interest in self and others

SEXUALITY PATTERNS, INEFFECTIVE

Diagnostic Division: Sexuality

Definition: Expressions of concern regarding one's own sexuality.

RELATED FACTORS
Knowledge/skill deficit about alternative responses to health-related transitions, altered body function or structure, illness or medical [treatment]; Lack of privacy; Impaired relationship with a significant other; Lack of significant other; Ineffective or absent role models; Conflicts with sexual orientation or variant preferences; Fear of pregnancy or of acquiring a sexually transmitted disease

DEFINING CHARACTERISTICS

Subjective
Reported difficulties, limitations, or changes in sexual behaviors or activities; [Expressions of feeling of alienation, loneliness, loss, powerlessness, anger]

SKIN INTEGRITY, IMPAIRED

Diagnostic Division: Safety

Definition: Altered epidermis and/or dermis. [The integumentary system is the largest multifunctional organ of the body.]

RELATED FACTORS
External
Hyperthermia or hypothermia; Chemical substance; radiation; medications; Physical immobilization; Humidity; moisture [excretions/secretions]; Altered fluid status; Mechanical factors (e.g., shearing forces, pressure, restraint), [trauma (e.g., injury/surgery); Extremes in age

Internal
Altered nutritional state (e.g., obesity, emaciation); altered metabolic state, pigmentation, circulation, sensation; Skeletal prominence; alterations in turgor (changes in elasticity); Developmental factors; Immunological deficit; [Psychogenic]

DEFINING CHARACTERISTICS

Subjective
[Reports of itching, pain, numbness of affected/surrounding area]

Objective
Disruption of skin surface (epidermis); Destruction of skin layers (dermis); Invasion of body structures

SKIN INTEGRITY, IMPAIRED, RISK FOR

Diagnostic Division: Safety

Definition: At risk of being adversely altered.

RISK FACTORS
External
Chemical substance; radiation; Hypothermia or hyperthermia; Physical immobilization; Excretions and/or secretions; humidity; moisture; Mechanical factors (e.g., shearing forces, pressure, restraint); Extremes of age

Internal
Medication; Alterations in nutritional state (e.g., obesity, emaciation); alterations in metabolic state, circulation, sensation, pigmentation; Skeletal prominence; alterations in skin turgor (changes in elasticity); [presence of edema]; Developmental factors; Psychogenetic; Immunologic

SLEEP, READINESS FOR ENHANCED

Diagnostic Division: Activity / Rest

Definition: A pattern of natural, periodic suspension of consciousness that provides adequate rest, sustains a desired lifestyle, and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance sleep; Expresses a feeling of being rested after sleep; Follows sleep routines that promote sleep habits

Objective
Amount of sleep and REM (rapid eye movement) sleep is congruent with developmental needs; Occasional or infrequent use of medications to induce sleep

SLEEP DEPRIVATION

Diagnostic Division: Activity / Rest

Definition: Prolonged periods of time without sustained natural, periodic suspension of relative unconsciousness [consciousness].

RELATED FACTORS
Sustained environmental stimulation; sustained unfamiliar or uncomfortable sleep environment; sustained circadian asynchrony; Inadequate daytime activity; aging-related sleep stage shifts; nonsleep-inducing parenting practices; Sustained inadequate sleep hygiene; prolonged use of pharmacologic or dietary antisoporifics; Prolonged physical/psychological discomfort; periodic limb movement (e.g., restless leg syndrome, nocturnal myoclonus); sleep-related enuresis; sleep-related painful erections; Nightmares; sleep walking; sleep terror; Sleep apnea; Sundowner's syndrome; dementia; Idiopathic central nervous system hypersomnolence; narcolepsy; familial sleep paralysis

DEFINING CHARACTERISTICS

Subjective
Daytime drowsiness; decreased ability to function; Malaise; tiredness; lethargy; Anxious; Perceptual disorders (e.g., disturbed body sensation, delusions, feeling afloat); heightened sensitivity to pain

Objective
Restlessness; irritability; Inability to concentrate; slowed reaction; Listlessness; apathy; Mild, fleeting nystagmus; hand tremors; Acute confusion; transient paranoia; agitated or combative; hallucinations

SLEEP PATTERN, DISTURBED

Diagnostic Division: Activity / Rest

Definition: Time-limited disruption of sleep (natural, periodic suspension of consciousness) amount and quality.

RELATED FACTORS
Psychological
Daytime activity pattern; fatigue; dietary; body temperature; Social schedule inconsistent with chronotype; shift work; daylight/darkness exposure; Frequently changing sleep-wake schedule/travel across time zones; circadian asynchrony; Childhood onset; aging-related sleep shifts; periodic gender-related hormonal shifts; Inadequate sleep hygiene; maladaptive conditioned wakefulness; Ruminative pre-sleep thoughts; anticipation; thinking about home; Preoccupation with trying to sleep; fear of insomnia; Biochemical agents; medications; sustained use of anti-sleep agents; Temperament; loneliness; grief; anxiety; fear; boredom; depression; Separation from significant others; loss of sleep partner, life change; Delayed or advanced sleep phase syndrome

Environmental
Excessive stimulation; noise; lightning; ambient temperature; humidity; noxious odors; Unfamiliar sleep furnishings; Privacy control; sleep partner; Nurse for therapeutics, monitoring, lab tests; other-generated awakening; Physical restraint; Lack of sleep

Parental
Mother's sleep-wake pattern/emotional support; Parent-infant interaction

Physiological
Position; wet; fever; Gastroesophageal reflux; nausea; Shortness of breath; stasis of secretions; Urinary urgency

DEFINING CHARACTERISTICS

Subjective
Verbal complaints [reports] of difficulty falling asleep/not feeling well rested; dissatisfaction with sleep; Sleep onset greater than 30 minutes; Three or more nighttime awakenings; prolonged awakenings; Awakening earlier or later than desired; early morning insomnia; Decreased ability to function; [falling asleep during activities]

Objective
Less than age-normed total sleep time; Increased proportion of Stage 1 sleep; Decreased proportion of Stages 3 and 4 sleep (e.g., hyporesponsiveness, excess sleepiness, decreased motivation); Decreased proportion of REM sleep (e.g., REM rebound, hyperactivity, emotional lability, agitation and impulsivity, atypical polysomnographic features); Sleep maintenance insomnia; Self-induced impairment of normal pattern; [Changes in behavior and performance (increasing irritability, disorientation, listlessness, restlessness, lethargy)]; [Physical signs (mild fleeting nystagmus, ptosis of eyelid, slight hand tremor, expressionless face, dark circles under eyes, changes in posture, frequent yawning)]

SOCIAL INTERACTION, IMPAIRED

Diagnostic Division: Social Interaction

Definition: Insufficient or excessive quantity or ineffective quality of social exchange.

RELATED FACTORS
Knowledge/skill deficit about ways to enhance mutuality; Communication barriers [including head injury, stroke, other neurologic conditions affecting ability to communicate]; Self-concept disturbance; Absence of available significant others or peers; Limited physical mobility [e.g., neuromuscular disease]; Therapeutic isolation; Sociocultural dissonance; Environmental barriers; Altered thought processes

DEFINING CHARACTERISTICS

Subjective
Verbalized discomfort in social situations; Verbalized inability to receive or communicate a satisfying sense of belonging, caring, interest, or shared history; Family report of change of style or pattern of interaction

Objective
Observed discomfort in social situations; Observed inability to receive or communicate a satisfying sense of belonging, caring, interest, or shared history; Observed use of unsuccessful social interaction behaviors; Dysfunctional interaction with peers, family, and/or others

SOCIAL ISOLATION

Diagnostic Division: Social Interaction

Definition: Aloneness experienced by the individual and perceived as imposed by others and as a negative or threatened state.

RISK FACTORS
Factors contributing to the absence of satisfying personal relationships, such as the following: Delay in accomplishing developmental tasks; Alterations in mental status; Altered state of wellness; Immature interests; Alterations in physical appearance; Unaccepted social behavior/values; Inadequate personal resources; Inability to engage in satisfying personal relationships; [Traumatic incidents or events causing physical and/or emotional pain]

DEFINING CHARACTERISTICS

Subjective
Expresses feeling of aloneness imposed by others; Expresses values acceptable to subculture, but unable to accept values of dominant culture; Inability to meet expecta-

tions of others; Expresses feelings of rejection; Experiences feelings of difference from others; Inadequacy in or absence of significant purpose in life; Expresses interests inappropriate to developmental age/stage; Insecurity in public

Objective
Absence of supportive significant other(s)—family, friends, group; Sad, dull affect; Inappropriate or immature interests/activities for developmental age/stage; Hostility projected in voice, behavior; Evidence of physical/mental handicap or altered state of wellness; Uncommunicative, withdrawn; no eye contact; Preoccupation with own thoughts; repetitive, meaningless actions; Seeking to be alone or exists in subculture; Shows behavior unaccepted by dominant cultural group

SORROW, CHRONIC

Diagnostic Division: Ego Integrity

Definition: A cyclical, recurring and potentially progressive pattern of pervasive sadness that is experienced by a client (parent or caregiver, or individual with chronic illness or disability) in response to continual loss, throughout the trajectory of an illness or disability.

RELATED FACTORS
Death of a loved one; Person experiences chronic physical or mental illness or disability such as: mental retardation, multiple sclerosis, prematurity, spina bifida or other birth defects, chronic mental illness, infertility, cancer, Parkinson's disease; person experiences one or more trigger events (e.g., crises in management of the illness, crises related to developmental stages and missed opportunities or milestones that bring comparisons with developmental, social, or personal norms); Unending caregiving as a constant reminder of loss

DEFINING CHARACTERISTICS

Subjective
Expresses one or more of the following feelings: anger, being misunderstood, confusion, depression, disappointment, emptiness, fear, frustration, guilt/self-blame, helplessness, hopelessness, loneliness, low self-esteem, recurring loss, overwhelmed; Client expresses periodic, recurrent feelings of sadness

Objective
Feelings that vary in intensity, are periodic, may progress and intensify over time, and may interfere with the client's ability to reach his/her highest level of personal and social well-being

SPIRITUAL DISTRESS

Diagnostic Division: Ego Integrity

Definition: Impaired ability to experience and integrate meaning and purpose in life through a person's connectedness with self, others, art, music, literature, nature, or a power greater than oneself.

RELATED FACTORS
Loneliness/social alienation; self-alienation; sociocultural deprivation; Anxiety; Pain; Life change; Chronic illness of self or others; Death and dying of self or others; [Challenged belief/value system (e.g., moral/ethical implications of therapy)]

DEFINING CHARACTERISTICS
Connections to Self

Subjective
Expresses lack of: Hope; meaning and purpose in life; peace/serenity; love; acceptance; forgiveness of self; courage; [Expresses] anger; guilt

Objective
Poor coping
Connections to Others

Subjective
Refuses interactions with friends, family/spiritual leaders; Verbalizes being separated from their support system; Expresses alienation

Connections with Art, Music, Literature, Nature

Subjective
Inability to express previous state of creativity (singing/listening to music/writing); No interest in nature; No interest in reading spiritual literature

Connections with Power Greater Than Self

Subjective
Inability to pray/participate in religious activities; sudden changes in spiritual practices; Expresses being abandoned by or having anger toward God; without hope, suffering; Request to see a religious leader

Objective
Inability to be introspective/inward turning; to experience the transcendent

SPIRITUAL DISTRESS, RISK FOR

Diagnostic Division: Ego Integrity

Definition: At risk for an altered sense of harmonious connectedness with all of life and the universe in which dimensions that transcend and empower the self may be disrupted.

RISK FACTORS
Physical or psychological stress; energy-consuming anxiety; physical/mental illness; situation/maturational losses; low self-esteem; blocks to self-love; poor relationships; inability to forgive; substance abuse; natural disasters

SPIRITUAL WELL-BEING, READINESS FOR ENHANCED

Diagnostic Division: Ego Integrity

Definition: Ability to experience and integrate meaning and purpose in life through connectedness with self, others, art, music, literature, nature, or a power greater than oneself

DEFINING CHARACTERISTICS
Connections to Self

Subjective
Desire for enhanced hope; Desire for enhanced meaning and purpose in life; Peace/serenity; Acceptance; Surrender; Love; Forgiveness of self; Satisfying philosophy of life; Joy; Courage; Heightened coping; Meditation

Connections with Others

Subjective
Requests interactions with spiritual leaders; Requests forgiveness of others; Requests interactions with friends and family

Objective
Provides service to others
Connections with Art, Music, Literature, and Nature

Objective
Displays creative energy (e.g., writing, poetry); Sings/listens to music; Reads spiritual literature; Spends time outdoors
Connections with Power Greater Than Self

Subjective
Prays; Reports mystical experiences; Expresses reverence and awe

Objective
Participates in religious activities

SUFFOCATION, RISK FOR

Diagnostic Division: Safety

Definition: Accentuated risk of accidental suffocation (inadequate air available for inhalation).

RISK FACTORS
Internal (individual)
Reduced olfactory sensation; Reduced motor abilities; Lack of safety education, precautions; Cognitive or emotional difficulties [e.g., altered consciousness/mentation]; Disease or injury process

External (environmental)
Pillow/propped bottle placed in an infant's crib; Pacifier hung around infant's head; Children playing with plastic bags or inserting small objects into their mouths or noses; Children left unattended in bathtubs or pools; Discarded or unused refrigerators or freezers without removed doors; Vehicle warming in closed garage [/faulty exhaust system]; Use of fuel-burning heaters not vented to outside; Household gas leaks; Smoking in bed; Low-strung clothesline; Eating of large mouthfuls [or pieces] of food

SUICIDE, RISK FOR

Diagnostic Division: Safety

Definition: Risk for self-inflicted, life-threatening injury.

RISK FACTORS
Behavioral:
History of prior suicide attempt; Buying a gun; Stockpiling medicines; Making or changing a will; Giving away possessions; Sudden euphoric recovery from major depression; Impulsiveness; Marked changes in behavior, attitude, school performance

Verbal:
Threats of killing oneself; States desire to die/end it all

Situational:
Living alone; Retired; Relocation, institutionalization; Economic instability; Presence of gun in home; Adolescents living in nontraditional settings (e.g., juvenile detention center, prison, half-way house, group home)

Psychological:
Family history of suicide; Abuse in childhood; Alcohol and substance use/abuse; Psychaiatric illness/disorder (e.g., depression, schizophrenia, bipolar disorder); Guilt; Gay or lesbian youth

Physical
Physical/terminal illness; Chronic pain

Social
Loss of important relationship; Disrupted family life; Poor support systems; Social isolation; Grief, bereavement; Loneliness; Hopelessness; Helplessness; Legal or disciplinary problem; Cluster suicides

DEFINING CHARACTERISTICS
To be developed.

SURGICAL RECOVERY, DELAYED

Diagnostic Division: Pain / Discomfort

Definition: Extension of the number of postoperative days required to initiate and perform activities that maintain life, health, and well-being.

RELATED FACTORS
To be developed.

DEFINING CHARACTERISTICS

Subjective
Perception more time is needed to recover; report of pain/discomfort; fatigue; loss of appetite with or without nausea; postpones resumption of work/employment activities

Objective
Evidence of interrupted healing of surgical area (e.g., red, indurated, draining, immobile); difficulty in moving about; requires help to complete self-care

SWALLOWING, IMPAIRED

Diagnostic Division: Food / Fluid

Definition: Abnormal functioning of the swallowing mechanism associated with deficits in oral, pharyngeal, or esophageal structure or function.

RELATED FACTORS

Congenital Deficits

Upper airway anomalies; mechanical obstruction (e.g., edema, tracheostomy tube, tumor); history of tube feeding; Neuromuscular impairment (e.g., decreased or absent gag reflex, decreased strength or excursion of muscles involved in mastication, perceptual impairment, facial paralysis); conditions with significant hypotonia; cranial nerve involvement; Respiratory disorders; congenital heart disease; Behavioral feeding problems; self injurious behavior; Failure to thrive on protein energy malnutrition

Neurological Problems

External/internal traumas; acquired anatomic defects; Nasal or nasopharyngeal cavity defects; Oral cavity or oropharynx abnormalities; Upper airway/laryngeal anomalies; tracheal, laryngeal, esophageal defects; Gastroesophageal reflux disease; achalasia; Premature infants; traumatic head injury; developmental delay; cerebral palsy

DEFINING CHARACTERISTICS

Subjective

Esophageal Phase Impairment

Complaints [reports] of "something stuck"; odynophagia; Food refusal or volume limiting; Heartburn or epigastric pain; Nighttime coughing or awakening

Objective

Oral Phase Impairment

Weak suck resulting in inefficient nippling; Slow bolus formation; lack of tongue action to form bolus; premature entry of bolus; Incomplete lip closure; food pushed out of/falls from mouth; Lack of chewing; Coughing, choking, gagging before a swallow; Piecemeal deglutition; abnormality in oral phase of swallow study; Inability to clear oral cavity; pooling in lateral sulci; nasal reflux; sialorrhea or drooling; Long meals with little consumption

Pharyngeal Phase Impairment

Food refusal; Altered head positions; delayed/multiple swallows; inadequate laryngeal elevation; abnormality in pharyngeal phase by swallow study; Choking, coughing, or gagging; nasal reflux; gurgly voice quality; Unexplained fevers; recurrent pulmonary infections

Esophageal Phase Impairment

Observed evidence of difficulty in swallowing (e.g., stasis of food in oral cavity, coughing/choking); abnormality in esophageal phase by swallow study; Hyperextension of head, arching during or after meals; Repetitive swallowing or ruminating; bruxism; Unexplained irritability surrounding mealtime; Acidic smelling breath; regurgitation of gastric contents or wet burps; vomitus on pillow; vomiting; hematemesis

THERAPEUTIC REGIMEN MANAGEMENT: INEFFECTIVE COMMUNITY

Diagnostic Division: Teaching / Learning

Definition: A pattern of regulating and integrating into community processes programs for treatment of illness and the sequelae of illness that are unsatisfactory for meeting health-related goals.

RELATED FACTORS

To be developed: [Lack of safety for community members]; [Economic insecurity]; [Health care not available]; [Unhealthy environment]; [Education not available for all community members]; [Does not possess means to meet human needs for recognition, fellowship, security, and membership]

DEFINING CHARACTERISTICS

Subjective

[Community members/agencies verbalize inability to meet therapeutic needs of all members]; [Community members/agencies verbalize overburdening of resources for meeting therapeutic needs of all members]

Objective
Deficits in persons and programs to be accountable for illness care of aggregates; Deficits in advocates for aggregates; Deficit in community activities for [primary medical care/prevention]/secondary and tertiary prevention; Illness symptoms above the norm expected for the number and type of population; unexpected acceleration of illness(es); Number of health care resources insufficient[/unavailable] for the incidence or prevalence of illness(es); [Deficits in community for collaboration and development of coalitions to address programs for treatment of illness and the sequelae of illness]

THERAPEUTIC REGIMEN MANAGEMENT: INEFFECTIVE FAMILY

Diagnostic Division: Teaching / Learning

Definition: A pattern of regulating and integrating into family processes a program for treatment of illness and the sequelae of illness that is unsatisfactory for meeting specific health needs.

RELATED FACTORS
Complexity of health care system; Complexity of therapeutic regimen; Decisional conflicts; Economic difficulties; Excessive demands made on individual or family; Family conflict

DEFINING CHARACTERISTICS

Subjective
Verbalized difficulty with regulation/integration of one or more effects or prevention of complication; [inability to manage treatment regimen]; Verbalized desire to manage the treatment of illness and prevention of sequelae; Verbalizes that family did not take action to reduce risk factors for progression of illness and sequelae

Objective
Inappropriate family activities for meeting the goals of a treatment or prevention program; Acceleration (expected or unexpected) of illness symptoms of a family member; Lack of attention to illness and its sequelae

THERAPEUTIC REGIMEN MANAGEMENT: EFFECTIVE

Diagnostic Division: Teaching / Learning

Definition: A pattern of regulating and integrating into daily living a program for treatment of illness and its sequelae that is satisfactory for meeting specific health goals.

RELATED FACTORS

NOTE: To be developed; [Complexity of health care management; therapeutic regimen]; [Added demands made on individual or family]; [Adequate social supports]

DEFINING CHARACTERISTICS

Subjective
Verbalized desire to manage the treatment of illness and prevention of sequelae; Verbalized intent to reduce risk factors for progression of illness and sequelae

Objective
Appropriate choices of daily activities for meeting the goals of a treatment or prevention program; Illness symptoms are within a normal range of expectation

THERAPEUTIC REGIMEN MANAGEMENT: INEFFECTIVE

Diagnostic Division: Teaching / Learning

Definition: A pattern of regulating and integrating into daily living a program for treatment of illness and the sequelae of illness that is unsatisfactory for meeting specific health goals.

RELATED FACTORS
Complexity of health care system/ therapeutic regimen; Decisional conflicts; Economic difficulties; Excessive demands made on individual or family; Family conflicts; Family patterns of health care; Inadequate number and types of cues to action; Knowledge deficits; Mistrust of regimen and/or health care personnel; Perceived seriousness/susceptibility/barriers/benefits; Powerlessness; Social support deficits

DEFINING CHARACTERISTICS

Subjective

Verbalized desire to manage the treatment of illness and prevention of sequelae; Verbalized difficulty with regulation/integration of one or more prescribed regimens for treatment of illness and its effects or prevention of complications; Verbalized that did not take action to include treatment regimens in daily routines/reduce risk factors for progression of illness and sequelae

Objective

Choice of daily living ineffective for meeting the goals of a treatment or prevention program; Acceleration (expected or unexpected) of illness symptoms

THERAPEUTIC REGIMEN MANAGEMENT: READINESS FOR ENHANCED

Diagnostic Division: Teaching/Learning

Definition: A pattern of regulating and integrating into daily living programs for treatment of illness and its sequelae that are sufficient for meeting health-related goals and can be strengthened

RELATED FACTORS

To be developed

DEFINING CHARACTERISTICS

Subjective

Expresses desire to manage the treatment of illness and prevention of sequelae; Expresses little to no difficulty with regulation/integration of one or more prescribed regimens for treatment of illness or prevention of complications; Describes reduction of risk factors for progression of illness and sequelae

Objective

Choices of daily living are appropriate for meeting the goals of treatment or prevention; No unexpected acceleration of illness symptoms

THERMOREGULATION, INEFFECTIVE

Diagnostic Division: Safety

Definition: The state in which the individual's temperature fluctuates between hypothermia and hyperthermia.

RELATED FACTORS

Trauma or illness [e.g., cerebral edema, cerebrovascular accident, intracranial surgery, or head injury]; Immaturity, aging [e.g., loss/absence of brown adipose tissue]; Fluctuating environmental temperature; [Changes in hypothalamic tissue, causing alterations in emission of thermosensitive cells and regulation of heat loss/production]; [Changes in level/action of thyroxine and catecholamines]; [Changes in metabolic rate/activity]; [Chemical reactions in contracting muscles]

DEFINING CHARACTERISTICS

Objective

Fluctuations in body temperature above or below the normal range; Tachycardia; Reduction in body temperature below normal rate; cool skin; pallor (moderate); shivering (mild); piloerection; cyanotic; nailbeds; slow capillary refill; hypertension

THOUGHT PROCESSES, DISTURBED

Diagnostic Division: Neurosensory

Definition: Disruption in cognitive operations and activities.

RELATED FACTORS

To be developed: [Physiologic changes, aging, hypoxia, head injury, malnutrition, infections]; [Biochemical changes, medications, substance abuse]; [Sleep deprivation]; [Psychological conflicts, emotional changes, mental disorders]

DEFINING CHARACTERISTICS

Subjective
[Ideas of reference, hallucinations, delusions]

Objective
Inaccurate interpretation of environment; Inappropriate/nonreality-based thinking; Memory deficit/problems [disorientation to time, place, person, circumstances, and events, loss of short-term/remote memory]; Hypervigilance/hypovigilance; Cognitive dissonance, [decreased ability to grasp ideas, make decisions, problem-solve, use abstract reasoning or conceptualize, calculate; disordered thought sequencing]; Distractibility [altered attention span]; Egocentricity; [Confabulation]; [Inappropriate social behavior]

TISSUE INTEGRITY, IMPAIRED

Diagnostic Division: Safety

Definition: Damage to mucous membrane, corneal, integumentary, or subcutaneous tissues.

RELATED FACTORS
Altered circulation; nutritional deficit or excess; [metabolic, endocrine dysfunction]; fluid deficit/excess; knowledge deficit; impaired physical mobility; irritants, chemical (including body excretions, secretions, medications); radiation (including therapeutic radiation); thermal (temperature extremes); mechanical (e.g., pressure, shear, friction); [infection]

DEFINING CHARACTERISTICS
Objective
Damaged or destroyed tissue (e.g., cornea, mucous membrane, integumentary, or subcutaneous)

TISSUE PERFUSION, INEFFECTIVE (SPECIFY TYPE): RENAL, CEREBRAL, CARDIOPULMONARY, GASTROINTESTINAL, PERIPHERAL

Diagnostic Division: Circulation

Definition: A decrease in oxygen resulting in the failure to nourish the tissues at the capillary level. [Tissue perfusion problems can exist without decreased cardiac output; however, there may be a relationship between cardiac output and tissue perfusion.]

RELATED FACTORS
Interruption of flow—arterial, venous; Exchange problems; Hypervolemia, hypovolemia; Mechanical reduction of venous and/or arterial blood flow; Decreased hemoglobin concentration in blood; Altered affinity of hemoglobin for oxygen; enzyme poisoning; Impaired transport of the oxygen across alveolar and/or capillary membrane; Mismatch of ventilation with blood flow; Hypoventilation

DEFINING CHARACTERISTICS
Renal
Objective: Altered blood pressure outside of acceptable parameters; Oliguria or anuria; hematuria; Arterial pulsations; bruits; Elevation in BUN/Creatinine ratio

Cerebral
Objective: Altered mental status; speech abnormalities; Behavioral changes; [restlessness]; changes in motor response; extremity weakness or paralysis; Changes in pupillary reactions; Difficulty in swallowing

Cardiopulmonary
Subjective: Chest pain; Dyspnea; Sense of "impending doom"; *Objective:* Dysrhythmias; Capillary refill greater than 3 sec; Altered respiratory rate outside of acceptable parameters; Use of accessory muscles; nasal flaring; chest retraction; Bronchospasms; Abnormal arterial blood gases; [Hemoptysis]

Gastrointestinal
Subjective: Nausea; Abdominal pain or tenderness; *Objective:* Hypoactive or absent bowel sounds; Abdominal distention; [Melena]

Peripheral
Subjective: Claudication; *Objective:* Altered skin characteristics (hair, nails, moisture); Skin temperature changes; Skin discolorations; skin color diminished; color pale on

elevation, color does not return on lowering leg; Altered sensations; Blood pressure changes in extremities; weak or absent pulses; Edema; Slow healing of lesions; Positive Homans' sign

TRANSFER ABILITY, IMPAIRED

Diagnostic Division: Safety

Definition: Limitation of independent movement between two nearby surfaces.

RELATED FACTORS
To be developed; [Conditions that result in poor muscle tone]; [Cognitive impairment]; [Fractures, trauma, spinal cord injury]

DEFINING CHARACTERISTICS
Impaired ability to transfer: from bed to chair and chair to bed, chair to car or car to chair, chair to floor or floor to chair, standing to floor or floor to standing, on or off a toilet or commode, in and out of tub or shower, between uneven levels

TRAUMA, RISK FOR

Diagnostic Division: Safety

Definition: Accentuated risk of accidental tissue injury (e.g., wound, burn, fracture).

RISK FACTORS
Internal (individual)
Weakness; Balancing difficulties; Reduced large, or small, muscle coordination, hand/eye coordination; Poor vision; Reduced temperature and/or tactile sensation; Lack of safety education/precautions; Insufficient finances to purchase safety equipment or to effect repairs; Cognitive or emotional difficulties; History of previous trauma

External (environmental) [includes but is not limited to:]
Slippery floors (e.g., wet or highly waxed); unanchored rug; litter or liquid spills on floors or stairways; snow or ice collected on stairs, walkways); Bathtub without hand grip or antislip equipment; Use of unsteady ladder or chairs; Obstructed passageways; entering unlighted rooms; Unsturdy or absent stair rails; children playing without gates at top of stairs; Unanchored electric wires; High beds; inappropriate call-for-aid mechanisms for bedresting client; Unsafe window protection in homes with young children; Pot handles facing toward front of stove; bathing in very hot water (e.g., unsupervised bathing of young children); Potential igniting of gas leaks; delayed lighting of gas burner or oven; Unscreened fires or heaters; wearing of plastic aprons or flowing clothing around open flame; highly flammable children's toys or clothing; Smoking in bed or near oxygen; grease waste collected on stoves; Children playing with matches, candles, cigarettes; Playing with fireworks or gunpowder; guns or ammunition stored unlocked. Experimenting with chemical or gasoline; inadequately stored combustibles or corrosives (e.g., matches, oily rags, lye; contact with acids or alkalkis); Overloaded fuse boxes; faulty electrical plugs, frayed wires, or defective appliances; overloaded electrical outlets; Exposure to dangerous machinery; contact with rapidly moving machinery, industrial belts, or pulleys; Sliding on coarse bed linen or struggling within bed [/chair] restraints; Contact with intense cold; overexposure to sun, sun lamps, radiotherapy; Use of thin or worn-out pot holders [or mitts]; Use of cracked dishware glasses; Knives stored uncovered; children playing with sharp-edged toys; Large icicles hanging from roof; High-crime neighborhood and vulnerable clients; Driving a mechanically unsafe vehicle; driving at excessive speeds; driving without the necessary visual aids; Driving after partaking of alcoholic beverages or [other] drugs; Children riding in the front seat of car, nonuse or misuse of seat restraints/[unrestrained infant/child riding in car]; Misuse [or nonuse] of necessary headgear for motorized cyclists or young children carried on adult bicycles; Unsafe road or road-crossing conditions playing or working near vehicle pathways (e.g., driveways, lanes, railroad tracks)

URINARY ELIMINATION, IMPAIRED

Diagnostic Division: Elimination

Definition: Disturbance in urine elimination.

RELATED FACTORS
Multiple causality, including: sensory motor impairment; anatomical obstruction; urinary tract infection; [mechanical trauma; surgical diversion; fluid/volume states; psychogenic factors]

DEFINING CHARACTERISTICS

Subjective
Frequency; urgency; Hesitancy; Dysuria; Nocturia; [enuresis]

Objective
Incontinence; Retention

URINARY ELIMINATION, READINESS FOR ENHANCED

Diagnostic Division: Elimination

Definition: A pattern of urinary functions that is sufficient for meeting eliminatory needs and can be strengthened

RELATED FACTORS
To be developed

DEFINING CHARACTERISTICS

Subjective
Expresses willingness to enhance urinary elimination

Objective
Urine is straw colored with no odor; Specific gravity is within normal limits; Amount of output is within normal limits for age and other factors; Positions self for emptying of bladder; Fluid intake is adequate for daily needs

URINARY RETENTION [ACUTE/CHRONIC]

Diagnostic Division: Elimination

Definition: Incomplete emptying of the bladder. [High urethral pressure inhibits voiding until increased abdominal pressure causes urine to be involuntarily lost, or high urethral pressure inhibits timely/complete emptying of bladder.]

RELATED FACTORS
High urethral pressure caused by weak [/absent] detrusor; Inhibition of reflex arc; Strong sphincter; Blockage [e.g., BPH, perineal swelling]; [Habituation of reflex arc]; [Use of medications with side effect of retention (e.g., atropine, belladonna, psychotropics, antihistamines, opiates)]; [Infections]; [Neurologic diseases/trauma]

DEFINING CHARACTERISTICS

Subjective
Sensation of bladder fullness; Dribbling; Dysuria

Objective
Bladder distention; Small, frequent voiding or absence of urine output; Residual urine [150 ml or more]; Overflow incontinence; [Reduced stream]

VENTILATION, IMPAIRED SPONTANEOUS

Diagnostic Division: Respiration

Definition: Decreased energy reserves results in an individual's inability to maintain breathing adequate to support life.

RELATED FACTORS
Metabolic factors; [hypermetabolic state (e.g., infection), nutritional deficits/depletion of energy stores]; Respiratory muscle fatigue; [Airway size/resistance; problems with secretion management]

DEFINING CHARACTERISTICS

Subjective
Dyspnea; Apprehension

Objective
Increased metabolic rate; Increased heart rate; Increased restlessness; Decreased cooperation; Increased use of accessory muscles; Decreased tidal volume; Decreased P_{O_2}; Decreased Sa_{O_2}; Increased P_{CO_2}

VENTILATORY WEANING RESPONSE, DYSFUNCTIONAL (DVWR)

Diagnostic Division: Respiration

Definition: Inability to adjust to lowered levels of mechanical ventilator support, that interrupts and prolongs the weaning process.

RELATED FACTORS
Physical
Ineffective airway clearance; Sleep pattern disturbance; Inadequate nutrition; Uncontrolled pain or discomfort; [Muscle weakness/fatigue, inability to control respiratory muscles; immobility]

Psychological
Knowledge deficit of the weaning process, patient role; Patient-perceived inefficacy about the ability to wean; Decreased motivation; Decreased self-esteem; Anxiety (moderate, severe); fear; insufficient trust in the nurse; Hopelessness; Powerlessness; [Unprepared for weaning attempt]

Situational
Uncontrolled episodic energy demands or problems; Inappropriate pacing of diminished ventilator support; Inadequate social support; Adverse environment (noisy, active environment, negative events in the room, low nurse-patient ratio, extended nurse absence from bedside, unfamiliar nursing staff); History of ventilator dependence >1 week; History of multiple unsuccessful weaning attempts

DEFINING CHARACTERISTICS
Responds to lowered levels of mechanical ventilator support with:

Mild DVWR
Subjective
Expressed feelings of increased need for oxygen, breathing discomfort, fatigue, warmth; Queries about possible machine malfunction

Objective
Restlessness; Slight increased respiratory rate from baseline; Increased concentration on breathing

Moderate DVWR
Subjective
Apprehension

Objective
Slight increase from baseline blood pressure 20 mm Hg; Slight increase from baseline heart rate 20 beats/min; Baseline increase in respiratory rate 5 breaths/min; Hypervigilance to activities; Inability to respond to coaching/cooperate; Diaphoresis; Eye widening, "wide-eyed look"; Decreased air entry on auscultation; Color changes: pale, slight cyanosis; Slight respiratory accessory muscle use

Severe DVWR
Objective
Agitation; Deterioration in arterial blood gases from current baseline; Increase from baseline blood pressure 20 mm Hg; Increase from baseline heart rate 20 beats/min; Respiratory rate increases significantly from baseline; Profuse diaphoresis; Full respiratory accessory muscle use; Shallow, gasping breaths; Paradoxical abdominal breathing; Discoordinated breathing with the ventilator; Decreased level of consciousness; Adventitious breath sounds, audible airway secretions; Cyanosis

VIOLENCE, [ACTUAL]/RISK FOR OTHER-DIRECTED

Diagnostic Division: Safety

Definition: Behaviors in which an individual demonstrates that he/she can be physically, emotionally, and/or sexually harmful to others.

RISK FACTORS
History of violence: against others (e.g., hitting, kicking, scratching, biting or spitting, throwing objects at someone; attempted rape, rape, sexual molestation, urinating/defecating on a person); Threats (e.g, verbal threats against property/person, social threats, cursing, threatening notes/letters or gestures, sexual threats); Antisocial behavior (e.g., stealing, insistent borrowing, insistent demands for privileges, insistent interruption of meetings; refusal to eat or take medication, ignoring instructions); Indirect (e.g., tearing off clothes, urinating/defecating on floor, stamping feet, temper tantrum; running in corridors, yelling, writing on walls, ripping objects off walls, throwing objects, breaking a window, slamming doors; sexual advances)

OTHER FACTORS
Neurological impairment (e.g., positive ECG, CT, or MRI; head trauma; positive neurological findings; seizure disorders, [temporal lobe epilepsy]); Cognitive impairment (e.g., learning disabilities, attention deficit disorder, decreased intellectual functioning); [organic brain syndrome]; History of childhood abuse/witnessing family violence, [negative role modeling]; cruelty to animals; firesetting; Prenatal and perinatal complications/abnormalities; History of drug/alcohol abuse; pathological intoxication, [toxic reaction to medication]; Psychotic symptomatology (e.g, auditory, visual, command hallucinations; paranoid delusions; loose, rambling, or illogical thought processes); [panic states; rate reactions; catatonic/manic excitement]; Motor vehicle offenses (e.g., frequent traffic violations, use of motor vehicle to release anger); Suicidal behavior, impulsivity; availability and/or possession of weapon(s); Body language: rigid posture, clenching of fists and jaw, hyperactivity, pacing, breathlessness, threatening stances; [Hormonal imbalance (e.g., premenstrual syndrome, postpartal depression/psychosis)]; [Expressed intent/desire to harm others directly or indirectly]; [Almost continuous thoughts of violence]

VIOLENCE, [ACTUAL]/RISK FOR SELF-DIRECTED

Diagnostic Division: Safety

Definition: Behaviors in which an individual demonstrates that he/she can be physically, emotionally, and/or sexually harmful to self.

RISK FACTORS
Age 15–19, over 45; Marital status (single, widowed, divorced) ; Employment (unemployed, recent job loss/failure); occupation (executive, administrator, owner of business, professional, semiskilled worker); Conflictual interpersonal relationships; Family background (chaotic or conflictual, history of suicide); Sexual orientation: bisexual (active), homosexual (inactive); Physical health (hypochondriac, chronic or terminal illness); Mental health (severe depression, psychosis, severe personality disorder, alcoholism or drug abuse); Emotional status (hopelessness, despair [lifting of depressed mood]; increased anxiety, panic, anger, hostility); history of multiple suicide attempts; suicidal ideation (frequent, intense, prolonged); suicide plan (clear and specific; lethality: method and availability of destructive means); Personal resources (poor achievement, poor insight, affect unavailable and poorly controlled); Social resources (poor rapport, socially isolated, unresponsive family); Verbal clues (e.g., talking about death, "better off without me," asking questions about lethal dosages of drugs; Behavioral clues (e.g., writing forlorn love notes, directing angry messages at a significant other who has rejected the person, giving away personal items, taking out a large life insurance policy); Persons who engage in autoerotic sexual acts [e.g., asphyxiation]

WALKING, IMPAIRED

Diagnostic Division: Safety

Definition: Limitation of independent movement within the environment on foot.

RELATED FACTORS
To be developed; [Condition affecting muscles/joints impairing ability to walk]

DEFINING CHARACTERISTICS
Impaired ability to walk required distances, walk on an incline/decline, or walk on uneven surfaces, to navigate curbs, climb stairs

WANDERING [Specify sporadic or continual]

Diagnostic Division: Safety

Definition: Meandering, aimless or repetitive locomotion that exposes the individual to harm; frequently incongruent with boundaries, limits, or obstacles.

RELATED FACTORS

Cognitive impairment, specifically memory and recall deficits, disorientation, poor visuoconstructive (or visuospatial) ability, language (primarily expressive) defects; Cortical atrophy; Premorbid behavior (e.g., outgoing, sociable personality; premorbid dementia); Separation from familiar people and places; Emotional state, especially frustration, anxiety, boredom, or depression (agitation); Physiological state or need (e.g., hunger/thirst, pain, urination, constipation); Over/understimulating social or physical environment; Sedation; Time of day

DEFINING CHARACTERISTICS

Objective

Frequent or continuous movement from place to place, often revisiting the same destinations; Persistent locomotion in search of "missing" or unattainable people or places; Scanning, seeking, or searching behaviors; Haphazard locomotion; Fretful locomotion or pacing; Long periods of locomotion without an apparent destination; Locomotion into unauthorized or private spaces; Trespassing; Locomotion resulting in unintended leaving of a premise; Inability to locate significant landmarks in a familiar setting; Getting lost; Locomotion that cannot be easily dissuaded or redirected; Following behind or shadowing a caregiver's locomotion; Hyperactivity; Periods of locomotion interspersed with periods of nonlocomotion (e.g., sitting, standing, sleeping)
